INDEX OF CONTENTS.

JANUARY TO JUNE, 1882.

A

ABELIA spatulata, 781
Abies amabilis, 400; A. Eicheleii, 145; A. Fortunei, 221; A. grandis, 400
Abutilon Boule de Neige, 534; A. Sclottianum variegatum, 470
Abutilons, seedling, 408; Mr. George's new, 370; in tubs, 191
Acaecia Drummondii in small pots, 189; A. grandis, 509; A. longiflora, 183
Academy, the Royal, 590
Acer obtusatum, and A. neapolitanum, 374; A. velutinum 2, 745, 744
Achimenes Verschaffelii, 780
Aerochane Ricinaria, 795
Adiantum Victoriani, 428; A. Williamsi, 46
Adiantums, groups of, 566
Advertisements, misleading, 599
Achmea Glaziosi, 781
Aegeria Duliciei, 401
Aerides cylindricum, 300; A. Lobbii, 807; A. suavisimum, 665
Afghanistan, the Flora of, 534
African Tuberoses, 474, 556, 600
Agaricus Boletus, an, 432
Agarics, notes on new species of, 186
Agavea caelestis, 119
Agave americana, 21
Albica Wakefieldii, 13
Alexandra Park, Manchester, the, 568
Alexander Peach, the, 569, 601, 643, 675, 704
Alkali, &c., Works Regulation Act, 21
Alabama Henriksen, on the continuous flowering of, 20
Albury House, Surbiton, 189
Almond, double dwarf, 527
Aloasia Johnstonii, 13; A. Putzeysi, 207
Alpine plants: Gentians, 670, 735; Rhododendrons, 258
Alps, the torrent region of, the 146
Alternanthera paronychioides aurea, 434
Amaryllis aulica, 23; Mrs. Garfield, 701
Amaryllis, the, 474; at Messrs. Veitch's, 257, 302, 339, 372
American blight, 340, 374; a preventative of, 192
American gardeners, 806
Amorpha Johnstonii, 13; A. Putzeysi, 207
Anastatica hierochuntica, 188
Anchusa italica, 768
Androsace acaulis, 566
Anemometers, 52; a historical sketch of, 410
Anemones apennina and ranunculoides, 401; Carteri's Empress, 599; A. coronaria alba, 639; A. nemorosa, 465; A. stellata flore-pleno, 340
Anemones, 334, 370; from the South of France, 372
Angleson House, Surbiton, 189
Angreem citratum, 222; A. descendens, 558; A. hyaloides, 222
Anguloa Clowessii, a fine specimen, 770; A. dubia, 764; A. Ruckeri sanguinea, 807
Anise tree of Japan, the sacred, 565
Anophyllum incanum, 464
Antericum gryptophyllum, 460
Anthurium Andreanum, 740; A. Scherzerianum Hendersonii, 56
Anubis, notes from, 16

Ants in the Peach-house, 228, 269, 343; on the utilisation of, in horticulture, 805
Ants nests, fungi of, 401
Apple arcades, 115
Apple, Cox's Pomona, 337; Golden Harvest, 337; the Irish Crofter, 308; Isle of Wight Pippin, 184; King of the Pippins, 13; King of the Pippins and Golden Winter Pearman, 308; Melba Carlo, 308; Sturmer Pippin, 360, 675; Winter Greening, 679; Winter Pearman, 13
Apple trees, lush, 598; canker in, 24, 56
Apples, dessert, 228; good sorts of, 13
Apricots in bloom in January, 89
Aralia leptophylla, 227; A. quanaefolia gracilis, 217; A. Schottii, 57
Araucaria, the, in the Island of Mull, 439
Arboretum, the, 260
Arboretum Szegevanum, 400
Artemisa sprucosum, 537
Arnebia Onitidis, 703
Arnica palustris, 438
Arum, white, 712; as Aquatics, 742
Asarum virginicum, 532
Ash and the Oak, 660
Ashton Court, Bristol, 734
Asia, the botany of Central and North-Eastern, 152; Central, the flora of, 120
Asparagus culture, 463; planting, 434
Aspidistra lurida variegata, 712
Asplenium Lillanum, 673
Asteriscus pygmaeus, 443
Astilbe Tumbigeri, 618
Atragene alpina, 678
Atriplex pumila, 261
Aulnactus at Cliswick, 659; notes on, 327, 438
Aucubas, 462; pollen of, 676
Auricula Richard Hadley, 634
Auricula, the, 779; Mr. Hilliard on the history of, the, 566; head, 634; and Polyanthus, 410; old varieties of, 514; in the North, 474; double white flowered, 120, 162, 229
Australian flowers, 406; Orchids, new, 461; plants, the genera of, 529
Asachi Apollo, 158; A. Mrs. Hunt, 774; A. pontica albastrucis, 444; A. rubifolia flore-pleno, 644; A. serpyllifolia, 429
Azaleas, early, 152; Glent, at Coombe Wood, 775

B

BARBANA tuliflora, 509
Baker, Mr. Geo., testimonial presented to, 226
Balsam, a new, 401
Balsams for amateurs, 742
Banana culture in France, 474
Barrington Hill, Essex, 55
Baskets, hanging, 190
Batatas paniculata, 268
Beaconsfield bottomholes, 532
Beans, Champion Runner, 149; kidney, 707; Mazagan, 223; Soy, 58

Beano d, a fine Peach tree at, 805
Bedding-out, hints on, 809
Bee looks, 25
Bees, the instinct of, 562; in Peach-houses, 408, 440, 473; the Willow for, 435
Best wine, 86
Begonia Daviesii, 268; B. discolor, 461; B. nutida, 86; B. Koezii, 183; B. socotrana, 108; B. undulata as a basket plant, 495
Begonias, sporting in, 224
Benthama frigifera, 828
Berberis Aquilulium as a hedge plant, 50; B. Darwini, 374, 527, 569; B. Darwini and B. stenophylla, 600; B. Darwini, 710; B. sanctus, 679; B. stenophylla, 527; B. vulgaris, 640
Berberis, evergreen, 473
Bignonia venusta, 71; B. caprolata var. atrosanguinea, 598
Birch, Silver, remarkable growth in a, 601
Bird flower of Mexico, the, 142
Birds and their habits, 5; and animals, habits of, 231; notes about, 269; small, on the decrease of, 102
Blackbirds and the slugs, 25, 152, 159, 164
Blims, raised, for Orchid-house, 526
Boilers, on cleaning, 643, 681; Mr. Reelford's, 23
Bolbophyllum mandibulare, 366
Bomax conferta, 156; B. Honda, 668; B. Shuttleworthii, 56; B. vitifolia, 143
"Bone tree," the, 468

BOOTS NOTICE—Eldonmore's Christowill, 81; Patience M. Sagonne, 84; Bonchard's How to Live on Nothing, 778; Bulletin de la Fédération des Sociétés d'Horticulture de Belgique, 475; Burrows' Agricultural Depression and How to Meet it, 811; Calvert's Mechanics' Almanac, 58; Cassell's Bible Educator, 475; Cassell's Familiar Garden Flowers, 58; Church's Laboratory Guide, 811; Cooke's British Fresh-water Alga, 148; Cooke's Freaks and Marvels of Plant Life, 45; Cooke's Illustrations of British Fungi, 58; Correspondance Botanique, 475; Davies' Practical Microscopy, 103; D'Ombrian's Rosarian's Year Book, 103; Ellwanger's The Rose, 738; Flore des Serres, 479; Forest and Pioneering, 84, 269; Gamble's Manual of Indian Timbers, 706; Goetze's Geography of Plants for Gardeners, &c., 103; Illustration Horticole, 84; Johnston's Atlas of Botany, 58; Journal of the Royal Horticultural Society, 84; Leighton's Wanderings of an Archaeologist amongst Old Churches, 58; Live Stock of the Farm, 148; M. Mpine's Botanical Atlas, 773; May's Press Manual, 475; Morton's Crops of the Farm, 811; Oliver's On and Off Duty, 379; Oliver's On Board a Union Steamer, 539; Packard's Insects Injurious to Forest and Shade Trees, 634; Paxton's Flower Garden, new ed., 475; Pfützer's Comparative Morphology of the Orchidee,

Banajo orientalis, 298
Botanical collectors: Geo. Barclay, 508
Botanic Garden of Santiago, the, 395
Botanical nomenclature, 304
Bongivillea speciosa, 538
Bouquet, a novel, 52
Bougainvillea, winter, 120
Bournemouth, gardening at, 16
Bouvardia Alfred Neuner, 53, 781; a new double pink, 469; on the culture of, the, 643
Bouvardias as exhibition plants, 83
Bov edgings, on laying, 265
Boxwood labels, 191
Brazil Bromelaeae, 224
Brick-kilns, effects of, on vegetation, 224
British, potatoes round, 462
British bee-keepers' Association, 270
Brush Guiana, 339; new plants from, 430
Broadlands, Hants, 163
Brocchia cordyliflora, 420
Brocoli, Leichard's Latest of All, 645; Veitch's Champion, 303; purple Sprouting, 301; Sutton's Late Queen, 777
Broomfield Orchids, the, 768
Brussels Sprouts, Aigliuth, 301
Bucklandia populnea, 499
Buffalo horn manna, 669
Bulbophyllum cupreum flavum, 330
Bulls, on forcing, 154; forced, on planting out, 537
Burdock, Japanese, 185
Burlingtonia cordata, 807

C

CABBAGE-TROSCOLI, Gilbert's, 17
Caladenia leptochila, 462; C. lobata, 464; C. macrostylis, 462; C. paniculata, 461; C. plicata, 464; C. reticulata, 462; C. tenuis, 464; C. unia, 461
Caladium tubers, on resting, 23, 404
Calanthe, on sowing the seeds of, 191
Calanthe Turneri, 48; C. Veitchii, 807
Calceolaria bicolor, 599; C. delicia, 509; C. Kayii, 829; hercynica, 812; hercynica, at Bedford Hill House, 678; Mr. James' strain of, 704
Calceolarias, spring struck, 59
Calycanthus floridus, 749
Callia corymbosa, 825
Callitriche, a curious, 826
Callula Kempferi, 803
Catasetum Christyanum, 583; C. Christyanum chloros, 628
Cathlyna amethystoglossa, 309; C. aurea, 375; C. citrina, 414; C. Dornaniana, 249; C. gigas, 801; C. galata Lepoldi, 808; C. habita bella, 700; C. Percivaliana, 796; C. Sanderiana, 802

Trichopilia suavis, 300; *T. suavis alba*, 336, 808
 Trockery in plants, 408, 439
 Trinity College Botanic Gardens, Dublin, 358
Troodia exigua, 260
Tritoma grandis in flower, 152
 Tripocolum Ball of Fire, 20; *T. Empress of India*, 781; *T. Hermione Grashoffi*, 569; *T. majus grandiflorum*, 742; *T. speciosum*, 192
Tropidocarpum, an abnormal pod of, 11
 Trowel, a garden, 712
Tsuga Pattoniana, 400, 682; *T. Hookeriana*, 145
 Tuberoses, on the culture of, 439, 710;
 African, 474, 536, 600
Tulipa chrysantha, 377; *T. Gesneriana*, 592; *T. sylvestris*, 536
 Tulip, the florists', 21, 155; the early, 682; early at Chelsea, 602; in Lancashire, 574; notes on, 748
 Turkistan plants, 340
 Tyso, Mr. Carey, death of, 223

U

UNITED Horticultural Benefit and Provident Society, 302, 341
Utricularia Humboldtii, 430

V

VALERIANA Phu-aurea, 601
 Vale Royal, the gardens at, 89
Vanda Cathartii, 192, 222; *V. Parishii*, 803; *V. Sanderiana*, 588
Vandas at Holloway, the, 49
 Vase, new floral, 711
Veratrum Maackii, 781
 Vegetables, new, 810, 835; new, of 1887, 111; north borders for, 712
 Vegetable products of Paraguay, 431
 Vegetable physiology, Mr. Darwin's Researches, 404
 Vegetation of Vesuvius and Etna, 21
 Vegetation of the Kufara group of oases, 152
 Veitch, Arthur, memorial fund, 224
 Verbena, the, 529
Veronica Hulkeana, 599; *V. pectinata*, 155
Victoria regia, on the growth of the leaves of, 181
Vinca variegata, 569
 Vineries, mildew in, 829
 Vines and Camellias in the same house, 192
 Vines, influence of magnesia salts on, 191; from Cochín China, 438; root space for, 191
Viola altaica, 808; *V. pedata* and *V. pedata tricolor*, 744

Viols, White Czár, in pots, 340
 Virginia Stock, the Fairy Queen, 801
Vitis Lecardii, 781
Vitis scutalis, 268

W

WAHLENBERGIA saxicola, 828
 Walks, edgings to, 537
 Wall copings, 23, 88
 Wallflowers, 465; double, 766
 Walls, plants for covering, 90, 807
 Wall protectors, glass, 89
 Wall trees, protection for, 57
 Wasps, 777
 Waste lands in India, 736
 Water, manures as absorbents of, 641, 670
 Watson's Topographical Botany, 54
 Weather of 1881, the, 469; a warning, 57; aspects in June, 804
 Weigela, a floriferous, 766
 Weizschel, the germination of, 14
 Wheat mildew and Barberry blight, 21
 Whetstone, Grape growing at, 79
 White Broom for forcing, 343
 Whitechurch Rectory, Edgware, 190
 Wild flowers, 438
 Wine, Beet, 86
 Winter Aconite, the, 192

Winter flowers at Swanley, 153
 Winter, the mild, in Banffshire, 568
 Winters of 1760-61 and 1881-82, 376; severe, local conditions in relation to the effects of, on plants, 189
Wistaria sinensis, large specimens of, 344, 602, 642, 681, 741; *W. sinensis flare-pleno*, 808
 Wood manufacture at Wisbeach, 335
 Wolsley Grange, Esher, 110
 Wooden walls, 185
 Woodsia Plummerae, 150
 Woods, on thinning, 528
 Worm-casts, nitrogen in, 53

Y

YORK Nurseries, the, 599

Z

ZAMIA montana, 460; *Z. obliqua*, 460
Zephyranthes citrina, 781
Zygopetalum Gautieri, 828; *Z. maxillare* at Clapton, 562

LIST OF ILLUSTRATIONS.

- A**
AFERITA Dutheil, 401
Acridis Schroederi, 341
Agaricus-Boletus, an, 432
Agaric, a Morrel-like, 307
 Agave-house at Kew, the, 773
 Alexander Peach, the, 705
Angraecum Scottianum, 342
 Ants' nests, fungi of, 401
- B**
 BARRINGTON Hall, Essex, 53
Bomarea conferta, 187; *B. Irondeia*, 669;
B. Shuttleworthii, flowers of, 85; tubers
 of, 77; *B. vitell* n, 151
 Bothy at Lambton, the, 529
Bouvardia, a specimen plant of, 89
 Bulb upon bulb in *Leucocium*, 135
- C**
CAPILLA a gigas, 313
 Ceylon Botanic Garden, india-rubber trees
 in the, 265
 Cherry trees, diagrams of trained and
 untrained, 800, 801
 Chiswick, the great vinery at, 10
Cecylogyne Massangeana (see supplement-
 al sheet with No. 429, March 18)
Columna Kallreyeriana, 217
 Cones, proflerous, of *Larix*, Douglas Fir,
 and *Sciadopitys*, 112, 113
Coryanthes elegantissima, 507; structural
 details of, 503
 Cragside, Northumberland, 437
 Crug-y-nos Castle, view of, 469; the
 conservatory at, 465
Cymbidium chrysocoma, 497
- D**
DAPHNE Blagayana, 505
 Darwin, the late Charles, portrait of (see
 supplemental sheet with No. 434,
 April 23)
Dendrobium densiflorum, 737; *D. for-*
mosum giganteum, 369; *D. Leechian-*
um, 256
Disa grandiflora, a seedling plant of, 402
Doryanthes Palmieri, 499
Dracaena elliptica maculata in flower, 261;
D. Goldiana, inflorescence of, 49
- E**
ELAPHOGLOSSUM Backhousianum, 673
Eudendia eminens, 557
- F**
 FLINCE, a self-supporting, 809
 Fruit within a fruit, a, 11, 601
 Fungi of ants' nests, 401
- G**
GALFANORA rivalis, 537
 Gardener's cottage at Lambton, 533
 Garden seat and table, a reflex, 439
 Glasgow Botanic Garden, the new range
 in the, 221
 Grasses, a new disease of, 377
- H**
HELICOCORYNE ramosa, 463
 Hoya, fertilisation of, 570
Hoya globulosa, 741
- I**
 INDIA-RUBBER trees in the Botanic Gar-
 den, Ceylon, 265
Isana ficiformis, 377
- J**
 JODRELL Laboratory at Kew, the, 562
- K**
KEMFERERIA Gilberti, 713
 Kew, the Agave-house at, 773; the
 Jodrell Laboratory at, 562; the Mari-
 anne North Gallery at, 705; the tem-
 perate-house at, 639
 Kimbolton Castle, 121
- L**
 LAMBTON Castle, the bothy at, 529; the
 gardener's cottage at, 533

 Lygodieton Forest, 330, 331
- M**
 MAMHEAD House, Devon, 805
 Marianne North Gallery at Kew, the,
 705
 Marnock, Mr. Robert, portrait of, 565
Masdevallia rosea, 614
Medinilla amabilis, 564
 Moore, Mr. Thomas, portrait of, 509
 Mustard, Indian, fruit within a fruit, 601
 Myosotis seeds, 307
- N**
 NAUDIN, M. Charles, portrait of, 183
Narcissus Masterianus, 472
Nepenthes atro-sanguinea, 827; *N. Dor-*
manniana ×, 525; *N. larsuta* var.
glabrescens, 399; *N. intermedia*, 178;
N. Kennedyana, 257; *N. Rutiliflora*,
 178; *N. rubro-maculata*, 113; *N.*
Wigleyana, 143
- O**
 OSBARI CHILD foot growth, 147
Odontoglossum lyroglossum 612. (see
 also supplemental sheet with No. 437,
 May 13)
Olearia Gunniana, 733
 Orehid-house, Mr. Bull's, 833
 Oxton House, Devon, 633
- P**
 PAPER boxes, how to make, 833
 Parson Drove, an old Wood Mill at,
 331, 335, 339
Panicum involutus, 432
 Peach, the Alexander, 705
- Pescatorea Lehmanni**, 45
Pieris japonica, 707
 Pine-apples, proflerous, 373, 405
Pinus Cembra in the Valley of Turtmann,
 81; an ancient, 80
 Pod within a pod, a, 11
 Powderham Castle, Devon, 589
- R**
 RHODODENDRON *campanulatum hybrid-*
um at Singleton, 701; *R. dahuricum*,
 295; *R. grande* (see supplementary
 sheet with No. 441, June 10); *R.*
Hookeri, 629; *R. pendulum*, 429; *R.*
precox, 295
 Ridgway's lawn-edge cutter, 612
 Root-growth obstructed, 147
- S**
SALIX *Basfordiana*, 298
Sciadopitys, normal and proflerous cones
 of, 112, 113
 Singleton, *Rhododendron campanulatum*
 hybridum, at, 701
 Succulent-house at Kew, the, 773
Streptocarpus Greenii?, 393

ADDRESS—

CRANSTON'S NURSERY and SEED CO. (LIMITED),

KING'S ACRE, NEAR HEREFORD.

O N I O N .

CRANSTON'S EXCELSIOR.

NOVELTY 1882.

First-class Certificate, November 16, 1880.

We have pleasure in now being able to offer to the Trade Seed of this grand new variety, which we are confident will at once establish itself as the finest Onion ever raised. It has a very handsome globe-shaped bulb, with exceedingly small neck, and of a beautiful pale straw colour; it possesses mild flavour, and excellent keeping qualities. The Excelsior has been grown alongside the most popular varieties of spring and winter Onions, and proved superior in every respect, many specimens weighing over 2 lb.

It possesses several decided advantages over all others, which must secure for it general cultivation.

Per packet, 1s. 6d.

TRADE PRICE ON APPLICATION.

CRANSTON'S

NURSERY & SEED COMPANY (LIMITED), HEREFORD.

A LIST of our AGENTS will be published in Spring

WHOLESALE SEED CATALOGUE.

ORCHIDS.

The Largest and Best Stock in Europe of good Established Plants. Tens of Thousands of Plants to select from.

MR. WILLIAM BULL

Begs to intimate that his Orchid-houses are always quite a sight, from the large number of plants in flower, and he will be pleased to show them to any one interested in this beautiful class.

MR. WILLIAM BULL

Recommends those desirous of having their Houses gay with Orchid flowers, to purchase good established well-cultivated plants, which bloom well, are far more satisfactory, and comparatively cheaper than newly imported or semi-established plants.

Establishment for New and Rare Plants, 536, KING'S ROAD, CHELSEA, LONDON, S.W.

LAXTON'S "JOHN BULL" PEA,

A new 3-foot main crop blue-wrinkled variety, is

- The Finest and Best for Exhibition!
- The Best for Flavour and Quality!
- The Best for a Heavy Crop!
- The Best for General Cultivation!

Mr. R. DRAPER, *The Gardens, Seaham Hall* (a well-known authority on Peas, and who has tested the new varieties annually for many years past), writes spontaneously:—"What a grand Pea your John Bull is—the very best Pea out; which is saying a great deal for it."

Price, 3s. 6d. per sealed half-pint.

LAXTON'S MINIMUM PEA.

The dwarfest and earliest dwarf wrinkled Pea, very prolific, and the best of all for forcing.

Price, 2s. 6d. per sealed half-pint.

(PROVISIONALLY NAMED).

MR. J. C. STEVENS will **SELL** by **AUCTION,** at his Great Rooms, 38, King Street, Covent Garden, W.C., on **TUESDAY NEXT,** January 10, at half-past 12 o'Clock precisely, by order of Mr. F. SANDER, St. Alban's, a splendid **CATTLEYA,** believed to be new. There is no other **Cattleya** known to us with such gigantic bulbs, leaves, and flower-spikes as this species. It will be seen that some of the bulbs measure 4 inches in circumference; some of the spikes are 15 inches long, and show as many as eight large flower-seats. The species is extremely free flowering, almost every bulb on the plant having flowered. Individually the flowers measure from 5 to 8 inches across; sepals and petals deep rose, often purple; lip finely fringed, large, lower part crimson-purple; centre, golden-yellow—in some varieties very little of the yellow is seen. The importation is in fine health.

May be viewed the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

THURSDAY NEXT.—(Sale No. 6035.)

PHALÆNOPSIS STUARTIANA and CHOICE BRAZILIAN ORCHIDS.

MR. J. C. STEVENS will **SELL** by **AUCTION,** at his Great Rooms, 38, King Street, Covent Garden, W.C., on **THURSDAY NEXT,** January 12, at half-past 12 o'Clock precisely, by order of Messrs. **HUGH LOW & Co.,** three healthy established plants of the new and lovely

PHALÆNOPSIS STUARTIANA,

Fully described in *Gardeners' Chronicle,* December 10, 1881.

Also, imported plants of **CATTLEYA LABIATA** varieties, a large number of which were seen in flower by the Collector, in **NOVEMBER LAST,** and fine varieties marked by him will be offered. The plants vary much in appearance as to size and colour of bulbs and leaves, and it is doubtful if such a promising lot has been previously offered—some of the specimens are of large size, and all in the best possible condition.

At the same time will be offered good plants of **ONCIDIUM CURTUM,** splendid specimens of **O. MARSHALLIANUM, O. CONCOLOR,** **CATTLEYA SCHILLERIANA, LELIA HARPOPHYLLA, LÆLIA** received as **TRUE PRÆSTANS,** and other **CHOICE ORCHIDS.**

May be viewed the morning of Sale, and Catalogues had.

STERLING

Pronounced by the Royal Horticultural Society
and other acknowledged Authorities to be

THE BEST of their CLASS,
WHETHER FOR EXHIBITION

Carter's New Golden Queen

Onion.—A perfect Model of an Onion. Skin a delicate straw colour. Price, in sealed packets, 1s. 6d. and 2s. 6d.

Carter's New Silver Ball Onion.

—A very distinct silver-skinned Tripoli Onion, growing to the size of a Snowball Turnip. Price, in sealed packets, 1s. 6d. and 2s. 6d.

Carter's Golden Globe Onion.

—A splendid Exhibition variety. The skin is a transparent golden-straw colour. Price, in sealed packets, 1s. 6d. and 2s. 6d.

Carter's Blenheim Orange Melon

—The finest scarlet-fleshed Melon in cultivation. Awarded First-class Certificate Royal Horticultural Society. Price, in sealed packets, 1s. 6d., 2s. 6d. and 3s. 6d. per packet.

Culverwell's Telegraph Pea.

—An indispensable exhibition variety. Price, in sealed packets, 2s. 6d. per pint.

Carter's Stratagem Pea.—The

only Pea awarded a First-class Certificate by the Royal Horticultural Society in 1879. Price, in sealed packets, 3s. per pint.

CARTERS' ILLUSTRATED VADE MECUM for 1882

Price, One Shilling; Post-free for Fifteen Stamps, Gratis to Customers.

NOVELTIES.

Pronounced by the Royal Horticultural Society
and other acknowledged Authorities to be

THE BEST of their CLASS,
OR TABLE.

Carter's Telephone Pea.—

Awarded a First-class Certificate by the Royal Horticultural Society. Price, in sealed packets, 2s. 6d. per half-pint.

Carter's Pride of the Market

Pea.—Awarded a First-class Certificate by the Royal Horticultural Society, 1881. Price, in sealed packets, 3s. per pint.

Monster Long-podded Negro

Bean.—Awarded First-class Certificate Royal Horticultural Society, 1879. Price, in sealed packets, 2s. per pint.

Carter's Leviathan Bean.—

Produces enormous Pods, 12 to 16 inches long. Takes First Prizes wherever exhibited. Price, in sealed packets, 2s. 6d. per pint.

Carter's Longsword Dwarf Bean.

—A second Canadian Wonder, but earlier and more fruitful than that splendid variety. Price, in sealed packets, 2s. 6d. per pint.

Carter's Defiance Cauliflower.

—The earliest variety in cultivation. Price, in sealed packets, 1s. 6d. and 2s. 6d. per packet.

Carter's Dedham Favourite

Tomato.—Awarded a First-class Certificate Royal Horticultural Society, 1881. Price, in sealed packets, 2s. per packet.

ONE HALF THE NATURAL SIZE.

FLOWER SEED NOVELTIES

For 1882.

Williams' Little Gem Capsicum .. per packet—s. d. 1 6

A winter decorative plant of great merit, very effective in any situation where a bright colour is required. It produces a profusion of scarlet-coloured, Currant-shaped berries, which rise prominently above the foliage. Awarded a First Class Certificate of Merit.

Williams' Primula sinensis fimbriata "Meteor" .. 3s. 6d. and 5 0

A new variety, of compact habit; the leaf-stalks have a reddish tinge, with leaves deeply cut and of a dark green hue. The blooms are well fimbriated, of medium size, good form and substance, with colour of an intense rich crimson, relieved by a bright yellow eye. Awarded two First-class Certificates of Merit.

Williams' Primula sinensis fimbriata alba "magnifica" .. 2s. 6d., 3s. 6d. and 5 0

Williams' Primula sinensis fimbriata "Chiswick Red" .. 2s. 6d., 3s. 6d. and 5 0

Williams' Primula sinensis fimbriata rubro violacea .. 2s. 6d., 3s. 6d. and 5 0

Williams' Primula sinensis fimbriata "cocci-neae" .. 1s. 6d., 2s. 6d., 3s. 6d. and 5 0

Williams' Prize Cockscomb .. 2s. 6d. and 5 0

Awarded, last autumn, a First-class Prize at the Grand International Horticultural Exhibition, held in the Royal Botanic Gardens, Manchester.

Williams' Cyclamen persicum "Brilliant" .. 2s. 6d., 3s. 6d. and 5 0

Williams' Cyclamen persicum "giganteum" .. 2s. 6d., 3s. 6d. and 5 0

Williams' Cyclamen persicum "giganteum rubrum" .. 2s. 6d., 3s. 6d. and 5 0

VEGETABLE SEED NOVELTIES

For 1882.

Williams' "Nowton Court" Melon .. per packet—s. d. 2 6

A green-fleshed seedling of hardy constitution and very fine flavour. Highly commended.

Williams' "Semper Fidelis" Melon .. 2 6

A scarlet-fleshed seedling, very handsome and remarkably juicy.

Williams' Holloway Rival Pea .. per ½ pint 2 6

An early wrinkled variety of great merit, about 2½ feet high, first-rate cropper and very prolific.

Williams' Prolific Dwarf French Bean .. per quart 2 6

Williams' Alexandra Broccoli .. per pkt. 1 0

Williams' Improved Dwarf Brussels Sprouts .. 1 0

Williams' Early Nonsuch Cabbage .. 1 0

Williams' Matchless Red Celery .. 1 0

Williams' Matchless White Celery .. 1 0

Williams' Gloria Mundi Endive .. 1 0

Williams' Victoria Cos Lettuce .. 1 0

Williams' Magnum Bonum Onion .. 1 6

Williams' Emperor of the Marrow Pea .. per quart 2 6

Illustrated Seed Catalogue for 1882

Now published, and can be had, post-free, on application.

All orders are executed from Seeds of unequalled excellence; those amounting to 20s. in value and upwards are forwarded carriage paid to any railway station in England or Wales, and all orders of 40s. or more in value to any railway station in Scotland, or steam-shipping port in Ireland.

Flower Seeds, excepting heavy kinds, Post-free.

SATURDAY, JANUARY 7, 1882.

THE BEST NOVELTIES OF 1881.

THE year 1881, ere it was laid low by the sickle of the Great Reaper, had furnished us with many pleasant leaflets, and many beautiful blossoms, some of the more striking of which it is now our task to gather up and store for future use, while they are still fresh in our recollection. Let us commence with those princes of the vegetable world, the regal

PALMS.

One of the prettiest novelties among these is the New Caledonian Kentiopsis divaricata, which has pinnate leaves, the leaflets of which are broadish and alternate; the leaves when first developed are of a rich brownish-red colour, and in this stage the plant is very effective. Another new pinnate Palm is the Pinanga patula from Sumatra, which has a dwarf, slender stem from 5 to 6 feet high, the leaves 4 to 5 feet long, with broadish leaflets. In Synchantaia fibrosa, from Guatemala, we have another dwarf and graceful species, with a trunk 4 feet high, and a crown of pinnate leaves, the linear-lanceolate leaflets of which are from 1—1½ foot long; the flowers of this Palm are succeeded by orange-red drupes. Ravena Hildebrandtii, from Johanna Island, attains to 10 or 12 feet in height, and its pinnate leaves are made up of numerous narrow lanceolate leaflets. In Nunnezharia tenella we get what has been designated as perhaps the dwarfest known Palm, the entire plant, in a fruit-bearing condition, being only 9 inches high; its obovate-oblong nervose leaves are bifid at the extremity, and the yellow flowers are produced in long drooping slender spikes, almost as long as the plant itself. The beautiful Pritchardia grandis, which has figured with such excellent effect in Mr. Bull's prize collections, has been named Licuala grandis by Mr. Wendland.

FERNS.

Some important additions have been made to this popular group, both amongst imported species and garden varieties. The Sagenia Lawrenceana, a bold Madagascar Aspidioid species mentioned last year, is remarkable for its ample pinnato-pinnatifid fronds, its black shining stipes, and its prominent sori. Plectipeltis Niphias, from the islands of the South Pacific, is a rather striking Fern amongst the simple fronded species, its fronds being obovate with a long narrow point or cusp, and thus altogether very like in outline to the profile of a swordfish, whence the name; the back of the frond is dotted over with rather prominent sori. Lastrea Richardsii multifida, a finely tasselled Fern from Polynesia, is remarkably like the Aspidium obliquatum Germinyi which has been published from the Continental collections. Asplenium Baptistii and Asplenium apicidens are both welcome additions from the South Sea Islands. The former is the larger grower, with leathery evergreen fronds 1½ foot long, bipinnate, with a few long, narrow pinnae, having linear-toothed pinnales. The latter is a pinnate Fern, a foot high, more in the way of A. Vieillardii (schizodon), but differs in the direction of the

veins and sori. The *Davallia fijiensis plumosa* is perhaps one of the most elegant of all known Ferns. The species itself is a strong growing one, with fronds of considerable size, and in the ordinary form is very beautiful, on account of the finely-cut segments; but this form—apparently one of several met with in its wild habitats—is peculiarly graceful in its very fine divisions and its plummy, somewhat pendent habit. Another beautiful acquisition is the *Gymnogramma schizophylla*, a finely-cut Jamaica evergreen species, with oblong tripinnatifid fronds, which are forked and proliferous in the upper part; it is exceedingly well adapted for basket culture. Of the hardier race—probably both of them hardy under favourable conditions—are the neat-habited *Polypodium Kramerii*, analogous to our own *P. phegopteris*; *Lastrea* (not *Lastrea*, as many persons persist in writing it) *Maximowiczii*, the analogue of *Lastrea dilatata*; and *Polystichum tripterum*, a singular Fern, with two enlarged basal pinnae, evergreen, and elegant in character: all three are Japanese.

Of garden origin we have some few new varieties which are really acquisitions. We specially note *Davallia elegans polydactyla*, raised by Mr. Schneider in Messrs. Veitch & Sons' nursery; it is, like the type, an evergreen plant, with glossy green fronds of coriaceous texture, having the apex as well as the tips of the pinnae divided in a multifid or many-fingered manner. *Adiantum cuneatum grandiceps* is a finely tasselled form of the extremely popular *A. cuneatum*. *Adiantum Lathomii* is a very ornamental form—hybrid or sport—obtained by Mr. Bause for the General Horticultural Company; it comes nearest to *Adiantum Ghiesbreghtii* (*alios scutum*), but has a more drooping habit, and is as useful amongst the bolder Maiden-hairs for decorative purposes as *A. cuneatum* is amongst those of more slender habit.

ORCHIDS

afford a much fuller choice of materials. These lovely and grotesque subjects appear to have lost none of their popularity; indeed, if we may judge from the Orchid Notes in our own and other journals, and from the separate publications devoted to them, we may well believe it to be on the increase. Amongst the novelties of the year probably *Phalenopsis Stuartiana* (*Gardeners' Chronicle*, xvi., 753, fig. 149) deserves the first mention. It is a splendid species, with the young leaves mottled with silvery-grey, and bears immense panicles of fine white prettily spotted flowers, the peculiarity of the plant lying in these spottings of crimson which, on the lower half of the sepals, are on a yellow ground, as they are also on the centre lobe of the lip, the tip of the lateral lobes of the lip being white. *Phaius tuberculatus* (*Gardeners' Chronicle*, xv., 341, fig. 67) is a most beautiful and distinct plant, the flowers reminding one somewhat of those of *Alpinia nutans*; it has plaited leaves and erect racemes of large showy white flowers, of which the lip has two large yellow side lobes spotted with purple-brown, and the middle lobe has prominent yellow crests, and its mauve-coloured or rosy at the edge; it comes from Madagascar. The group of *Acridies* has received a welcome accession in the *A. Lecanum*, which has dense drooping racemes of amethyst-coloured fragrant flowers; while to the *Saccolabium* has been added *S. Grafii*, a very fine species from the Fiji Islands, producing spikes of deep purple flowers. *Odontoglossum Marriottianum*, with panicles of large white flowers with numerous small purple spots on the sepals and petals and a yellow disc to the lip, a handsome plant from the United States of Columbia, is perhaps a natural hybrid between *Hallii* and *crispum*. *Odontoglossum excellens* is another fine plant, suggestive of a yellow *Pescatorei*, the sepals being yellow and brown with a white central area, the petals white with a yellow margin, the lip

white with yellow crests and purple blotches. *Odontoglossum Williamsianum*, which is of another character, being in the way of grande, but with broader petals, is a nice addition to this set. There are many more fine *Odontoglossum* on the list of last year's novelties but we have only further space to note *Odontoglossum Rossii rubescens*, a grand form of great beauty, with the flowers larger than in *Rossii majus*, the ground-colour of a light rosy tint, and the marblings of a deep purple turning to chestnut-brown. In *Calanthe bella*, bred between Veitchii and Turneri, we have a pretty Veitchian hybrid, with flowers of a pale lilac-rose, having a deep carmine eye; while another pretty hybrid of the same genus occurs in *Calanthe Sandhurstiana*, which has flowers in the way of those of Veitchii, but with an eye-spot at the base of the lip. Of another character altogether is the *Trichocentrum Flavii*, a Trichopilia-like plant from Central America, a pretty species with the flowers in pairs, the spatulate sepals and petals half brown, half white, the fimbriate lip crisp, white, with a rich red blotch on its unguis or claw. The *Pescatorei* have received an accession in *Pescatorea Dormaniana*, a fine species in the way of *Klabochorum*, from Columbia, one of those having the lip covered with papillae, the flowers white, with three median prolonged keels of a sulphur-yellow, the tips of the sepals being also sulphur-coloured. To the *Pleione*s must be added the beautiful *Pleione Arthuriana*, a Burmah species in the way of *maculata*, but with one or two long conspicuous lines on the petals, and a deep purple-mauve border to the front lobe of the lip, the pseudobulbs deep purple, with numerous light green spots. *Crologyne cristata hololeuca*, a variety with the crests of the lip white, though perhaps not superior to the type will, nevertheless, be useful where pure white flowers are desired. *Cymbidium eburneum Williamsianum* is a very handsome variety of a well-known species which occupies a place in the front rank of the Orchids; in this the front lobe and the tips of the two side lobes of the lip are purple, which adds much to the beauty of the flowers. Of hybrid Lady's Slippers the name now is legion, one of the best of recent acquisitions being *Cypripedium tessellatum porphyreum*, which has very finely marked leaves, and flowers suffused with the richest deep purple-brown on the sepals and petals and on the border of the lip; altogether it is a great improvement on the original *tessellatum*, though it came out of the same seed-pod. The *Anguloa purpurea* of the *Illustration Horticole* is simply the same thing as the already well-known *Anguloa Ruckeri sanguinea*. *T. Moore*.

(To be continued.)

New Garden Plants.

MASDEVALLIA PICTURATA, Rehb. f.

This is a very small species, but a gem par excellence. The tuft of small leaves seldom exceeds 2 to 3 inches in height. The peduncles are equal in length to the leaves, and one-flowered. The ribs of the small ovaries are exceedingly wavy; sepals totally free one from another, whitish, with green nerves, very oblong, with long green tails, and fine blackish-mauve spots on the oblong part; lateral sepals with orange at the base. The petals are very curious, falcate, with a strong tooth at the top, and a small one below it on each side, and a blunt one over the base in front; upper half white over the median vein, lower light sulphur. The lip has rounded side lacinia, and a ligulate central lacinia ending in three knobs, the middle one being more developed. Column light green. This lovely thing is just to hand, kindly sent by Mr. Fred. Sander. I do not know anything of its having flowered before in Europe. It has been collected by Wagener, Fendler, and Arnold. *H. G. Rehb. f.*

SUNBURY NURSERY.

Most people connected with horticulture have been long acquainted with Messrs. Osborn & Sons' well-known nursery establishment at Fulham, London, but their Sunbury nursery, where extensive additions to the glass department and important improvements in the grounds are now in progress, is not perhaps so familiar to the horticultural public. The Sunbury nursery is but a few minutes' walk from the station of the same name on the South-Western Railway. It is also easily reached from Paddington by way of Richmond via the District Railway. The private and business entrances to the nursery are off the road to which the nursery has given its name—Nursery Road, or the Staines and Windsor Road. The private entrance for foot passengers is naturally made as attractive as possible with the finest ornamental plants and Conifers, which seem to have been carefully selected for the purpose. They comprise a choice assortment of variegated and other Hollies, amongst them fine samples of Golden Queen, *Picea lasiocarpa* (a rather peculiar type of this variety, having a great resemblance in colour to *P. nobilis*), golden-capped Irish Yews, *Thuopsis luteivernis*, berried Aucubas, *Magnolia Soulangiana*, *Cupressus Lawsoniana lutea*, and many varieties of *Retinospora*, conspicuous either for symmetry of form or for colour. I should have stated that *Magnolia Soulangiana* is perfectly hardy as a bush without protection of any kind in the severest winters, and makes a charming flowering bush for pleasure or ornamental grounds of any kind.

Leaving the glass structures upon the left, the ornamental borders continue slightly varied in arrangement, with different kinds of trees and flowering shrubs, which are intermixed with small ornamental plants and choice Conifers, from 1 to 3 feet in height. Golden weeping Hollies are here in large numbers, Golden Irish Yews, *Populus canescens pendula*, the purple-leaved Birch, *Picea Nordmanniana*, *P. nobilis*, gaudis, and others; *Cryptomeria elegans*, *Retinospora ericoides*, very chaste in form, and well coloured; *Yucca gloriosa glaucescens*, and a host of other plants, remarkable for beauty of form or colour. The borders are edged with a broad band of the lovely *Gentiana acuta*—one of the prettiest spring flowering plants in cultivation. At the southern extremities of these borders are two long rows of pyramid fruit trees, Apples, Pears, and Plums, which are grown to test the fruiting qualities of varieties that are not commonly known, and about fifty varieties of Strawberries are planted in beds between the fruit trees.

It may here be stated that Messrs. Osborn are making a speciality of Rose and fruit tree growing, for which the soil in this nursery is especially adapted. Proceeding through the different quarters of the nursery the large breadths devoted to the cultivation of fruit trees for orchard planting is significant as forecasting the coming demand for trees of this particular form which have been too long neglected and despised. Indeed, since the old-fashioned English orchard has disappeared the well stocked fruit-room of twenty years ago has disappeared also. Therefore, while it is satisfactory to see an abundant stock of pyramid and other dwarf forms of trained fruit trees, it is a good omen of the future to see a general move in the direction of preparing material for new orchards. But as I have said, there is no lack of variety; there are large quarters of Apples upon the free stock as well as upon the Paradise stock, the latter being suitable for small gardens.

Pears upon the Quince, Plums, Cherries, Peaches and Nectarines are here in abundance, either for walls or espaliers or for planting as bushes or pyramids in borders. Roses are grown in thousands as dwarfs and standards upon the Brier and Manetti stocks, and also upon their own roots. Large and promising plots of Roses in dormant bud clearly indicate that Messrs. Osborn have gone into this branch of their business in earnest. But although fruit trees and Roses are specially grown there is no lack of other general nursery stock, of which Hollies perhaps comprise the largest element. The plants, both large and small, have been regularly transplanted, as indeed their health and compact habit of growth abundantly testify. The varieties are *Ilex latifolia*, *Hodginsii*, *Lawsoniana variegata*, *maderensis*, *donningtonensis*, *crispata*, *lutescens*, *aureo-cincta*, *ferox-argentea*, *Handsworth Silver-striped*, *Golden Queen*, *Fisheri*, *Silver Queen*, and *argentea robusta*. And of miscellaneous stock may be men-

tioned purple and common Beech, scarlet Oaks, Elms, Walnuts, Acer colechicum rubrum (the scarlet-leaved Maple), Limes, Cedrus Deodara and atlantica, Pinus Benhamiana, Jeffrey, Abies orientalis, Douglasii, and breadths of Aucuba japonica and flowering shrubs in variety. Messrs. Osborn's new hot-houses are, however, the taking feature of the establishment at present. Occupying a central position in the nursery, and within full view of the Staines and Windsor Road, their style and finish is sufficient to attract notice from those who are interested in horticultural pursuits, particularly in the glass department. Messrs. James Boyd & Sons, of Paisley and London, are the builders. Messrs. Doyd's system of ventilating is so simple that a child may perform the operation without an effort. The houses, both old and new, are span-roofed, and run north and south, with passages between each structure and with boiler-house and potting-shed situated about the centre of the block. Commencing with the recently built houses upon the east side of the block are two pot Vine houses with centre and side pits, and liberally furnished with top and bottom heat. Each house is supported by three upright iron columns. The depth of the centre and side pits does not exceed 2 feet 6 inches, and the walls of the pits are pigeon-holed about half-way up, say to a depth of 15 inches, in order to secure a uniform top and bottom temperature. Perforated iron gratings with round holes enclose the bottom-heat pipes at 15 inches from the floor line or centre of each pit, and over these gratings the plunging material is placed, which may be used or not at discretion. I noticed particularly that instead of wooden wall plates the pits are finished off with blue Stafford bricks set in cement—a very good idea for the nurseryman but not so good for the carpenter or painter, whose services will never be required either to mend or paint.

The system by which a supply of water is secured is worthy of special notice. There is a tank in each house, all being connected underground, and filling and emptying themselves together. These tanks communicate with a large tank out-of-doors which receives the overflow, and in case of protracted dry weather the large tank can be filled at any time by a pumping apparatus contiguous to the houses, where there is a never failing source of water from a spring. I think this arrangement for a supply of water is almost unique. Running parallel with these are several other smaller structures, about 60 feet long and 14 feet wide, with paths under the apex of the roof, and well supplied with top and bottom heat. These houses are so arranged that they can be converted to propagating, grafting, or any other purpose, and are equally eligible as plant-stoves, intermediate-houses, or greenhouse. There is bottom-heat, which may or may not be used; plants may either be plunged in the beds or set upon their surface, and where propagating or grafting is to be done there are cases made to fit each bed in divisions, which gives propagator and plant-grower every chance of succeeding with their work.

One of the houses was being prepared for starting to graft Roses during the present month. In another of the houses there is a good display of Cyclamens, Poinsettias, and Gilbert's double Primulas; and in a third a fine show of winter flowering Pelargoniums; while a fourth is to be utilised for forcing Roses. Messrs. Osborn are also making extensive provision for raising large stocks of Lapagerias. At the west side of the block, next the manager's house, a large double span house has been very successfully removed from the Fulham nursery. I believe it was a vineyard at Fulham, but at Sunbury it is to be a Rose-house, except what little additions may be required from time to time to render it attractive. There are three stout columns under the centre of each span, and a like number supporting the middle beam, under which there is a stage for pot plants 3 feet in width. Stages of equal width are fixed round the sides, leaving the whole body of the house to be planted with Tea and other Roses.

There is a good deal of foresight required in fitting up a nursery establishment at the present day, and the arrangement of the glass department of this nursery furnishes a striking example of how to make the most of everything—even a brick wall may be made to answer more than one purpose. Here is an example. Outside the walls of the Rose-house two pits are constructed, at a trifling cost, in which large quantities of small plants in pots are stored away for the winter. Plants that are hardy

enough in ordinary winters require a little protection when the temperature falls below zero, and in these pits, observes Mr. Munro (Messrs. Osborn's manager), "we get sufficient heat through the brick wall from the hot-water pipes in the Rose-house to protect certain classes of plants through the hardest winter with safety."

There are the usual ranges of heated and unheated pits, filled with a variety of nursery stock coming forward—from the rootless cuttings to the more established stock, which will have fresh quarters at the turn of the year. The offices, packing-sheds, &c., lie to the east of the houses, and when the work now in progress is completed a more compact nursery system need not be wished for in point of practical utility and despatch. *W. Hindle.*

A FRUIT WITHIN A FRUIT.

A SHORT time since we figured a case where pericarp Grapes were issuing from the interior of a

FIG. 1.—A POD WITHIN A POD.

berry, the supplemental Grape occupying the position usually occupied by the seed. Professor Sereno Watson, of Boston, U.S., now kindly sends us an instance of a somewhat similar nature in a Californian Crucifer (Tropidocarpum), with a long translucent pod destitute of the partition or "replum" so commonly met with in the seed-pods of Crucifers. On holding up the pods to the light it is easy to see at the base of the fruit a small ovary occupying apparently the very extremity of the flower-stem within the normal seed-vessel. Our illustration (fig. 1) shows, at A, a normal pod magnified twice; at B a pod with one valve removed to show the ovules and the supplementary pod at the base, the line by the side indicates the natural size; at C is the supplementary pod removed and a cut across the same; at D is a similar supplementary pod from another fruit, showing two styles; at E are shown two partially ripe seeds. We have seen and figured in other Crucifers adventitious pods occupying the place usually filled by an ovule; M. Bailion also has noted a similar occurrence, but we do not remember to have seen one originating from the very base, as in this instance.

THE CULTIVATED RYE.—Secale cereale is said to have originated in Central Asia. According to Regel, S. cereale var. anatolicum is the wild form from which the cultivated plant has been developed.

NELUMBUM LUTEUM.

In the *Gardeners' Chronicle*, August 13, 1881, p. 214, allusion is made to this plant by Mr. W. T. Dyer and myself in reply to Mr. Nesbit's remarks and queries in the preceding number, p. 183. At that time I could not recall any allusion to its having bloomed in cultivation: I have just had an opportunity of looking over Maund's *The Botanist*, and there, at t. 14, find a beautiful coloured plate made from a "plant which flowered splendidly" in 1836 or 1837 in the stove of "Mr. Miller, of Durdham Down Nursery, near Bristol." It is very interesting to find that the plant has really bloomed under home cultivation, and the following particulars, from *The Botanist*, may be of some interest to lovers of aquatic plants. *F. W. Burbidge, College Gardens, Dublin.*

This most beautiful species of Water Lily is native of the lakes, rivers, and stagnant waters of North America, extending from New Jersey to East Florida, and inwards as far as Louisiana. It is believed to have been introduced into the ponds and lakes in Brobston Meadows, near Philadelphia, its natural limits not being supposed to reach so far north; though Michaux appears to have met with it in the district of Illinois. Walter mentions having met with a variety with white flowers. Some writers regard this as a variety only of the *Nelumbium speciosum*, the sacred or Egyptian Bezo of the ancients. In this opinion Barton concurs, both in his *Prodromus* and also in his *Compendium Florae Philadelphicae*, ii., p. 27. Whatever may be the accuracy or incorrectness of this opinion, all will agree with him when he states "There is not surely in North America any plant comparable to this for grandeur, simplicity, and beauty. Truly it may be styled the Queen of American Flowers."

It is the largest flower produced in North America, that of *Magnolia macrophylla* excepted. It seems conscious of the place assigned it, and its beautiful flower, being raised on a flexible stem 3 or 4 feet above the water, waves to and fro in the most majestic manner. It generally keeps near the edges of the rivers, but Bartram has seen it extend across Cape Fear River, in North Carolina, though 2 miles broad and 12 feet water, its leaves covering many acres and forming a delusive way plain.

Nor are they merely ornamental plants, for independently of their affording shelter to the fish, and often a resting-place to birds, their seeds are sweet and pleasant eating, and are favourites with the native Indians and boys. The flower, like that of the *Nymphaea alba* or White Water Lily of the lakes of Europe, closes at sunset, and opens on the following day, the object being to exclude the humidity that is deposited from the air, and which, if it had access to the pollen while yet in the anthers, would rupture it prematurely and prevent the fertilisation of the ovules, thereby hindering them from becoming perfect seeds. This regularity in the opening and closing of the flowers, dependent upon the intensity of light, caused Lionneux to place the Water Lily on his *Dial of Flowers*, and has been frequently remarked by the poets as the most noted example of those plants which "dedicate their beauty to the sun."

The mode of germination of *Nelumbium luteum* has been most beautifully represented and illustrated by Poiteau, in the *Annales du Muséum d'Histoire Naturelle*, vol. xiii., p. 395, t. 29, f. 42-46.

This species of *Nelumbium* appears to have been introduced into Britain in 1810. The drawing in Maund's *The Botanist*, vol. i., t. 14, was taken from the plant which flowered in the stove of Mr. Miller, as above stated. It requires to be kept in a very warm situation in the stove. Sweet, in his *Botanical Cultivator* states that, "It should be grown in a large pot, in a rich loamy soil, and requires a strong heat to flower in perfection. The pot or tub should be kept full of water all the time the plants are growing, but may be allowed to get dry when the flowering season is over. The plant may be increased by dividing at the root, but is obtained more readily from seeds, which vegetate freely." In order to sow the seeds successfully, it is necessary to surround them with a mass of clay before they are thrown into the water, that they may be kept at the bottom. Some cultivators of *Nelumbium* always carefully open the points of their seeds, and then keep them in water in the stove till they begin to vegetate. They are then planted in large pots, half-filled with strong loam, and filled up with water, the water being frequently changed with care, and the plants reported as their size may demand. [For an account of the flowering of this plant, see *Gardeners' Chronicle*, 1853, p. 292. It also flowered in the Botanic Garden, Oxford, in 1874. Ed.]

SOME FACTS ABOUT CONIFERS.

WHILST preparing a paper on some fossil Conifers I collected the following statements for my own information from various sources. Their publication may save trouble to others who are seeking such facts, and may possibly lead to information which has not come under my notice being added to this nucleus. I relied for the most part on Government, English, and colonial Blue-books, jury reports on exhibitions, books of travel and text-books. For facility of reference the facts are grouped under sub-headings. *J. Stabile Gardener.*

SIZE.

The height of the Douglas Spruce has been variously stated at from 150 to 200 feet, and exceptional trees are mentioned by Herschell and Humboldt of 215 feet, with a girth of 57½ feet, and by Emerson of 300 feet. A section now in the Kew Museum, exhibited in 1862, was from a tree 309 feet high and 185 feet to the first branch. The spruce in Kew Gardens, 150 feet high, is from this tree. *Picea Menziesii*, or the tide-land Spruce, is usually stated to reach a height of 100 feet, but a section shown in the Philadelphia Exhibition was cut from a tree 318 feet high, with a diameter of 16 feet at the butt.* The height of *Abies grandis*, the White Fir, is usually stated at about 200 feet, but the State of Oregon exhibited sections from a tree 321 feet high and 15½ feet diameter at the butt, 6 feet 10½ inches exclusive of bark at 130 feet, and 5 feet 10 inches at 200 feet from the ground.

The Sugar Pine—*Pinus Lambertiana*—is stated to reach 230 feet (Lindley and Emerson), 200 feet (Gordon), 235 feet (Herschell), yet we learn from Professor Newbury that it attains a height of 300 feet. The height of the Weymouth Pine is similarly stated by Gordon as 100 to 150 feet; by Emerson, 130 to 140 feet; the *Kew Guide* mentions 120 to 160 feet; while Dwight, in the report on the trees and shrubs of Massachusetts, records it at from 250 to 264 feet. The Oregon Red Cedar, *Thuja gigantea*, is said by Gordon and others to be from 50 to 150 feet in height, and by Herschell, 200; but a section from Oregon was exhibited at Philadelphia cut from the trunk 118 feet above the ground from a tree 325 feet high and 22 feet in diameter. A similar height seems attained by several other species of Western North America. The height of *Sequoia gigantea* (Wellingtonia) seems, on the other hand, to have been exaggerated. Herschell calls them "the loftiest and grandest of trees, said to attain the almost fabulous height of 300 or even 400 feet, with a diameter of nearly 50 feet near the ground."† The maximum height assigned to them by Hooker is about 325 feet, but the largest tree recorded is broken at 300 feet from the ground, and measured at the break 18 feet. Its stump tapered regularly, and the tree, now I believe blown down, was calculated to have been 450 feet high. *S. sempervirens* reaches 300 feet according to the *Treasury of Botany*, and 270 feet according to Hooker, with a girth of 55 feet at 6 feet from the ground. Most of these examples are probably abnormally large, but it appears to me to be of interest that the maximum heights observed should be brought together. Illustrations and descriptions of the Conifers of the Sierra Nevada have appeared recently in *Scribner's Magazine*, which gives life-like representations of the trees themselves with artistically-managed atmospheric effects in the rest of the scenery.

Although America, and especially the Sierra Nevada, furnishes the most gigantic coniferous trees to be found on the globe, yet the Conifers of many other regions rival them in size. In the Himalayas *Pinus excelsa* reaches 200 feet, and bears cones 1—2 feet long; the stately *Cedrus Deodora* 200 feet, and 36 feet in girth; *Picea Smithiana*, 170 feet; *Abies Pinifera*, 150 feet; and the gloomy *Cupressus torulosa*, 150 feet, and 16 feet in girth at 5 feet from the ground. In China and Japan the sizes are conspicuously less. *Scladopyx* reaches 100—150 feet; *Ginkgo*, 100 feet, and 40 feet in girth; *Cryptomeria*, 100 feet. In Europe the Coniferæ, although less colossal, still attain magnificent proportions by comparison with other forest trees. *Abies pectinata*, the common Silver Fir, is stated by Gordon to reach 150 feet, and by Selby, in the *British Forest Trees*, to surpass 180 feet. The extreme height, according

to Goepfert, reached in Europe by *Pinus Laricio* is 120 feet; by the Austrian Pine, 120 feet; and the Larch, 120 feet. The common Spruce, *Picea excelsa*, grows to 120—160 feet, and Selby instances a tree of the enormous altitude of 180 feet in Britain. The English Yew, although never lofty, has been measured 56 feet 6 inches in girth.‡

In the southern hemisphere many of the New Zealand Podocarps exceed 200 feet in height. The *Araucaria imbricata* of Chili reaches 260 feet; *A. Cookii*, 200; *A. excelsa*, of the Norfolk Island Pine, 224 feet; *A. Bidwilli* and *A. Cunninghami* reach 150 feet. In Tasmania *Dacrydium Franklinii*, or the Huon Pine, reaches 100 feet; *Phyllocladus asplaniifolia*, or the Celery Pine, 150 feet; *Dammara australis*, 150 feet, and the latter in New Zealand attains 200 feet.

Contrasted with these is *Dacrydium taxifolium*, the most diminutive Pine known, fruiting specimens being, according to Kirk, sometimes only 2 inches high, while the average height is only 6 to 10 inches.

AGE.

The ages attained by some of the Coniferæ are scarcely less extraordinary than their colossal bulk. The greatest longevity assigned to any tree is perhaps credited to the celebrated Taxodium of Chapattepec in Mexico, 117 feet in circumference, which is thought by De Candolle to exceed in age the Baobab of Senegal, inferred to be 5150 years old. Goepfert states that Taxodium distichum has been ascertained by its annular rings to live 2000 years. The Mammoth tree has been estimated to live 4000 years in California. De Candolle quotes a number of instances of longevity in the Yew, and Endlicher considers one in Derbyshire to be 2096 years old, and the one at Grasford,§ in North Wales, 1400 years old. The Pines, Cypress, Firs, Larches, and Cedars, are credited with ages of 200, 300, and even 500 years. *Picea*, 200 feet in height, is mentioned by Goepfert, as ascertained by its annular rings, to be 460 years old, and a Larix of 120 feet to be 576 years old. The Scotch Pine, *Pinus sylvestris*, is said to require 200 years to mature its timber to perfection. In Veitch's *Manual of the Coniferæ*, the ages of some of these are stated at considerably less. Other examples of a longevity greater than 500 years are mentioned, there are *Cedrus Deodara*, 750 to 900 years; *Cedrus of Lebanon*, 600 to 800 years. It is important, however, to recognise the fact that rings of growth are not in all cases trustworthy guides, and the subject is still involved in some obscurity. The rings of growth in *Eucalyptus* have been ascertained to be biennial. White Cedars planted in England show symptoms of decay, as in Richmond Park, as if their full age, in this climate at least, were already reached.

HARDINESS.

Among the Coniferæ are to be found perhaps the hardest trees on earth. In northern latitudes they cease almost only with vegetation, reaching 68° and 70° latitude, and in the southern hemisphere are found growing as far as the 55° and 50 latitude. *Picea rubra* presents the last vestige of arborescent vegetation in arctic America. Trees of *P. alba*, 20 feet in height, were found by Sir J. Richardson on the Coppermine River in latitude 67½°, within 20 miles of the Arctic Sea. *Pinus sylvestris* extends to 70° 30' in Scandinavia, and *Picea excelsa* to 69° in Sweden and 67° in Norway. *Abies pectinata* forms vast forests between 66° and 67°, and extends to 69° 30', although of diminished height. The Larch, which does not extend far north in Europe, reaches 58° in the Ural, 67° on the Ob, 68°—69° in the Jenesei, and to the ultimate limit of trees in Kamshacka, and was even traced by Middendorf in Siberia as a trailing shrub to latitude 72°. Similarly *Pinus Cembra* will not grow in Europe north of latitude 48°, but reaches 66° 30' at 70° E. longitude. In Central Asia we find the genera *Pinus*, *Picea*, *Abies*, and *Cedrus* passing an elevation of 10,000 feet, while *Juniperus* and *Cupressus* reach 15,000, and 10,000 feet respectively. In Mexico the altitudes attained are as great, *Pinus Montezumae* reaching to 12,936 feet, and *Ephedra* 15,000 feet in

* At Fortingal, at the entrance to Glen Lyon, Perthshire, by Pennant.

‡ Jury Reports on Woods of Von Diemen's Land, Exhibition, 1874, p. 149.

§ Diameter according to Endlicher, 50 feet, and Selby 20 feet. The discrepancy is difficult to recognise, except on the supposition of a misprint.

¶ Humboldt, *Treves of Nature*, p. 326.

Peru. Where the climate is too vigorous to permit their growth as trees, they push beyond their natural limits as low creeping bushes. The magnificent *Abies Douglasii* crosses the summit of the Rocky Mountains, but at the higher points is dwarfed to a small dense bush less than a yard high. *A. Patagoniana*, a tree 150 feet in height, dwindles to a shrub but 4 feet high on the summit of the Mount Baker range in North California. The stately *Pinus sylvestris* and *Abies ovata* become diminutive bushes in approaching their arctic limit. *Picea excelsa* flourishes from 4000 to 6500 feet, but dwarfs at 7000 feet. *Pinus aristata* forms a prostrate bush at 12,000 feet on the Colorado Mountains, and *P. peuce* similarly diminishes in Turkey. *Fitzroya*, a stately Cedar, 100 feet high, on the west slope of the Patagonian mountains, dwindles to a small bush a few inches high on the confines of perpetual snow, and the Chilean *Liocedrus*, 100 feet high, on the Cordilleras, dwarfs to a small bush in Magellan. Of all the Coniferæ, however, the Junipers are the most hardy, extending as low scrub bushes on most mountain chains to far beyond the limits of trees, and occupying Cape Horn towards the south (J. uvifera), and Labrador, Newfoundland, Hudson's Bay, and Greenland in the north (J. canadensis).

(To be continued.)

SUNBURY COURT.

If there are two months in all the year when there is a dearth of flowers those months are October and January. One is, therefore, not a little gratified to meet with a display of flowers such as Mr. Pratt has brought together at Sunbury Court, the seat of Lieutenant-Colonel Harfield, near Hampton, Middlesex, which reminds one more of June than January. Foremost on the list must be mentioned some fine plants of *Dendrobium nobile* which have done good service through the Christmas festivities, and a good stock of *Cypripedium insigne* and *Zygopetalum Mackayii*—three old-fashioned Orchids, which are most useful for cutting through the winter months. For brilliancy of effect, however, the display of winter flowering Pelargoniums carries off the palm! Mr. Pratt grows a household of them in 6-inch pots, and no doubt owing to the mild winter they are better than usual.

Those who have not the best means for plant-growing, and who do not employ the best skill, will find in the scarlet varieties of these Pelargoniums a good substitute for the Poinsetta, which is not at all a convenient flower to deal with in a cat state. The kinds that struck me most are Mrs. Whiston, Charles Smith, Leverston, Titania (a beautiful striped variety, one of Cannell's raising, I think), and Madame Ballet, the best double white in cultivation. The Strawberry-house is gay with *Primulas*, Veitch's strain—and a very good strain it is. By the way, the house is constructed in a novel way, and I am much struck with it in point of utility as a garden structure, especially for Strawberry forcing and for winter flowers. It is one of "Beard's patent," in three tiers, the bottom and centre tiers projecting proportionately from the top lights, under which there are two shelves hung at about 2 feet apart. The shelves under each of the bottom tiers are made large enough for a double row of plants, which are quite close to the glass, and each tier is ventilated separately, which is of some consequence in Strawberry forcing.

But this is not all. The pathway is made of wood, and its peculiar construction suggests that there is something going on beneath it. And so there is. And the something is a Mushroom bed. Lots of people complain of having no Mushroom-house, and therefore cannot grow Mushrooms, but here is one that costs only the price of the boards to cover it, which are no more expensive than a common spar path. The temperature of the house is kept at from 50° to 55°, just the heat to suit Mushrooms. The crop is an excellent one, and a handy workman will make up three beds of any given length in this fashion for one he will make in orthodox fashion in a Mushroom-house. The double *Primulas* in this house are especially noteworthy, and *Cyclamens* and other spring flowers are fast coming forward. Some of the *Primulas* are beautifully fringed.

The plant-stove is gay with fine heads of *Euphorbias*, *Poinsettias*, winter flowering *Begonias*, *Justicias*, and other well known winter-flowering plants. The *Euphorbias* are grown in 8-inch pots, and trained to

* *Report Phil. Internat. Exh. 1876*, vol. iii., p. 300.

† *Physical Geography*, p. 311.

a wire trellis upon the roof, where they are shown off to good effect. I noticed grand pots of *Eucharis amzonica* nearly 5 feet across, which bear from twenty-five to thirty flower-spikes, and make a fine show when in flower. Early Tea Roses and other plants are coming forward in forcing-pits, and the occupants of the several fruit-houses are looking both healthy and prosperous. The young Vines planted by Mr. Pratt during the past season have made remarkable progress, and seem to luxuriate under the improved conditions prepared for them. *Albion*.

COLONIAL NOTES.

COFFEE-LEAF DISEASE.—Mr. Marshall Ward has made his third and concluding report on the Coffee-leaf disease, which has caused so much mischief in Ceylon. The disease is caused solely by the *Hemileia*, a parasitic fungus originally described in these columns by Mr. Berkeley. The whole direct damage done by the fungus is loss of leaves, whence, of course, arise evils consequent on starvation and suffocation. The spores are carried by the wind, germinate in moist weather, and run their life cycle in about three weeks, to begin again their course of destruction. External applications, owing to the countless number of the spores and the impossibility of reaching them all, are useless, nor have the attempts made to combat the fungus while growing within the tissue of the leaf been of any service. Mr. Ward recommends the collection and destruction of diseased leaves, not by burning, but by burying them and covering them with caustic lime, sheltering the plantation from spore-laden winds, and cultural proceedings so contrived that there may be as little young foliage exposed during the time when the monsoons prevail, and the spores are most blown about.

THE FORESTS OF THE SUTLEJ VALLEY.—Dr. Brandis has published *Suggestions Regarding the Management of the Leased Forests of the Bushahr in the Sutlej Valley of the Punjab*. Deodar is at present the only tree that can be exported from these forests on a large scale, but Walnut and Boxwood are available, and the latter especially should be looked after in view of the scarcity and large demand for this wood. *Pinus excelsa* or Blue Pine, is also of some commercial importance, and there are forests of limited extent of *Pinus longifolia*. The concluding paragraph shows the spirit in which the British Government in India is conducted:—"The management of the Bushahr Forests by the British Government not only gives to his Highness the Raja a large annual income, but furnishes remunerative employment to the people, of whom every year large numbers come forward to seek such employment on the timber works, and on the works of improvement. The terms of the lease give great power to the British Government, and the officer entrusted with the management of these forests must always bear in mind that, though one object of the agreement may have been to secure a permanent and steadily increasing supply of Deodar timber to meet the requirements of the plains of the Punjab; yet the chief aim of forest administration in Bushahr must be to promote the permanent welfare of its people."

THE GROSVENOR GALLERY.

The chief attraction of the winter exhibition at this gallery is a large series of pictures, chiefly portraits, with some allegorical pictures, painted by G. F. Watts, R.A. As many artists and judges of pictures have long been inclined to give Mr. Watts the first position in this country as a portrait painter, such a large collection as this is cannot fail to prove most interesting and instructive. One of the first points that must strike every visitor is the strange inequality of execution of these pictures. Very few dates are given in the catalogue, but it is evident that whilst some of the pictures are quite recent many of the examples have been painted for many years. The west and east gallery contain nearly 200 pictures by Mr. Watts, whilst other portraits and allegorical subjects are hung elsewhere in the galleries. A great and widespread interest is taken in good portraiture, whether painted in oils, as in this exhibition, or etched, or engraved on steel or wood, or photographed. Every visitor to the Grosvenor Gallery will now have a good oppor-

tunity of forming his own estimate of Mr. Watts' powers, and visitors may be assured beforehand that it is not an exhibition of portraits of "nobodies," such as one too frequently sees elsewhere, but a collection of portraits of some of the most remarkable men and women of the present generation. No doubt most of the portraits are admirable and life-like in a high degree; if there is a single failure it is, possibly, 112, the full-face portrait of Alfred Tennyson. Two of the best portraits are undoubtedly 122, Sir Charles Wentworth Dilke, Bart., and 30, the late John Stuart Mill. Leslie Stephen, 123, is also excellent, as is 108, the Duke of Argyll. One of the most extraordinary portraits is that of Thomas Carlyle, 125; this is an unpleasant picture, and must surely represent Mr. Carlyle in an unusually rough and repulsive condition.

Some of the allegorical pictures and illustrations of mythological subjects are remarkable, but we do not think the painter is seen at his best in these compositions. No. 55, "The Wife of Pygmalion" is a magnificent example of excellent drawing and painting, founded on an antique model of noble classic beauty. It seems extraordinary that Mr. Watts should have attempted such an unpaintable subject as 92, "The Creation of Eve—one of a series of compositions treating of the Creation of Man." The collection of Mr. Watts' works includes numerous landscapes.

There are very few pictures this year of special horticultural or botanical interest, although there are numerous well executed landscapes in water-colours. In 248, "May Blossoms," by Mrs. E. Pfeiffer, we have an excellent little picture of Apple blossoms with a Cabbage butterfly, and a very beautiful picture of "Lilacs," 375, by the same artist. In 348, Mrs. W. Duffield exhibits a picture of a large spray of *Odonotoglossum Alexandrie* (printed in the catalogue "Alexandra"), but though an admirable water-colour drawing it fails to impress us as a first-class variety of the Orchid in question. One of the best landscapes is a bold and excellent picture named "The Youthful Thames," 277, by Alfred Parsons. Amongst other contributors are the Hon. Mrs. Boyle, Richard Doyle, W. J. Muckley, E. J. Poynter, &c.

FRUIT NOTES.

Winter Pearmain Apple.—I have had here for several years some robust growing Apple trees, which annually fruit, and fruit well, under the belief that it was the Holland Pippin. I got this name for it some time since, but now find that, on a careful comparison of the fruit with Dr. Hogg's description of that kind, it is no more like than the moon to a green cheese. Of course I ought to have hunted out the correct name long since, but took it for granted that the name given was the right one. Taking down the *Fruit Manual* to look for something else, I lighted upon the name and description of Winter Pearmain—or the Old Pearmain—and there I found the exact appearance of the fruit of my *sub-ident* Holland Pippin most accurately described. "The tree is hardy and a good bearer"—just so. Mine are robust growers, almost as much so as the Blenheim Pippin. The fruit is well portrayed as "large, conical, somewhat five-sided towards the crown; skin smooth and shining, greenish-yellow on the shaded side, covered with deep red, and red streaks next the sun; eye large and open, stalk short; flesh yellowish, firm, crisp, juicy and sugary, with a brisk and pleasant flavour. Good kitchen or dessert kind, and in season from December to April." Well, if that is not a first-rate character for an Apple I do not know what is. How many new Apples can merit one half so good? I should here like to add that my note respecting King of the Pippins Apple was sent before Mr. Culverwell's correction of King Pippin appeared. What seems pretty evident respecting the "King" is this, that whilst it is a first-rate Apple in the South, it does not succeed well in colder districts. A. D.

Good Apples.—I have King of the Pippins now, good in size, and quite rosy in colour, as your correspondent "A. D." describes them, but wanting the fine aroma so abundant in Cox's Orange Pippin. I have the same objection to another one of the six dessert Apples named by "A. D." as first-class, that is, Blenheim Pippin. I am doubtful whether it should be called a Pippin at

all, but by the more appropriate name, Blenheim Orange. I grant that this Apple has everything in its favour to recommend it, except the delicious aroma so plentiful in the Ribston Pippin, and I will add another—Adams' Pearmain. Blenheim Orange is a grand Apple for kitchen use; the cook never tires of them. I care very little about another one of the six named, that is, Court-pendu-pâté. It has one good point to recommend it—its lateness in coming into flower, thereby generally escaping the frost in the spring. I must add to the list of those I have recommended to your readers the Lemon Pippin, a really good dessert Apple, medium in size, ripening to a fine lemon colour, abundantly aromatic, and a great bearer. The habit of the tree is upright, and not unlike the King of the Pippins. Old trees of it are to be found here and there in farmers' gardens, where the fruits are very much prized for eating. *Wm. Culverwell, Thorpe Perrow, North Yorkshire*.

Pear Knight's Monarch.—I fully assent to what Mr. Rust says in favour of the above, that it is the King of winter Pears when attainable in its perfect form; but how many of your readers can give such a glowing account of it? I am anxious to hear from different quarters as to the behaviour of this Pear. Will Mr. Rust kindly say upon what stock his trees are grafted, and if he has not experienced that peculiarity mentioned by him (and which I have always found so characteristic of this variety), viz, that of dropping its fruits, not only early, but prematurely, in consequence of which it becomes withered and shrivelled instead of attaining to that standard of excellence to which your correspondent has called attention, and of which he may well be proud, as the number of Pears possessing such merits as this are greatly in the minority after the month of December. *E. Morgan, The Butts, Harrow-on-the-Hill*.

King of the Pippins.—Two such big guns as "A. D." and Mr. Scott both firing at Mr. Culverwell, are rather formidable odds. But I can fearlessly put myself on his side, having grown the King not far from Merriott, and also in Sussex as well as in the North. The Apple is at the head of the second class, but far inferior to the five "A. D." mentions (p. 851), and fully five more which he does not mention. Mr. Scott says most truly, it is good for culinary purposes, and also for cider-making, but to rank it with Cox's Orange Pippin as a dessert fruit is to make Medoc equal to Château Lafite. Syke House Russet, as usual, has been grand this year. *W. Carmichael, Newton Court, Bury St. Edmunds*.

PLANT PORTRAITS.

- ALBUCA WAKEFIELDI, *Gartenflora*, t. 1031.—*Bot. Mag.*, t. 6429.
- ALOCASIA JOHNSTONI, *Ill. Hort.*, t. 395.—An Aroid introduced by Mr. Bull and characterised by spotted prickly leaf-stalks, supporting bold hasta leaves, green with the veins picked out in pink. Probably a species of *Lasia*.
- CHOISYA TERNATA, *Belg. Hort.*, t. xvii., 1880.—An Orange-like shrub, with dark green, stalked, palmate leaves, and terminal clusters of white flowers, each rather more than an inch in diameter.
- CHYSIS BRACTEESCENS, Lindl., *Illust. Hort.*, t. 398.—A Mexican Orchid, with elongated furrowed pseudobulbs, oblong acute leaves, and lateral racemes of large white flowers, with a 3-lobed saddle-shaped yellow lip.
- DIPLADENIA AMABILIS, Backhouse, *Illust. Hort.*, t. 396.—A cross between *D. crassinode* and *D. splendens*. A stove climber with shortly-stalked ovate oblong acute leaves, and racemes of large funnel-shaped orange-crimson flowers.
- DROSERA CAPENSIS and *D. SPATULATA*, *Belg. Hort.*, t. 314.

- STATICE TATARICA, Linn., *Bot. Mag.*, t. 6537.—A hardy perennial, long known in gardens, with stalked, spatulate leaves, and branching panicles bearing very numerous, minute flowers, with red corolla. S.E. Europe to Siberia.

The Rosery.

PROPAGATING ROSES IN WINTER.—The propagating of Roses in the summer is a matter more or less understood by most people, but few are aware with what ease and certainty they may be increased in other ways during the winter, the most certain being that of grafting, which may be done in comfort under cover of any warm house or shed. As a first preliminary in setting about the work, stocks must be procured which may either consist of Manetti or Briers, the former being the best for light soils on account of making a greater number of fibrous roots. To have the stocks in advance of the scions, which is of much importance, they should be laid in by the heels, or buried up somewhere in moist soil, where they can get a little heat just to give them a start. As soon as they begin to move, which may be seen by the buds breaking, they will be quite ready for operating on. To prepare them for the grafts, the tops should be cut off to within about 3 inches of the base, and then a notch made about half-way down on one side of the stem, when, by running the knife down from the point to the cut part, all will be ready for inserting the scion. To have this fit, it is necessary to shave off the lower end in the same way that would be done to a quill in making a pen; but, in addition to that, the shoot or graft must be so trimmed that the back of it may also fit into the notch. The two—the stock and the scion—may then be placed together, so as to bring the bark in immediate contact, when by binding both tightly round with a piece of bast matting or Raffia-band they will be held securely in position till union is effected. To bring about this a brisk moist heat is requisite, the most congenial being that given off by sweet fermenting material, in which the pots containing the plants should be plunged, and the frame be kept close and dark for two or three weeks, after which time light and a little air will be necessary to strengthen the shoots. The principal point towards success in the grafting of Roses is to obtain medium-sized well-ripened wood for the scions, and to get it before being injured by frost, which damages the inner bark, when instead of this forming granulating matter, as it should and must for a union with the stock to take place, it turns black and perishes. If Briers are used for grafting the best way is to have only the large roots, which make excellent stocks, as do also those of the Manetti, and one advantage in roots for stocks is that the plants may be had very dwarf with the union below-ground. *J. S.*

ROSE LADY MARY FITZWILLIAM.—Mr. H. Bennett, of Shepperton, sends us a coloured plate of this fine hybrid Tea Rose, raised from old Devonians, crossed with the pollen of Victor Verdier. The flowers are large, full, open, the rose-pink petals reflexed at the edge.

MADAME FRANCOIS JAMAIN ROSE.—This is a charming little Rose for button-hole bouquets in winter, its special quality being that of possessing a higher perfume than most other Roses in winter. In form and habit it somewhat resembles the old monthly, but in colour it is a deep yellow or buff. It has two distinct shades of colour, the centre of each petal being a deep yellow, inclining to orange. In bud it is not so handsome as Madame Falcoet, but exceeds it in fragrance, which is a high recommendation for a Rose in winter. *H. H.*

GERMINATION OF WELWITSCHIA.

SOMEHOW or other I did not remark M. Naudin's description of the germination of the *Welwitschia mirabilis* in your No. 398, of August 13 last, p. 217, till now, when I came to look over some back numbers of the *Gardeners' Chronicle*. I may be allowed to observe that his description possibly does not apply to the *Welwitschia* but to some other plant. [It will be seen from a letter from M. Naudin that our correspondent's surmise is correct, Ed.] and which may be said to have the appearance when young of an Olive tree. The germination of the *Welwitschia* is so admirably dealt with in Mr. F. O. Bower's paper that I need but refer M. Naudin to his (Mr. B.'s) article, further observing that the plant of *Welwitschia*, as you will see by the

dried specimen (see fig. 3)—a little over twelve months (the age M. C. Naudin quotes), and raised in my garden—has no other than the two primary leaves, or cotyledons, and the two true leaves, and that these primary leaves or cotyledons drop off when the plant is older, and only the two true leaves remain, and no more. The young plants present in the "tigellum" two scaly growths, which, I suppose, are the rudiments of the inflorescence, though my oldest specimens have not yet developed them any further. It is very true that a young plant of mine having lost one of its true leaves, one of the scales on that side has prolonged itself nearly a quarter of an inch, possibly to substitute the want, but has not progressed further.

I send you a photograph of the only specimen I have of a Mossamedes plant, which I suspect is a Composite plant, judging from the seeds, though the descriptions I have come across are very deficient

FIG. 2.—GERMINATION OF WELWITSCHIA (NAUDIN).

and confusing. This plant is the one in my African collection nearest approaching M. Naudin's description (but not the same, as we learn from M. Naudin, Ed.), but their seeds are much larger than those of the *Welwitschia*; they have not the leafy surrounding, and are exalbuminous, and when the two outer involucres are removed they present the appearance of a flattened earthworm, such as found during the dry season in the parched earth, with a not very perceptible germ until the process of germination begins. The seeds require further investigation. Mr. Charles Naudin may now be able to say which of the two has the appearance of this plant, or what are the differences. A description of the seeds would be highly obliging.

My friend, Dr. Jacintho A. de Souza has brought out four splendid living *Welwitschias*, two of the larger ones, 5 inches across, actually flowered on the voyage; one has nine, and the other eight flowers, which would prove them to be dioecious; they are

now in my garden. I trust they may become, when thoroughly settled, fine plants indeed.

Since I wrote the above on December 7 I have had more leisure to examine all the *Welwitschias*, now that I have them from a young seedling to an adult plant, and can now describe the growth of the two scaly growths in the centre. As seen in a very young plant they are two separate scaly bodies; these, as they advance in age, go on spreading and take the appearance of two mamillae, very similar to the remains of the flower of a ripe Pine-apple. These grow on, and filling the tigellum, oblige it to take a rather oblong form. When about five years old they are quite close together (as in the rough drawing fig. 3A), but are to all appearances separate. With an increase of age they coalesce completely (3B), and the jointure is imperceptible, though retaining the appearance of two mamillae, but when older they are so distended and rough that all traces of them are lost, and only a flat table-like surface remains, as seen in the dried specimens. The inflorescence springs from the two sides of these mamillae even before they have lost the trace of their origin, as a smaller specimen of mine (now received) shows them just sprouting in the form of three scaly heads rising from the margin on each of the longer sides of the mamillae (3C). These embryonic inflorescences spring from a round cavity, and the larger example that flowered during the voyage shows it better, and brings to my mind the germination of the Date Palm (*Phoenix*), which pushes from the margins in the albumen. I can go no farther with regard to the inflorescence, as those grown on the voyage had been broken off at the Custom-house. I send a sketch of a section I made of a sickly plant (fig. 3D), and you will see by it that the mamillae are separate from the leaves and outer ring, the leaves rising from below and between the outer rings and mamillae, or central table, whose (the leaves) proper vessels are visible through the vascular mass of the stem. The stem is full of a resinous sap, which gives a whitish to the knife, and freely exudes from any wound. I may further remark that besides the one I noted in my former letter I found another young plant with its leaves all perfect, having elongated a scale into a sort of leaf, but it appears to rise between the mamillae, and not to belong to them; both one and the other are narrow and bright green in colour. The following facts are now proved to be:—

That there is but one pair of true leaves.

That the two scaly growths form by coalescence the central table of the adult plant.

That from the margins rises the inflorescence.

That the inflorescence has a special cavity, from the centre of which rises a stalk supporting the flowering parts.

That the plants are dioecious.

That the sap and exudation are resinous.

That there are no concentric rings, the whole of the stem consisting of tough fibres.

That these plants appear to be endogenous and not exogenous in their growth.

These facts, and the form of their eight or nine flowers and fruits, and their mode of germination, taken all together, place these plants quite apart from all others, and constitute a special section, though a correspondence may be found for each of the several processes in other plants of quite different affinities, as explained in my paper on germinations. I place them among my section of Cryptorhizals, because they are neither true Endorhizals nor true Exorhizals, and if we were to class plants by their germinations there are many wrongly classed as plants of the same natural order do not begin their lives all after the same fashion. *Cher. D. G. de Naudin, Montevideo, Almeida, Fortuaga.*

I find that by an accident the seedling which I took to be that of the *Welwitschia*, having sown the seed as such, and which I described in your columns, 1881, vol. xvi., p. 217, is really not a *Welwitschia* at all. All my young *Welwitschias* (true) died, but I send you the drawing and notes relating to one of them, which now forms part of my herbarium, as a memento of an unsuccessful experiment. In 22 the references are as follows:—(A) *a*, cotyledons; *B*, primordial leaves very like the cotyledons, and, like them, glaucous; *c*, the seed with all its coverings; *d*, radicle, long, slender, simple, descending vertically. (B) In this specimen the letters have the same signification, except *c*, which shows the remains of the seed deprived of its outer covering, and showing a lateral process at the junction of the root and the tigellum. This is exactly what may be seen in the germination of *Euphorbia*, from which the young *Welwitschias* only differ in having narrower cotyledons. The transverse section of the tigellum between the cotyledons and the origin of the radicle shows four vascular bundles, which pass into the cotyledons; in which each of the bundles divides into three branches, that is to say, six for each cotyledon. In the radicle the transverse section shows eight vascular bundles arranged in a ring around the central pith. These bundles are made up of elongated cells and scleriform vessels. I omit many other details not necessary to be given in this place. *Ch. Naudin, Villa Thuret, Antibes.*

Notices of Books.

Frecks and Marvels of Plant Life; or, Curiosities of Vegetation. By M. C. Cooke, LL.D. (Society for Promoting Christian Knowledge.)

The staple of this book consists of a series of particularly written chapters relating to several of the most remarkable physiological phenomena in plants to which attention has of late years been so prominently directed in consequence of the researches of Mr. Darwin. Carnivorous plants, pitcher-plants, twining plants, sensitive plants, all pass under review, as well as the phenomena of movement, temperature, and luminosity.

There is no connecting link between these varied subjects, nor any method in their collocation. Each is treated separately, and without reference to any inferences that may be drawn from it. Even in the intro-

wise as one who should learn the letters of the alphabet or the words in a spelling-book without utilising the means thus acquired. In the old systems of arbitrary classification plants were thrown together much as plates on a shelf according to size or convenience, but once the principles of the natural system were understood, the dry bones of botany were made to live, and the story of that life has been rendered more interesting by the recent researches into plant physiology. Instead of a collection of lay figures, the botanist now has before him for his study creatures in many respects as wonderfully endowed as himself—replete with life, the living representatives of others which have gone before, and who had their history as the living ones are now making theirs. The life of a plant is in essentials the same as that of a man, and it partakes of engenders, in its degree, the same kind of interest which attaches to the study of man's organisation. Moreover, the study is infinitely easier, because not

animals, but where sentiment is allowed exclusive sway, reason and logic are disregarded. A perusal of Dr. Cooke's work—written, of course, without the smallest conscious reference to this matter—will, among its other useful purposes, serve to enlighten the understanding and enhance the intelligent apprehension of those well-meaning persons who are endeavouring to withstand the progress of knowledge, and to forbid what on the highest grounds of all, as well as on the lower ground of direct practical utility to animals and mankind, they ought to encourage rather than obstruct. By extending a knowledge of the physiology of plants the author of necessity promotes that of animals and of man, and leads people who otherwise would remain in ignorance of many of the mysteries and wonders of their own everyday life at least to feel some interest in the matter, and it may be to use better and more conscientiously those endowments, physical and mental, with which they have been created, and for

FIG. 3.—GERMINATION OF WELWITSCHIA (MONTEIRO). (SEE P. 14.)

duction we do not find any trace of the thread by which all these may be bound together; indeed, the introduction itself is but a *catalogue raisonné* of facts of like order to those described more at length in the body of the book. Viewing the book thus as a collection of isolated chapters we can but congratulate Dr. Cooke on having produced an agreeable and accurate work, one which should do service in awakening and stimulating a taste for botanical study. The mere collecting of wild flowers, and the counting of stamens and pistils or other superficial observation of plants may indeed furnish pleasant occupation, but they do not arrest the attention and stimulate the curiosity of the observer with the same intensity as do experiments or observations on the life-history, the manners and customs, so to speak, of plants. Too many, even now-a-days, look on botany as a string of hard words, the only object of which is to enable those familiar with the uncouth tongue to ascertain the name of any particular plant. Hard words and names are, however, only means to an end. To go no further than their tether is to act in such-

so complicated by the working of those higher characteristics of the mind and the will which distinguish the animal—at least the animal of high degree—from the plant.

To understand the machinery of the human body and its mode of action, it is therefore necessary to begin at the beginning, and to study in plants those structures and those modes of working which, as a rule, are so much simpler and so much more readily studied in plants than in animals. The most fanatical anti-vivisectionist will not object to experiments on a *Drosera*, and his moral consciousness will receive no shock on being told that the process of digestion in that little leaf is essentially the same as in his own stomach. He cannot but feel some interest in what goes on in the latter organ, even if he shrink from ascertaining what goes on in his own brain; while if he object to gain more direct information, he can at least avail himself of the more indirect knowledge afforded by the so-called carnivorous plants. Of course, logically, he has no more right to experiment with living plants than he has with living

the proper use of which they are responsible. From this point of view there is a peculiar appropriateness in the issue of this work under the direction of the committee of general literature and education appointed by the Society for Promoting Christian Knowledge. Had it been more systematically or didactically treated, it would have failed to secure the attention of the class for which it was designed; and even its title, though unwarrantable from a scientific point of view; may serve as a bait to attract those "non-scientific persons" alluded to by the author, who are terrified by the "outside" even of a scientific book. We commend Dr. Cooke's latest volume to the notice of parents desiring to give their children an interest in the physiology of plants, and should advise those who have the management of school and garden libraries to secure it for their bookshelves.

ROYAL GARDENS, KEW.—We are informed that no fewer than 836,676 persons visited the gardens during 1881—the largest number yet recorded.

Orchid Notes and Gleanings.

TRANSFORMATION OF FLOWER-BUDS TO AXILLARY LEAF-SHOOTS IN CERTAIN SPECIES OF ORCHIDS.—In my *Orchidophile*, p. 509, is recorded an observation that I made on *Vandates*, the flower-buds of which become converted into leaf-stems if by any means in the young state a superabundant supply of sap was diverted into the young buds. The same phenomenon was observed the following year in certain species of *Dendrobium* with deciduous leaves which M. Godefroy had sent me during the month of September. Wishing to get them established before the occurrence of frost I placed them in compartment No. 1 of my Orchid-house (East India-house), submitting them to a damp and warm treatment. The new roots were not long in making their appearance and my plants towards the end of December—which month had been very bright and warm—were in a thriving condition. In the month of January the cold became all at once very intense, hence I thought it prudent to deprive them of moisture and adopted a dry treatment such as they should have had when I first received them if the plant, had then been in condition to bear it. The result was that towards the end of February the buds which ought to have pushed in December showed themselves on *D. nobile*, *D. Freemanii*, *D. fimbriatum*, *D. Findleyanum*, *D. calceolus*, &c., in their accustomed positions along the old stems. The sun and heat having returned in March many plants in the compartment burst into activity, and this I promoted by giving a moist atmosphere necessary at that period. A very few days after I remarked a change of appearance in the nascent buds of these *Dendrobiums*, especially with those at the summit; the globular buds became elongated and pointed, as well as the outer scales. Finally, in April—May all the buds of *D. nobile* were converted into stems with buds, the others had only two or three of the uppermost buds changed, while the lower buds, not having changed, were in flower. This phenomenon confirms what I said of *Vanda teres*. A superabundant supply of sap took place at an unusual time, and the change was great in proportion to the amount of the nutriment supplied. In some cases the uppermost buds, being developed first, had in their growth availed themselves of all the superabundant sap; while in *D. nobile* it is the lower buds which are developed first, and as the sap is always directed towards the apex the other buds are developed in succession. Although this production of buds be a sign of bad culture, it may be employed with advantage to propagate these Orchids—especially as it does not prevent the formation of shoots from the base, and only affects the flowering. I infer that in a large number of species of Orchids that grow continuously, the difficulty experienced in getting them to flower depends on their being kept in too active a state, which prevents the formation of flower-buds by directing the sap towards the apex or into the latent vegetative buds. *Comte du Boysson*, in "*Orchidophile*."

ORCHIDS FROM SEED.—While admiring the beautiful Orchids raised by crossing distinct species, and fully appreciating their great value, the thought has occurred to me whether it is always the most profitable method of procedure thus to go on always crossing distinct species to obtain new varieties, which may be quite as good as the parents, though that is not always the case, although they are distinct from them. It is well known that there are very scarce Orchids; sometimes perhaps there are but one or two in the country, and these in some cases command a high price. Take, for instance, *Cypripedium Spicerianum*. A good plant of it may be worth 100 guineas, and unless it can be introduced from its native habitat it will always be dear; but being a distinct species it would doubtless reproduce itself from seed, and as *Cypripedium*, unlike *Cattleyas* or some other species of Orchids, flower in three or four years after the plants are up, it would surely pay to raise plants from seed as well, and prove better than raising to division merely. It is many years since *Cypripedium Stonei platycentum* was exhibited by Mr. Day, quite long enough to have strong flowering plants of it from seed; and yet I suppose the idea of reproducing the plant from seed never occurred to Mr. Day, while plants of it propagated by division, not of large size either, were sold at prices over 100 guineas—indeed, I question if a plant of it could be purchased under 100 guineas anywhere at the present moment. Amongst many importations of *Cattleya Warneri* again, one is found that

flowers in the late autumn months (*C. labiata*), while decent plants of it will always bring high prices and good ones 50 guineas each, owing to its slow increase by division. Would it not pay to raise seedlings of it crossed by its own pollen, and thus perpetuate the species or the variety? *J. Douglas*.

ORCHIDS AT GLASNEVIN.—There were fifty-six distinct species and varieties of Orchids in flower at Glasnevin on January 1, of which the following is a list:—

- | | |
|--------------------------------|--------------------------------|
| <i>Acerides giganteum</i> | <i>Dendrobium inervum</i> |
| <i>Anacochilus Dawsonianus</i> | " <i>nobile</i> |
| <i>Angulocymbium</i> | " <i>umbellatum fimbriatum</i> |
| <i>Bulbophyllum autumnale</i> | <i>Lidia autumnalis</i> |
| <i>Calanthe mastuca</i> | <i>Lycaste macropphylla</i> |
| " <i>Vetehina</i> | " <i>Skinneri</i> |
| " <i>venusta lineata</i> | <i>Mischobolus lineata</i> |
| " <i>rosea</i> | " <i>melanopus</i> |
| <i>Calya macrostachya</i> | " <i>ochrolepis</i> |
| <i>Colobrys asiatica</i> | " <i>polystachya</i> |
| " <i>guldiniana elegans</i> | " <i>bovatenis</i> |
| " <i>Masterei</i> | " <i>Vetehiana</i> |
| " <i>podanthum</i> | <i>Mastobolus picta</i> |
| " <i>senecae</i> | " <i>punctata</i> |
| <i>Cypripedium Argus</i> | <i>Mesospidium vulcanicum</i> |
| " <i>horridum superbum</i> | <i>Neesia picta</i> |
| " <i>Jovis</i> | <i>Odontoglossum Lisleayi</i> |
| " <i>Bullianum</i> | " <i>leopardinum</i> |
| " <i>Dominum</i> | " <i>pallidulum</i> |
| " <i>Hibernicum</i> | <i>Oidium renchobolium</i> |
| " <i>insigne</i> | " <i>unguiculatum</i> |
| " <i>Maadii</i> | <i>Restrepes</i> , species |
| " <i>platanum</i> | <i>Sophronitis violacea</i> |
| " <i>longifolium</i> | <i>Trichopoda fragrans</i> |
| " <i>venustum</i> | <i>Vanda furva</i> |
| " <i>podanthum</i> | " <i>lanellata Boxallii</i> |
| <i>Dendrobium altatum</i> | " <i>tricolor</i> |
| " <i>anceps</i> | <i>Warrea bidentata</i> |

Of these same plants thirty were in flower on December 1, and no less than fourteen have been flowering continuously since November 1. *Vanda lanellata Boxallii* is not only one of the most beautiful of recent introductions, but also one of the longest bloomers, as it has been almost three months in flower. Six are flowering for the first time at Glasnevin.

PISCATOREA LEHMANNI.—We note in your last issue that Mr. Makoy has this Orchid in flower, and that "Kr." describes the flower as striped white and pink. We send you a flower from our plant, and do not think that the colour can be called pink, although we confess that the English language is very rich in colour terms, especially as regards red and its different shades. We may perhaps have made a mistake, therefore we make you the judges of it, and if the colour of our flower is really violet, or purple, as we call it, then it will prove that there are two varieties, Mr. Makoy's and our own. As we do not know how Dr. Keichenbach has described this flower, we should like to know through your paper. [*See Gard. Chron.* Oct. 4, 1879, p. 424.] *E. Veruel & Co.* [The flower sent has obovate or spatulate segments, clear violet, as described by Professor Keichenbach, with white stripes and a curious lip strongly ribbed at the base, the terminal lobe covered with whitish setæ and with reflexed margins. We shall shortly give a figure of this beautiful novelty. ED.]

ODONTOGLOSSUM MIRANDUM.—Of the yellow ground *Odontoglossum O. mirandum* is a really fine species, which is the most valued because of its extreme rarity. A plant I saw recently bore a well developed spike, with eleven flowers. The sepals and petals are yellow, very distinctly marked with reddish-brown, the flowers being distinguished from all others of this class by a broad yellow margin to each sepal and petal. *J. D.*

Foreign Correspondence.

ANTHES.—My *Cucurbitaceæ* did not thrive well last year, for we had eighty days of torrid heat without a drop of rain; nevertheless I shall be pleased to receive seeds of new or rare species. Amongst others I have had the rare and extraordinary *Acanthoscyos horridus* from Mossamedes, but unfortunately I lost the plants in their infancy. I have had better luck with *Eucalypts*, of which I have now in cultivation a hundred species of all sizes and ages.

Carya cythrocarpa, &c.—The seeds you sent me (from Mr. Van Volken) succeeded well. I raised the male and female plants of *C. cythrocarpa*, both of which flowered; and it is worth noting that the male plant, though the ovary was abortive, yet produced two fruits, which, on account of the coldness of the nights, did not attain their full size. The female, after being artificially fertilised, produced several fruits, which were also checked by cold. The plants are, however, handsome shrubs about a meter in height. The hybrid between *C. cythrocarpa* and *C. cundinamaricensis* is a very fine thing, which I am keeping under glass for the present, with the view of planting it in the open ground in the spring. *Charles Naudin*.

The Kitchen Garden.

CROPS OF Broccoli, Cabbage (the latter too forward by two months), Kales, Spinach, and Parsley are still very luxuriant notwithstanding 12° of frost on the night of the 23d ult., and 8° respectively on the two preceding nights, and Cauliflowers are still being cut—not a very common occurrence the first week in January. If the present mild weather continues it will be advisable to make a planting of Cabbage from the nursery-beds next week in a warm situation, which will supplement the supply from the autumn-planted ones (from the same sowing), some of which are now turning in, at the same time advantage should be taken of the unusually mild nature of the weather to make a small planting of Cauliflowers in a favourable aspect, in drills 3 inches deep and about 24 inches asunder. Plants turned out of 3-inch pots, inasmuch as they will experience little, if any, check in being transplanted, will be the most suitable for early plantings. The Cabbage plants should be planted in the same way as the Cauliflowers, but need not be so far apart as the latter, and should be provided with a few bundles of Spruce boughs with which to protect the plants in the event of frosts or cutting winds ensuing, as a little timely forethought and judicious management in this direction invariably lead to good results.

AREARS OF WORK.—See that all areas of such work as the wheeling of manure on to vacant pieces of ground and the trenching or digging of the same are proceeded with as opportunity occurs, and do not postpone until a later and busier time work that and other circumstances will with ultimate advantage admit of being done now.

FORCING DEPARTMENT.—Put in another batch of Asparagus, Rhubarb, and Sealake roots in the manner described in the Calendar for October 29, p. 562, vol. xvi., and when the mould becomes a little dry on the surface water with tepid water in order to maintain the roots in a moist condition, otherwise the produce will be wanting in flavour and crispness. Make fresh sowings of Mustard and Cress at intervals of a fortnight or three weeks. French Beans are best sown in the pots in which they are to pod at once, in order to prevent the plants receiving any check subsequently in the transferring of them out of the smaller pots into the larger ones, of which the 8-inch is the most suitable size. However, in the event of being rather limited in this size—which is sometimes the case—it will be necessary to raise the number of plants requisite for a "batch," and as soon as the most advanced lot of plants have done bearing throw them out, wash the pots, and transplant the young plants into them. See that pits and frames in which Potatoes, Carrots, and Radishes are growing, have sufficient air to prevent them from making a weakly growth if they are inclined in the latter direction it will be advisable to draw the sashes off for a few hours on fine days, and leave a little air on to the frames at night. Shift young Tomato plants into suitable-sized pots, and put them back in heat near the glass, and stick each plant. *H. W. Ward, Longford Castle, Wilt.*

MUSHROOMS WITHOUT HEAT.—So many cases of failure occur in modern Mushroom-houses, that one is tempted to ask whether more fine Mushrooms are not gathered without heat than with it. On a recent visit to the Royal gardens, at Hampton Court, I saw a grand show of Mushrooms in beds made upon the ground-floor with only walking room between the beds. The building in which the Mushrooms are grown is simply an ordinary shed built against a north wall. There is, however, a kind of second roof to the shed in the inside, leaving a space of about 18 inches, which is filled with straw. It is well-known that straw is a non-conductor of heat, it regulates the temperature, which if low is equalled at this season, and in summer Mr. Laytham is very successful as well. Gatherings are made from the same beds for five to seven months, without being renewed, and at the present time there are such crops of Mushrooms as are seldom equalled in fancy heated houses. The quality and flavour is also much better than is obtainable from heated houses. No one will of course find fault with modern houses, but the hint as to temperature may be useful. In a second Mushroom-house of more substantial construction the

crops are equally good but no better. The house is from 50 feet to 60 feet long and about 12 feet wide. The beds in this house are also made upon the floor, 5 feet wide each, with walking space between; and although from 15 to 20 lb. of Mushrooms had been gathered that morning the surface of the beds was nearly white with young Mushrooms. Mushroom growing must up under Mr. Laytham's simple mode of cultivation. *Visitor.*

SEAKALE IN MARCH.—The old plan of covering Seakale in the open ground is not practised nearly so much as it used to be before forcing it in Mushroom-houses came into vogue, and yet the quality of produce gathered from the open ground in March is as much superior to that forced in Mushroom-houses as the best English hot-house Grapes are to imported ones. If the crowns are covered at once with any short light open material, the finest of Seakale will be ready for use early in March with little or no labour, except to keep the covering material sufficiently deep to have the crowns thoroughly blanched. *Cultivator.*

WINTER CULTIVATION OF RHUBARB.—This is perhaps one of the best paying crops a market gardener can grow, and at this season of the year he lays the foundation of a good supply by heavily manuring and digging the ground between the roots. Advantage is taken of frosty weather to get the manure, which has been lying in a heap for some little time, drawn on to the ground, and this can be done by means of a horse and cart without doing material injury to the crowns. The manure is spread thickly between the rows of Rhubarb, covering the whole of the ground, and it is then deeply dug into it, and the surface left a little rough. By-and-bye, when the crowns show signs of swelling with growth, a good coating of long stable manure is spread over the surface of the ground, and especially over the crowns which screen the young growth from frost and the influence of frosty winds; and as the leaves grow the covering is lifted with them, and still forms a screen until such times as it falls aside. The covering thus applied forms an excellent mulching in the case of a spell of dry weather in early spring until such time as the leaves grow sufficiently to shade the surface-soil.

CAULIFLOWERS.—To have a supply of these when they are most appreciated, and of the greatest value, no time should be lost in sowing seed in heat of Veitch's Early Forcing and Autumn Giant; to be pricked off in boxes when large enough, and be duly hardened off and planted out in favourable weather—the latter variety to come into use in August, and the first-named towards the end of May or beginning of June. If it is desired to have them a little earlier a few may be grown in 4 or 6-inch pots; to be liberally supplied with liquid manure when the pots are full of roots. With such a valuable sort in existence as the Early Forcing, autumn sowing and wintering in frames for an early supply is no longer a necessity. We ourselves have quite given up the practice, and have come to regard it as a good old-fashioned plan of our grandfathers which may now be said to be obsolete. *H. J. H.*

NOTES ON VEGETABLES.

SUTTON'S GOLDEN GLOBE SAVOY.—In large establishments it is not often that a Cabbage of any kind is made use of in the dining room (at least such has been my experience), but I think where this has once found its way there it will be asked for again and again. The variety is very distinct, so much so that it takes the eye of almost every one, having the appearance of anything bleached. It is rather tall-growing, of medium size, and very hardy, having stood all the hard weather of last winter without damage. The flavour is that of a good Brussels Sprout. *J. Corbitt, Fawley Court.*

CABBAGE-BROCCOLI.—Through the kindness of Mr. Gilbert, of Burchley, in sending me a pinch of his Cabbage-Broccoli seed in the early part of last summer, I have been able to grow this excellent winter vegetable here this year for the first time—a circumstance which enables me to speak more decidedly of it than I was before in a position to do. And as I like, in growing new varieties for the first time, to grow them in a small way—by way of testing their merits and in some cases preventing loss and disappointment—I only planted a few rows, from

which we have during the last few weeks been cutting nice white Cauliflower-flavoured heads, which all who have partaken of them here agree in pronouncing as delicious. While the form and constitution of this "Burchley Novelty" are those of the Cabbage, the character of the outer leaves, flavour and crispness of the heads, resemble strongly those of the Broccoli, but is quite distinct from any of the varieties of the respective kinds after which it is named; and I consider it a decided acquisition to our winter vegetables. I shall—in the event of my being able to procure the seed with which to raise the plants—make a larger planting of it next July, and I would strongly advise my brother gardeners to do the same. *H. W. Ward, Longford Castle Gardens.*

Grapes and Vineries.

GOLDEN QUEEN GRAPE, &c.—What mimics we gardeners are! Such and such a great gun says that we only need two varieties of Vines—Muscat of Alexandria and Black Hamburg—when, lo! and behold! everybody else thinks it is the proper thing to follow suit. I have often been applied to to confirm this verdict, but have just as often replied, "It is simply a personal matter; if you think so, why not have the courage of your convictions, and grow no other." Ah, there's the rub!—how many are there that do? Well, excellent as those two popular kinds are, they have not a monopoly of excellence—to wit, Muscat Hamburg, Madresfield Court, Mrs. Pince's Black Muscat, Mrs. Pearson, the little grown but finest flavoured of all, Chasselas Musque, the highly-flavoured White Frontignan; and, lastly, the much-maligned Golden Queen, which, strange as it may appear to some recent critics, a connoisseur in fruit told me last Friday that he infinitely preferred in flavour to that of the Muscat of Alexandria; and he added, "I can eat with greater relish a larger quantity of Golden Queen than of the Muscat, the spicy aroma of which cloy on the palate." This testimony, I think, confirms what I said, viz., that the question of variety of Grapes is a personal matter. I have the honour to serve an employer who requires Grapes, and has them, every day the year round, and I therefore dare to be singular, according to some, and grow several varieties, and further dare to announce that I grow largely those so-called coarse varieties, Alicante and Lady Downe's, and that their quality is appreciated. I have generally during February and March all too abundant evidence by the daily clearance of the dishes. *H. J. H.*

THE CHATSWORTH GRAPE.—Referring to the note on this Grape at p. 852 of your last volume, seeing that the writer at first sight thought it was Black Alicante, Mr. Horsfield must have it in better condition than it has been on either of the two occasions on which it has been before the Fruit Committee of the Royal Horticultural Society. As shown on both these occasions it was fine in both bunch and berry, but in colour a dingy red; the bunches were handsome—what I should term perfect in shape, being tapering and having moderate-sized shoulders, and bore abundant evidence of the robust character of the Vine, and if it can be coloured at all like Alicante there is no doubt but that it would soon become popular. Perhaps Mr. Horsfield may be able to send up a bunch to the next meeting of the Committee at South Kensington. *H. J. H.*

Peaches and Nectarines.

WITH a continuation of exceptionally mild weather Peach trees in early houses have come on very fast indeed during the past fortnight. We had a few blooms expanding on Christmas day, and now some of the trees are nearly in full bloom. Discontinue syringing as they come into bloom and keep the atmosphere somewhat drier, only damping the pathways and borders as they become dry. Fertilise the blooms daily with a camel-hair brush, or hare's tail. I prefer the latter, as the pollen hangs to them better than to the pencil, and is the means of carrying pollen from free-setting varieties to blooms of shy setters. Keep the temperature a little higher in mild weather—say 50° to 55° by night, with a corresponding rise by day. If Strawberry or other plants subject to greenly have been introduced, a sharp look-out must be kept, and if any appear they must be settled with at once by fumigating if the trees are not in bloom; if in bloom they are had to deal with until the fruit is set, when they may be syringed with a weak solution

of Gishurst Compound, or other insecticide. Pull off blooms on the underside of the shoots where the blooms are plentiful enough to allow of doing so, but where they are thin they may be left, as pale coloured fruit on the underside of the trellis are better than none at all. Proceed with pruning and cleaning succession-houses according to directions given in former Calendars, for owing to the mild season they are very forward, and the sooner they are done the better. *J. Wallis, Keele Gardens.*

PEACH GEORGE THE FOURTH.—This comparatively old and somewhat scarce variety is well growing, and ought to find a place in all collections. Of the many varieties our American cousins have from time to time sent us over, this, which I believe was one of their first, is, so far as my experience goes, one of the best. The fruit may be briefly described as large, nearly globular, footstalk set in a deep cavity; skin, slightly downy, dark crimson next the sun, creamy yellow and profusely spotted with crimson on the shady side; flesh, pale yellow, highly coloured at the stone, rich, melting, and juicy; flowers, small. It is also a free bearer, has a hardy constitution, and is a strong grower. *J. Horsfield.*

Plants and their Culture.

PLANT HOUSES.—Another year having now run its course it is just as well to reflect upon its failures and its successes in the various methods of plant cultivation, as in other departments of horticulture generally. The earlier part of the year just ended was characterised, as most of us know from experience, by unusual severity of the weather, causing an additional pressure to be put upon all hot-water apparatus. This is in all cases prejudicial to the health of plants, frequently causing rapid inroads to be made by insects in many forms. In contrast to all this the end of the last year was as mild as most of us can recollect, besides being favoured with a greater amount of sunshine during the month of November especially. As cultivators of plants we can but congratulate ourselves upon the favourable conditions we have to chronicle at the beginning of another year. Young cultivators should not be lulled into a sense of false security by the mild time of late, and be tempted thereby to increase the temperature in all departments devoted to plant cultivation too early. We may yet have severe weather, and where high temperatures have been kept up failure will have to be recorded against them. In the cooler houses, only kept at a safe degree above freezing-point during frost, abundant ventilation should be given, and if signs of excessive moisture are apparent a little heat should be applied on favourable occasions to dispel the same. Reverting to the remarks at the commencement of this Calendar, each of us will have added somewhat to our experience during another year, those of an observant turn of mind and attentive readers of the *Gardeners' Chronicle* especially. Where failures, through whatever cause, have been experienced, endeavour by extra attention to avoid the same another season. Where successes have been attained, maintain the same by all means, and improve on them where possible. Any contemplated alteration or addition should now be well thought over before the work becomes too pressing.

It adds greatly to the interest derived from plant culture if each succeeding year some alteration or variation is made. I mean by this, avoid if possible one year being a counterpart of another by maintaining the same stock of everything, thereby causing a monotony in the arrangements. Every year brings some new and serviceable plant to light, that may with propriety be added to the most limited collection. Each year also some old and frequently neglected plant is produced in better condition than usual; an instance of this is to be seen in the splendid racemes of flowers of *Bignonia venusta* that were sent to the last meeting of the Royal Horticultural Society (Floral Committee) by Mr. Greco. This and many more climbers might with advantage be added to most collections, causing less use of artificial shading during the summer, besides giving a good return in cut flowers. No doubt climbers are best grown than they would otherwise be, through the harbour they give to insects and the difficulty of getting at these pests when the plants are trained on the roof. Every true lover of plant culture will make a determined stand against such as mealy-bug, brown and white scale; where the first-named is once eradicated (which I am glad to say is the case here) a far greater amount of time can be given to other subjects that are appreciated. New orders for a few weeks, an extra exertion should be made towards cleanliness where any of these insects are troublesome. *J. Hudson, Gunnersbury House, Acton.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Jan. 9	Sale of Lilium auratum and other Lily Balls, at the Auction Mart, by Frotherick & Mort.
TUESDAY, Jan 10	
WEDNESDAY, Jan 11	Royal Horticultural Society: Fruit and Floral Committee, at 11 A.M.; Scientific Committee, at 4 P.M.
THURSDAY, Jan 12	Sale of Orchids, at Stevens' Rooms.
FRIDAY, Jan 13	Sale of Roses, Shrubs, &c., at Stevens' Rooms.
SATURDAY, Jan 14	Sale of Imported Orchids, at Stevens' Rooms.

HORTICULTURE is just now far in advance of the Calendar. Like most of the Christmas annuals, many of our plants and flowers are a long way ahead of the season. It would in fact be nearer the truth to affirm that modern horticulture aims at making summer perpetual. It goes far towards linking all the seasons into one grand perpetual galaxy of beauty and plenty. There may be some reason to complain of the perpetuity of beauty. Nature's order in these temperate climes is first bare boughs, then in succession tender leafage, glorious blossoms, rich luscious fruits. Were spring or autumn permanently with us neither would be so keenly enjoyed. Change not only quickens the perception but intensifies our enjoyment of beauty. Time is also needful for each season to make its proper impression, hence there may be some danger in over-accelerating the order of Nature. There is more still in upsetting it by presenting a permanent mixture of all the seasons throughout the entire year. No doubt such mixtures are rich as the cream of the season, but what they gain in this direction they lose in freshness and distinctness; and change of scene or of subject is as needful to the gratification of a healthy taste as change of food is to the preservation of our bodily health.

The dawning of a new year suggests such changes, though every season it becomes more difficult to make them. For weeks, perhaps months, past, autumn, as represented by hosts of Pelargoniums, has been overlapping such characteristic spring and summer beauties as Lilies of the Valley, Cyclamens, Hyacinths, Narcissus, Tulips, Violets, Lilacs, Spiræas, Deutzias, Roses, Primroses, &c. Avaleas and Camellias in not a few cases, too, seem about to exchange places—the former flowering earlier, and the latter later than usual. Then there is the emphatically winter-flowering Chrysanthemum, no longer satisfied with lighting up our fogs in November, but flowering in the open air at Midsummer, and some of the later Japanese varieties attempting to soften the stern winds of March with the rich glare of their beauty. This is too bad; and however we may condone the mixture of the seasons by other plants, the Chrysanthemum might surely be content to warm up, if not chase away our dreary November fogs. Still, with the new year ought to come new plants and fresh arrangements; perhaps we ought to add, more verdure and less glare. The latter cannot well be overcome from November to January. With the sun out of sight, or out of power, there is little fear of an excess of colour, but the new year brings more light, and mostly a fair share of sunshine. An April-like verdure is seldom more welcome under glass than in January. The fresh, tender leaves of Roses, Lilacs, Crataegus, &c., are welcome to the eyes after the glare of Chrysanthemums, Pelargoniums, Camellias, as summer showers; not, however, that Camellias, unless over-bloomed, are deficient in verdure. On the contrary, no plants preserve a better balance of green and gay. Still their leafy leaves are far more suggestive of wintry hardness than of springlike tenderness, and there is a most forcible contrast between Camellia and Rose leaves.

Notwithstanding the growing love for Ferns and foliage plants, it will hardly be disputed that many show-houses are ruined by glare. There is little objection on grounds of taste to a blaze

of beauty now and again, but to have houses ever ablaze is well-nigh as oppressive as if the sky were without a cloud from January to December. To cultured tastes greens are as grateful as clouds at sultry noon. By thus lessening the amount of bloom we heighten its effect, but the chief point we wish to dwell on here, is the desirability of adhering to seasonable arrangements inside as well as out. The climate arranges the latter for us, and we need not blindly follow Nature either in regard to time or material.

For example, instead of one spring a year we might have two or four, and the same holds good with other seasons. The main thing is to see that we have spring, summer, autumn—in a word, to conjure up by our own arrangements any of the seasons at will. This would, no doubt, prove more difficult than the usual mixtures, but it is far more satisfactory. Indiscriminate mixtures result in monotonous weariness, while seasonable arrangements possess the charms of freshness, naturalness, and novelty. There is no need for the seasons inside and out to run abreast; in fact, such arrangements would be mistakes. When winter reigned without, April could be represented within; when April arrives, June or July might be represented indoors; and so on of any other seasons.

The adoption of some such ideas would do much to alter mere capricious or erratic modes of arrangement, and lead decorators to reach a higher art, of studying to imitate Nature in her best moods and richest seasons, and aim a fatal blow at that monotony which fetters taste and renders freshness and originality almost impossible.

IN the Report of the New Products Commission appointed to report on the question of the introduction and cultivation of new cultures in Ceylon, we find a letter of Mr. THISELTON DYER'S, giving some inkling of what some of the Colonial planters seem to expect from Kew. Applications from Ceylon only, at the rate of two or three a-week, pour in, and "bushels" of seed of the Para (Hevea) and Ceara Rubbers (caoutchouc) are requisitioned. It is obvious that Kew could not be expected, consistently with its many other duties, to fulfil such demands as these, and having succeeded in introducing the plants to India and Ceylon, the Kew authorities not unnaturally think that their work is done, and that it is for the Colonial authorities themselves to develop the resources thus placed within their reach. Kew supplies the respective botanic gardens; it is the office of these latter establishments to propagate and distribute the plants received from Kew. On their side the Commissioners appointed to consider the matter in Ceylon come to the conclusion "that it is not the function of the Government botanical gardens to supply seeds and plants of new products in quantities, but that it consists in, and terminates with, their successful introduction and acclimatization."

This conclusion may be sound in principle, but it is easy to see that unless great latitude and elasticity in carrying out the details are permitted, the introduction of valuable plants into the colonies will not be much helped by the mere introduction of a relatively small number of plants, even when multiplied as freely as the resources of the establishment will allow. In addition to the botanic garden, where the nurslings make their first appearance, and are carefully reared during their infancy, experimental gardens on a larger scale are required where the plants can be propagated and grown on a sufficiently large scale to satisfy the reasonable requirements of the planters, who should in some way or another, best determined by the authorities on the spot, directly contribute

towards the cost of the experiments. Dr. TRIMEN'S memorandum on the work done by the Ceylon Botanic Garden in the way of introducing plants of economic value is interesting, in many ways. Particularly we have it shown, when the gardens were for twenty years directed by a succession of gardeners, next to nothing was done, and the gardens languished. Here, as in all similar establishments, scientific knowledge and sound utility have gone hand in hand, and a "practical" head of the gardens has meant stagnation of enterprise and the decline of influence and ability to be of public usefulness. Dr. TRIMEN goes on to show what has been done by the gardens towards the introduction of economic plants in general, Coffee, Tea, Cocoa, and a large number of other food plants, "while the lucrative industry of Cinchona planting was wholly the creation of the Government botanical department; and a course has been since successfully steered which, while affording very great assistance to the planters, has never attempted to enter into competition with them, nor at any time made addition to revenue to be the main object or an object of importance, as in the case in South India and Jamaica, and in Java.

— THE GREAT VINERY AT CHISWICK.—To very many of our readers—gardeners who have passed through the Royal Horticultural Society's Garden at Chiswick during the last quarter of a century—we anticipate that the view on the opposite page of the interior of the great vinery (fig. 4) will be a welcome illustration of a familiar object. As many old Chiswick men will remember, the great house was not originally intended for the cultivation of Grapes, but was built for a conservatory, and was so used until 1857. It is of iron, resting on stone. Its position or aspect is due east and west; its length 180 feet, its width 30 feet, and its height to the apex of the span 30 feet. In 1857, during the tenure of office of Mr. McEVEN as Superintendent, the Camellias and other fine greenhouse plants were cleared out, and the house converted into a gigantic vinery. Inside borders were made to the depth of about 18 inches or 2 feet, leaving a path down the centre about 6 feet wide. The Vines, originally planted alternately one inside and one out, included every known sort that could be procured, and the discovery of some curious facts has been the result of planting such an indiscriminate mixture. The first year after planting the Vines suffered terribly from mildew, so much so that the scheme came near being considered a failure. However, they got over this, and have made a brave show ever since. When many of the sorts planted had been proved and found worthless, the process of weeding out commenced while Mr. EYLES was Superintendent, and has been still more vigorously carried out by Mr. BARRON, who also some ten years ago had the whole of the inside borders cleared out, so that now all the Vines are in the outside borders, which are due north and south, and we need scarcely add that those on the latter and most favoured side thrive and give the best returns. For some few years past Mr. BARRON has been carrying out the extension principle, cutting out a few old canes every year, and running up new ones. The greater number of the present canes are of Black Hamburg, and good late sorts; the average number of bunches is about 4500, which average about 1 lb. weight each; and the annual value of the crop about £400. As may readily be imagined, the labour involved during the thinning and training season is very heavy, and was still more so a few years ago when the whole of this work had to be done on ordinary ladders—and very tedious work it was, as well as somewhat dangerous. The heaviest pressure of work lasts for about six weeks, but does not require so many hands to get through it since Mr. BARRON has had the travelling ladder made, on which eight or ten men can work comfortably, and which two can easily move. We have already alluded to the acquisition of some curious facts with reference to the Vines, and may appropriately mention one or two by way of conclusion. Perhaps the most interesting is that with reference to the Black Hamburg and the Frankenthal, which are now believed to be the same, but

The Gardener's Chronicle,

FIG. 4.—INTERIOR OF THE GREAT VINERY AT CHISWICK. (SEE P. 13.)

[January 7, 1863.

which the Fruit Committee, when they examined the Vines some years ago, considered, and justly so, according to the evidence then before them, to be quite distinct, the Frankenthal having larger and more hampered berries. But (and like an "if" there is a great deal in this) Mr. BARRON subsequently made the discovery that all the canes which had the before-mentioned characteristics of the Frankenthal were planted outside, and all that were considered Black Hamburgs were growing in the inside borders, so that the difference between them as regards the hampering and the extra size was the result only of the difference of treatment. Next in interest to the above is an observation that has been made of the behaviour of a Barbarossa (the Vine seen on the left-hand of the doorway, the west-end of the house), grafted on the Black Hamburg. For a series of years these canes produced magnificent fruit, when the influence of the stock began to decline, and ultimately its good nature became completely exhausted—a fact patent to all familiar with the plant. As regards the heating arrangements we should say that there are two flow and two return pipes on each side of the house, heated independently by one or both of two BURKIDGE & HEALY'S upright boilers; and which have done the work well for over thirty years. Our engraving has been prepared from a very successful photograph, taken last autumn by Mr. FOX, landscape photographer, Market Street, Brighton.

—THE RETIREMENT OF MR. THOMAS MOORE from the joint editorship of the *Gardeners' Chronicle* may now be regarded as an open secret. Whatever his claims to "public and personal regard" may be, it is not exactly for us to say, for as co-workers heretofore with him in the conduct of the *Gardeners' Chronicle* it may, even now that he has left it, appear as though he himself were speaking. But we may make record of facts and bear grateful testimony to the cordial and most valuable co-operation he has given to the conduct of this Journal since the retirement of Dr. LINDLEY—a co-operation never marked by a shadow of unpleasantness, but always marked by a spirit friendly and loyal to his colleagues, to the interests of the Journal, and to the welfare of horticulture. It will gratify many of our readers to hear that a movement has been made towards a public recognition of our friend's labours in horticultural literature as well also of his constant and disinterested devotion to social matters connected with horticulture. The result of the first step in this matter was the formation of a committee charged with instructions to provide—for a time and place heretofore to be determined—a substantial presentation, and with it some suitable expressions of appreciation and good wishes. We are informed that it is the wish of the committee that the subscription should be as general as possible. The Honorary Treasurer is WILLIAM PAUL, Esq., Waltham Cross, Herts; and the Honorary Secretary is MR. SHIRLEY HIBBERD, 15, Brownswood Park, London, N.

—THE NEW YEAR.—Whilst the reflections appropriate to the death of the old year are essentially retrospective, the birth of a new year naturally induces thoughts of a sanguine kind, and "hope springs exultant in the human breast" for the moment, even though sad experience may perhaps chill and wither it ere many weeks have passed. Few of us perhaps can remember a pleasanter or more truly hope-inspiring new year's morn than was that of Sunday last. Eighteen hundred and eighty-two came in like a lamb—a playful frisky lamb, exciting the most pleasurable anticipations of the genial character of its temperament, and of its ultimate development into a quiet, patient, but thriving season. Truly the country presented an unwonted spectacle for the season of mid-winter, for it is a winter robbed of all its terrors, and is as mild as SAMSON shorn of his locks. The records of flowers found out of season and of other unwonted natural phenomena, continue to illustrate that gardens are rejoicing in the winter's leniency, whilst with equal kindness it has done nothing yet by its softness to excite undue alarm in the breast of the oft-perturbed gardener. How pleasant will it be if in this first day of the new year shall be somewhat a type of the hundreds of days that are to follow. We shall yet perhaps get frost, and it may be severe, but if in season it will be productive of no material harm. We shall get storms and

tempests, for they are inevitable visitants, and with them we are now too familiar; but we hope to get in the ascendant warmth and sunshine, a favourable seed-time, a season of generous growth, and finally a harvest of abundance and healthy maturity. Granted these blessings, we can smile at the new year's few inevitable ill-humours.

—NEW CROCUSES.—Mr. MAW tells us that since the completion of his Synopsis he has flowered a new and very curious species from Jaffa, with black anthers, concerning which we hope to hear more shortly.

—THE GENUS ESCOBEDIA.—In looking over, the other day, some very clever water-colour sketches of Guatemalan plants, made in Guatemala by Mrs. OSBERT SALVIN, we were struck with one of the handsome Escobedia linearis. The genus Escobedia belongs to the Scrophulariaceæ, and comprises two species—one, E. scabrifolia, ranging from Mexico to Peru and Uruguay; the other, E. linearis, being apparently restricted to Mexico and Guatemala. Both are very showy herbaceous plants, having unbranched stems, 2 or 3 feet high, and long, tubular, white, fragrant flowers. Neither, we believe, has been in cultivation, and the reason, we suspect, is that they are parasites, though there is no such indication on any of the labels of the numerous dried specimens that have come under our observation. E. linearis has long, narrow, rather rigid leaves, and the white, or rather cream-coloured flowers are curved 5–6 inches long. The rather narrow, slightly curved tube of the corolla suddenly expands into a limb from 2–2½ inches across. Collectors have noted the beauty of the flowers of both species; and as seed is produced in abundance, there can be little doubt that their cultivation has been tried, if it has not succeeded. We are not by any means sure that they are parasites; but, if they are, they cannot be very exacting as to the species of nurse-plant, judging from the variety of localities they inhabit, and the wide geographical area of E. scabrifolia. The latter ranges through about 50° of latitude and nearly 70° of longitude. The thickened roots of both species yield a yellow dye or colouring matter, and bear the names Azafraan and Azafranilla. HARTWEG states that E. linearis yields a dye; and SPRUCE, on a label accompanying a specimen of E. scabrifolia collected in Peru, has a note to the effect that the roots are said to be used for colouring gravies. E. scabrifolia has comparatively short, broad, very rough leaves, and flowers scarcely inferior to those of E. linearis.

—IKORA COCCINEA IN WINTER.—Valuable as these lovely stove shrubs for purposes of exhibition, they are no less valuable as decorative subjects in the plant-stove or for supplying charming trusses of cut flowers for vases during the winter months. A bold truss of I. coccinea in the centre of a flower vase has an imposing effect at any time, and with plenty of green, and a few small choice bits of other flowers, will keep a vase fresh and bright looking for the best part of a week at this season—sometimes longer. Where there is a fair stock of such plants, the matter of half-a-dozen kept at rest six weeks longer than usual would give a supply of flowers of which half-a-dozen trusses would be more thought of than a bushel of Chrysanthemums or such-like flowers, which are called common.

—THE "GARTEN ZEITUNG."—This journal, which is the direct lineal descendant of the *Deutscher Garten* and of the *Monatsschrift des Vereins zur Beförderung der Gartenbau in den Königl. Preussischen Staaten und der Gesellschaft der Garten Freunde Berlins*, is heartily welcomed on its advent. One reason alone should make those who have to write much and cite much rejoice at the change—the tremendously long title of one at least of the parents disappears to be replaced by the much more convenient *Garten Zeitung*. It is edited by Professor WITTMACK, a guarantee of careful and accurate editing and of wide knowledge. The first plate is a coloured one of *Nymphaea zanzibaricensis*, of CASPARY, with a full descriptive notice by that eminent botanist. A descriptive article on the Palm-house at Herrenhausen, with woodcut illustrations, follows, and a plan and illustration of the Rose garden in the grounds attached to the new palace at Potsdam, the residence of the Crown Prince and Princess of Prussia. The text of the new Vine-loose Convention, held at Berne,

is given in full, together with reviews of new plants and various other subjects of interest. The promise of the new journal is high, and we have no doubt that it will be realised. PAUL PAREY, of Berlin, is the publisher.

—CONTINUOUS FLOWERING OF ALLAMANDA HENDERSONI.—Plants that are easily and rapidly cultivated like the Allamanda are those which are best suited for winter flowering, and the only requisite indispensable in their cultivation in winter is plenty of heat. We recently saw a pair of plants trained up the end of a Fire-stove that have been flowering for nearly nine months, and the plants are not much over eighteen months old from the cutting. They are now bearing a profusion of flowers which are much sought after, much below the normal size, but none the less pretty. There is no secret in the production of winter flowers in the case of this plant; all that is necessary is to keep a plant or two at rest as long as possible, and to place them in a house where they can have plenty of heat in winter, when they will grow and flower *ad libitum*.

—"ILLUSTRIRTE MONATSHEFTE FÜR DIE GESAMMT INTERESSEN DES GARTENBAUES."—This is the first number of a new series of Dr. NEUBERT'S *Deutsches Garten Magazin*. It is edited by M. MAX KOLB, Curator of the Munich Botanic Garden, and Dr. J. L. WEISS, of Munich. Like its Berlin contemporary this periodical likewise opens with a plate and description of the new Zanzibar Water Lily, raised from seed sent home by the late excellent traveller HILDEBRANDT from Zanzibar, and described by Professor CASPARY. Another coloured plate represents the singular orange-red Tillandsia Zahnii. GUSTAV WEISE, of Stuttgart, is the publisher.

—THE SEASON.—MR. HENRY FARRANT, Treew Gardens, Letterston, South Wales, sends us evidence of the unusually open character of the season in his locality, in the form of a handful of flowers gathered from the open air, and including monthly Roses, Stocks, Pansies, Polyanthus, double Primroses, Vinca major, Virginia Stock, Pyrus japonica, Berberis Darwinii, and Snowdrops.

—EXTRAORDINARY GOOSEBERRIES.—The most extraordinary Gooseberries we ever saw, to surpass which the most accurate memory of the oldest inhabitant must be severely tested, are two now before us measuring 1½ inch in circumference, and sent us by an obliging correspondent in South Wales—MR. FARRANT, Treew Gardens, Letterston.

—STATICE PRO USA IN WINTER.—We are often not so familiar with the usefulness of common plants as we might be. We grow them to flower at a certain season, and we expect no more. The plant under notice is not often seen as gay as it is now at Manor House, Hampton, where several plants are quite aglow with the bright blue spikes of flowers and healthy green leaves. The variety, as is well known, is of dwarf habit, and Mr. CATCHOLE by liberal cultivation succeeds in keeping the plants in flower nearly all the year round.

—PERSIAN LILAC IN JANUARY.—A remarkable example of the forward condition of flowering shrubs is now exemplified in the gardens of Manor House, the seat of J. P. KITCHEN, Esq., near Hampton, Middlesex, where several bushes of the Persian Lilac are in full flower and have been for some time past. Two months ago the plants were in an open border, were lifted, potted, and put in an ordinary greenhouse, from which they have never been removed. The temperature of the house never exceeds that of a warm greenhouse, say a mean of 50°. The fragrance of the Lilac is always welcome, but it is especially so when associated with Roses in bud and other choice flowers, as it is in Mr. KITCHEN'S garden at the present time.

—TROPÆOLIUM BALL OF FIRE.—Most people will have heard of GARRICK'S Villa, or if they have not we suppose there are few who have not heard of the great actor who gave it its name. Among interesting as well as useful plants now in full beauty at the place, which is occupied by Mr. GROVE, is a fine plant of Tropæolum Ball of Fire. The plant occupies a little house by itself, in which Melons are grown in summer. After the Melon crop is cleared

away the plant which is the subject of these remarks was lifted from the open ground and planted in the Melon bed, where it has flourished amazingly, and covers the trellis from end to end of the house, and produces large quantities of its bright scarlet flowers. The wires are within a short distance of the glass, which no doubt increases the floriferousness of the plant, and its strength is maintained by its rich root run in the Melon bed. The plant was taken up out-of-doors at the end of September.

— AGAVE AMERICANA.—From Nice Mr. W. O'MAHONY has obligingly sent us a photograph of a plant which flowered there last season, the height of which was 31 feet, and the circumference of the flower-stem, close to the ground, 3 feet. Our correspondent remarks that several plants flowered at Nice last season, but none equal to that under notice, which grew in the gardens of the Château de Barla.

— ALKALI, &c., WORKS REGULATION ACT.—The Act "to consolidate the Alkali Acts of 1863 and 1874, and to make further provision for regulating alkali and certain other works in which noxious or offensive gases are involved" (44 and 45 Vict., cap. 37) came into operation on Jan. 1. It provides for the registration of alkali, sulphuric acid, chemical manure, gas liquor, nitric acid, sulphate and muriate of ammonia, and chlorine works. The owners of such works are to use the best practicable means for preventing the discharge of noxious and offensive gases from them, and they are to be under the supervision at all reasonable times of the inspectors appointed by the Local Government Board. The penalty for an infringement of the Act is £20 for the first offence, and £50 for every subsequent offence, together with a further sum, not exceeding £5, for every day during which such subsequent offence has continued, to be recovered in the County Court from the owner, or (if he has used due diligence to comply with the Act) the actual offender, in his employ.

— WHEAT-MILDEW AND BARBERRY BLIGHT.—Once upon a time farmers believed that the blight of the Barberry developed into the mildew of the Wheat, or at least that the two were in some way connected. The notion seemed so improbable that it was ridiculed. Then a reaction came, and it was established, as supposed, that the crude observation of the agriculturist was after all correct. But now Mr. FLOWRIGHT contributes to the controversy the record of a considerable series of carefully conducted experiments, from which he concludes that while 76 per cent. of Wheat plants, purposely infected with *Ericium* from the Barberry, ultimately showed the presence of Uredo, 70 per cent. of similar plants, grown in various places and which were not infected, yet showed signs of the presence of the Uredo. We must still keep "an open mind."

— GAILLARDIA PICTA, VAR. LORENZIANA.—We have already noticed this beautiful and singular variety, in which the ordinary strap-shaped ray florets are absent and the whole globular flower-head consists of tubular 4-5-lobed florets like those of an *Asperula* or *Galium* and variously coloured. M. LORENZA, of Erfurt, the fortunate raiser of this novelty, sent us several specimens last autumn, and has now issued a nicely executed coloured plate, showing various specimens of this variety, which, if a good grower, is sure to become a favourite.

— ANNUAL DIANTHUSES FOR CUTTING.—It is only those who have some glass at their disposal that can enjoy the pleasures of the fragrant Clove Carnation and Picotee: but this loss can to some extent be compensated for by growing in the open air during the summer some of the fine annual Dianthus, which the Continental raisers have so improved of late. They lack the fine fragrance which rises up from the petals of the Carnation; but they are not without some sweetness. The best forms to cultivate are the double white and double red varieties of *D. Heddewigii*, and the double white and double crimson of *D. chionensis*, the latter for choice. The seed can either be sown early in spring, in pans, and transplanted when large enough to some good soil in the open air; or sown thinly in drills in the open ground. But good soil is a necessity, if fine flowers and plenty of them are to be had by the grower. The flowers can be made of great use in many ways, and they are very durable.

— OUR ALMANAC.—With the present number we present to our subscribers a Coloured Supplement in the form of an Almanac, from the hand of Mr. W. H. FITCH, who, it will be seen, has incorporated in his design portraits, in miniature, of many of the leading floral favourites. Besides the Calendrical matter proper, our readers will find the dates recorded on which the principal meetings of various scientific societies will be held, as also the days appointed for holding the floral exhibitions of the leading horticultural societies during the year, so far as was known at the time of going to press. The column of mean temperature is taken from the average of forty years' observations at Chiswick, as reduced and verified by Mr. GLAISHER.

— COMPARATIVE STUDY OF THE VEGETATION OF VESUVIUS AND ETNA.—The *Nuovo Giornale Botanico Italiano* for the current year contains a detailed comparison of the floras of these two mountains by P. BACCARINI. Independently of an interesting introduction, there is an enumeration of the flowering plants and Ferns found in the two regions in parallel columns. The most striking feature is the disparity in the number of species. The total number on Mount Etna is 3132, whilst there are only 2042 in the whole kingdom of Naples.

— PENTAS CARNEA.—Among winter-flowering subjects this pretty Rubiaceous plant should find a place, as it is not difficult to manage, and is easily grown into specimens. It is one of those useful things that are receding from cultivation, and that is sufficient reason why attention should be called to its undoubted merits. A successful grower of this pretty plant strikes cuttings in March and April, taking care to screen them from strong sunshine, and cautiously supplying the plants with water while young to prevent them from receiving injury from either cause, as a check at this stage prevents good plants being formed. When rooted they are repotted in a soil composed of equal parts of loam and leaf-mould, with a fair sprinkling of sand. They are then plunged in a gentle bottom-heat, and grown on with care. To have the plants in flower in winter it is necessary to stop them during the summer, and shifting must be carefully attended to keep the roots from becoming pot-bound. The time at which the stopping of the shoots should cease depends upon the time when it is required to have the plants in flower; and when this arrives a profusion of large heads of flesh-coloured blossoms of tubular shape are produced. The plant is of such an accommodating character that it is scarcely run out of bloom, and the flower-heads are well adapted for use in bouquets. There is a pretty rose-coloured variety which is similar to the type in all respects, save in the deepened colour found in the blossoms, and it is equally useful.

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending January 2, issued by the Meteorological Office, London.—The weather has been cloudy or dull everywhere; but while it was comparatively dry at our eastern and south-eastern stations, in all the south-west and western parts of the kingdom it was unsettled and rainy. The temperature has been above the mean in all districts, the excess in "Ireland, S." and over Scotland being as much as 4°. Readings, although lower over central and eastern England than elsewhere, were rather uniform. Very little frost occurred in any part of the country, the lowest reading (28°) being registered at Markree on December 28. The maxima were lowest (51°) over "England, S.," and highest (55°) in "Ireland, S." The rainfall has been rather less than the mean in the "Wheat-producing Districts," and a little more than the mean in the "Grazing Districts." The bright sunshine percentages show a slight increase in most places, but are still low, varying from only 2 in "England, S.," and 8 in "England, N.W.," to 38 in "Scotland, E." Depressions observed:—During the whole of this period the barometer has been highest over the southern portion of our area and lowest to the northward and north-westward. Several depressions (none of which, however, were very serious) have passed in a northerly or north-easterly direction over, or outside, our western and northern coasts. Southerly to westerly winds have been general, and though moderate to fresh on most days, they rose to a slight gale in the west on the 29th, and to a fresh to strong gale in several parts of the kingdom on January 2.

KING'S MEADOWS,

The seat of Sir Robert Hay, Bart., is situated in Peebleshire, 22 miles south of Edinburgh, and 1 mile east of the county town of Peebles. It is nearly 500 feet above the level of the sea, and nicely embellished with woods of great extent, with many grand specimens of the hardier sorts of trees. A few years ago this place was rather celebrated for its collection of Conifers, Rhododendrons, &c., but these severe winters of late have played sad havoc among all sorts of shrubs, and only the most hardy have escaped. It has been nothing uncommon, last winter especially, for the glass to register from 36° to 40° of frost for nights in succession. What struck me as rather remarkable was to see large specimens and groups of Rhododendron ponticum killed outright, and others nearly so, while the hybrid section of equal size were hardly touched. The district here is extremely healthy, and excepting in the valley of the Tweed the surroundings of King's Meadows are hilly, many of the mountains are finely curved in their form and beautifully verdant, having none of those wild precipices which characterise many of the mountains in the Highlands.

On many of these mountains are the remains of British camps, while the district is rich in classic associations. Looking west from King's Meadows, about half a mile distant, the eye takes in the new town of Peebles, or as it is known by the name of King's Muir. Here there is St. Mary's Mount, the beautiful residence of Alex. Tod, Esq., with its grand conservatory, also King's Muir Hall, the residence of — Ritchie, Esq., a place long noted for the immense number of bedding plants turned out and their artistic arrangement. To the south is Hayston with its grand avenue of trees and stately old mansion whence the family of Hay take their designation, and about 5 miles south stands the Black Dwarf's cottage, celebrated in Sir Walter Scott's novel of the *Black Dwarf*. Chambers in his *History of Peebleshire* records that Sir Walter visited the Black Dwarf, where doubtless he received those impressions which afterwards figured in the character of Elshender, and on to the south is Dalwick House, the seat of Sir James Naesmyth, a place long celebrated for its fine old trees, but more recently for its extensive and rare collection of Conifers; but here as elsewhere, frost has played sad havoc, but not so much as at King's Meadows. Many fine varieties have been entirely killed, and others so much injured that they are past recovery. About 2 miles west is situated Stobo Castle, the seat of Sir Graham Montgomery, Bart., which stands on a rather high elevation facing the River Tweed—one of the most beautiful and picturesque mansions in the county, celebrated for the extent of its park scenery; and 2 miles distant is the Roman camp at Lyne, dating from the era of Agricola, 1800 years ago, and which is in a wonderful state of preservation. To the north again as some distance is Dringletie, the residence of J. Wolfe Murray, Esq., a place long noted for its majestic trees; and further on, still northward, there is Darnhall, the seat of Lord Elibank. Here had been got together (the work of years) a grand collection of trees and shrubs many of them of great size, but here I may mention, the intense frost of last winter has done its dire work—little escaped its ravages. On towards the north-east is Portmore, the seat of Colin J. McKenzie, Esq., where there is one of the finest collections of Camellias in the country, and of which the owner is justly proud. Here lived John McLean, a name well known in the gardening world, who served as head gardener at Portmore for the long period of fifty-three years. The old man now has his free house on the estate, and a substantial pension. About a mile above Peebles there is Neidpath Castle, an old baronial fortress built in 1300. It was here that the now well-known Neidpath Vew originated.

Peebles proper is a very pretty town. The quaint Dr. Pennecook enlarges on it in his usual style of verification—

"Peebles, the metropolis of the shire,

Six times three crosses hath from me require.

Three streets, three ports, three bridges it adorn,

And three old steeples by three churches borne.

Three miles do serve their turn in time of need,

On Peebles' water and the River Tweed.

Their arms are proper, and point out their meaning,

Three salmon-fishes nimbly counter-swimming."

Peebles for many years has supported one of the most flourishing flower shows in the country; it has also its Chambers' Institution, which cost many thousand pounds, and has a library of 17,000 volumes, all the gift of William Chambers, Esq., LL.D., whose seat, Glenmiston, is in the neighbourhood, situated on the southern slope of Leech-pen, one of the highest hills in the district, and about 1 mile east from Peebles, and equidistant north from King's Meadows. On the Toonhouse Brae stands the new Peebles Hydrostatic Establishment, which for beauty of situation, elegance of architecture, and for the comfort of the visitors is allowed to be one of the finest of the kind in Scotland. Another fine feature connected with this establishment, to be introduced by-and-by, is that all shrubs, trees, and plants of note are to be correctly and legibly named.

About 1 mile east of the Hydrostatic, the River Tweed is crossed by a very handsome iron bridge; to the left lie the beautiful woods and policies of Kailzie, belonging to W. C. Black, Esq. To the right from the bridge the walk curves round sharp, by following the windings of the river till the mansion-house of King's Meadows is reached. Although the house stands in rather a low situation, the views from it are very extensive and varied; the river flowing past within a few hundred yards of the house adds an additional charm to the grounds. From the house an 8-foot walk leads on to the south-east in gentle curves through a mixed plantation of shrubs and trees till the kitchen-garden is reached, which is in two divisions; that to the north is the kitchen-garden proper (which outside and in is over 3 acres in extent), surrounded by a substantial wall 12 feet high. Here in ordinary seasons all sorts of outdoor fruit are had in abundance.

The glass erections are rather extensive, and placed to the south of the kitchen garden. Entering from the west the first, No. 1, is a Peach-house, 55 feet by 9 feet, with curved trellis in front, back wall planted also. The sorts grown are Noblesse, Barrington, Late Admirable, Lord Falkenstein; the last mentioned is a great favourite, being large in size and of fine flavour. Nectarines Filruge and Violette Blâve are both planted here, and a better display all over the house no one could desire to see. No. 2, early Peach-house, 55 feet by 9 feet: at the time of my visit the crop was nearly finished, but the few remaining showed examples of large and fine fruit. No. 3, 27 feet by 14 feet, Black Hamburg-house, excellent crop. No. 4, 27 feet by 14 feet, also Hamburg-house (early), very fine crop all over, many of the bunches being extra large. No. 5, 27 feet by 14 feet, late viney, newly replanted with the most approved sorts. No. 6, 27 feet by 14 feet. Late viney, very fine regular crop; in this house Mrs. Pine's Black Muscat and Alicante, extra large both in bunch and berry; on the back wall two trees of the Brown Ischia Fig bearing excellent crops—this variety never fails here. No. 7, 55 feet by 9 feet: Peaches on back wall, one year planted, and Tomatos in front. No. 8, 55 feet by 9 feet, Fig-house, planted front and back, good crop all over, Castle Kennedy being especially fine. No. 9, span-roofed, 25 feet by 10 feet, principally used for growing soft-wooded plants for the conservatory. No. 10, stove, 22 feet by 12 feet, span-roofed, contains a miscellaneous collection of plants, principally for cut flowers, in fine condition. No. 11, 12 feet by 20 feet, span-roofed: in this I found a fine collection of plants. The roof was covered with Stephanotis, Dipladenas, Allamandas, and Bougainvilleas, a mass of bloom, the latter extra fine. No. 12, Melon-pit, 37 feet by 9 feet: a very excellent crop all over the house, Bechwood and Perfection being especially good. No. 13: in connection with this house is a span-roofed conservatory, facing south, a very handsome erection, containing many beautiful and well-grown plants. The following were very conspicuous:—*Lagerflora rosea*, beautifully flowered, trained on a wire balloon, 4 feet in diameter; several *Statiche Rattayana*, averaging 3 feet in height, and as many through a very fine plant of *Tasmania Van Volsenii*, and some finely-managed *Camellias*, *alba plena* being particularly fine. Here is grown a very select collection of *Fuchsias* and *Delphiniums*.

The flower garden lies in front and to the south of the glass erection, and is about an acre in extent. The Peach and Vine borders are all ribbed with the most approved sorts of bedding-plants, and in front of these there is a gravel walk, 7 feet wide, which runs the whole extent of the garden from east

to west; to the south of this walk there is a very pretty design of figures cut in the grass filled with the ordinary bedding-plants. I may mention here that Lady Hay takes great personal interest in this department, hence the arrangement of colours is particularly well carried out. As the glass accommodation is extensive, every exertion is used to have the plants well forward before being turned out, so that the bloom may be well over before the early autumn frosts set in; by the above system a very brilliant bloom is had early in summer. What is rather strange, the Hollyhock grows and blooms here magnificently without any trace of disease. Mr. McFarlane, Sir Robert Hay's head gardener, has filled his present situation for the last twenty-six years with much satisfaction to his employer and credit to himself.

Mr. McFarlane is an ardent horticulturist, and been one of the most successful competitors in the district. Although not the originator of the Leek Club, he has been one of its keenest supporters; it had its small beginning, but is now one of the most flourishing societies of its kind in the South of Scotland, and at which all sorts of vegetables are competed for, and has been of immense advantage to the working classes in the district. It has been no unusual thing, when Leeks were exhibited from King's Meadows at it, for one Leek to weigh over 5 lb., and six over 22 lb. *John Doonan*.

THE GENUS MAURANDIA.

IN the collection of dried plants made by Dr. E. Palmer in the North-eastern States of Mexico, a set of which has been acquired for the national herbarium at Kew, is a very distinct new species of *Maurandia*, for which I propose the name *erecta*, because it differs from all the other species in not being either a climber or a trailer. As an ornamental plant it is perhaps not equal to any of its congeners, reminding one rather of the genus *Martynia* than *Maurandia*; but as apparently good seeds of it have been sent to Kew, it may be worth while giving a brief description of it here. It may also be worth while giving an account of the genus *Maurandia* as now commonly circumscribed, especially as some confusion exists in the garden nomenclature of one or two of the species. Thus *M. erubescens* is commonly cultivated as *M. scandens*, and the true *M. scandens* is seldom seen. These plants are better known to gardeners as *Lophospermum scandens* and *L. erubescens*. Dr. Asa Gray was the first to propose the amalgamation of *Lophospermum* and *Maurandia*, retaining the latter older name for the genus; and this proposal has been adopted in *Dentham and Hooker's Genera Plantarum*. As thus constituted, the genus includes six species, which may be distinguished from each other by the following key:—

- Erect herbaceous plant M. ER. EA.
- Climbing or trailing; herbaceous or somewhat woody plants.
 - Seeds small, corky rugose or granular, wingless.
 - Flowers dark blue, calyx furnished with long glandular hairs M. BARLAYANA.
 - Flowers pale purple, calyx quite naked M. SEMP. FLORES.
 - Seeds oblong, nearly flat, slightly auriculate and furnished with a narrow entire wing M. WISLIZIENI.
 - Seeds corky rugose, and furnished with a circular, lacinated wing.
 - Leaves and flowers downy M. REIDENSIS.
 - Leaves and flowers almost quite glabrous M. SCANDENS.

Like many other plants that were first described from cultivated specimens, several of the species of *Maurandia* were described and figured by different authors under diverse names. Fortunately in amalgamating the genera *Maurandia* and *Lophospermum* it has been possible to retain the specific names commonly in use. All the species inhabit the Mexican region. The synonymy and references to published descriptions and figures of each species follow:—

1. *M. erecta*, Hemsley, n. sp.

* *M. erecta*, Hemsley, n. sp.—Herba erecta ramis, undique glandulosa pilosisque viscosa; FEMUR crassiusculis, dense foliosis. Filio longe pedicellato, crassiusculo, lamina orbiculati cordata vel intertenui fere rotundata, obscure lobata vel grosse crenata, usque ad 1/2 pollicem petiolo, subgloboso vel globoso, usque ad 1/2 pollicem longis. Flores axillares, solitarii, coccineo rubri; poll. longi; antheris filibus longis, calycis segmentis glandulosis villosis, pediculis 5-6 lineas longis, 5-6 lineas longis, 1-1 1/2 lineas viscosis, oblongis, obtusiusculis, calycis segmento glanduloso villosis, lobis longis, leviter oblongis. Capsula calyce persistente circumscissile, alba imbricata vel lacinata.—Mexico boreali-orientalis, a cl. Palmer lecta.

An erect, glandular, hairy, herbaceous plant, with Mallow-like foliage, and medium-sized flowers, the colour of which is unknown to me. These seeds are almost exactly like those of *M. erubescens*. San Lorenzo de Laguna, (Cahulla, North Mexico) lately discovered by Dr. Edward Palmer.

2. *M. Barlayana*, Lindley, Bot. Reg., t. 1108; Loddiges, Bot. Cab., t. 1381; *Chivanensis*, Monogr. des Antirrhin., t. 2; DC. Prodr., x., p. 267.

First cultivated by Mr. Robert Barclay in 1827. A handsome greenhouse climber, succeeding well in the open air in summer. North-east Mexico, in the mountainous regions, at considerable elevations.

3. *M. sempiflorens*, Ortega, Nov. Gen. Hort. Matr. decas, ii., p. 21; Jacquem. Hortus Schoenbrunnensis, iii., t. 283; Bot. Mag., t. 450; Reichenbach, Exotic Flora, t. 291. *Usteria scandens*, Cavailles, E. Pl., ii., t. 116; Andrews, Botanist's Repository, t. 63; Herbar. général de l'Amateur, t. 279. *Maurandia scandens*, Persoon, Synops., ii., p. 165, not of A. Gray. *Reichardia scandens*, Roth Catal., n., p. 64.

This, as we learn from Andrews, was first cultivated in this country by the Marchioness of Bute in 1797, having been raised from seed sent to her ladyship from Spain by Dr. Ortega. A native of South Mexico and Guatemala.

4. *M. Wislizeni*, Engelmann, in Torrey, Bot., U.S. and Mex. Bound. Surv., p. 111; A. Gray, Synoptical Flora N. Am., ii., p. 251.

As far as I am aware this species is not in cultivation. It inhabits the banks of the Rio Grande del Norte, and is remarkable in the genus for its calyx becoming indurated.

5. *M. erubescens*, A. Gray, in Proc. Amer. Acad., vii., p. 377. *Lophospermum erubescens*, D. Don, in Sweet's Brit. Fl. Gard. 1830, ser. 2, t. 75, in a note; Zuccarini, in Flora, 1832, ii., Heubl., p. 61; DC. Prodr., x., p. 267; Bot. Reg., t. 1381. *Lophospermum scandens*, Sweet's Brit. Fl. Gard., ser. 2, t. 68; Bot. Mag., t. 3037 and 3033, not of Don.

This is the plant commonly cultivated up to the present time as *Lophospermum scandens*, in consequence of Don himself having confused it with his *L. scandens* about fifty years ago. The mistake was made in the October number of Sweet's *British Flower Garden* for 1830, and rectified in the November number for the same year; and it is another instance of the impossibility of suppressing erroneous names that have circulated in gardens and garden literature. Botanists, too, with the exception perhaps of Lindley in the *Botanical Register* as quoted above, have overlooked Don's rectification, and attributed the name *L. erubescens* to Zuccarini. The true *M. erubescens* is easily distinguished from *M. scandens*, by its being clothed with a soft clammy down, by its coarsely-toothed almost 3-lobed leaves, and by its paler rose-red flowers. This species was first cultivated in this country about fifty years ago; and the first plants were raised from seeds taken from dried specimens in Lambert's herbarium, collected by Moçino and Sessé, A native of the mountains of Southern Mexico.

6. *M. scandens*, A. Gray (not of Persoon), in Proc. Amer. Acad., vii., p. 377. *Lophospermum scandens*, D. Don, in Trans. Linn. Soc., xv., p. 353; Sweet's Brit. Fl. Gard., ser. 2, t. 401; Bot. Mag., t. 3650; Marten, Botmist., t. 17.

First cultivated in this country about 1835 from Mexican seeds raised in the Liverpool Botanic Garden. Easily distinguished from *M. erubescens* by the leaves and heart-shaped being nearly glabrous, by the leaves being heart-shaped in outline, and by the deeper hue of the flowers. I have not seen living plants of this species, but the dried specimens are distinguishable at a glance. Neither have I seen wild specimens of it.

Maurandia antirrhinoides, Humboldt and Bonpland (*Bot. Mag.*, t. 1043), from the same region, is now referred to *Antirrhinum* (*A. maurandioides*, A. Gray), on account of its personate corolla.

Another plant that one can hardly avoid mentioning here, is the allied *Rhodochiton villosa*, Zuccarini, *Bot. Mex.*, t. 3367; *Fl. Rep.*, t. 1755. *Lophospermum Rhodochiton*, D. Don, in Sweet's *Brit. Fl. Gard.*, t. 250. It is likewise a Mexican plant, and remarkable for its ample purple calyx associated with a darker purple corolla, *W. B. Hemsley*.

HOME CORRESPONDENCE.

Cratægus Azarolus.—Without doubt the above is one of the most showy and attractive species of the family to which it belongs, and to those of your readers who at the present time are engaged in planting—no matter whether on a large or small scale—I would unhesitatingly say, do not fail to include this Thorn in the list of what are intended to form permanent objects of beauty and interest. It is admirably adapted for planting out either in parks or on lawns, and is well adapted for the advantage of being either standard or planted out singly. Its bright orange-scarlet haws, which are of great size, render it for many weeks in the autumn a very conspicuous object indeed, and a few well-established standards with their beautiful umbrella-shaped heads, dotted about here and there, would add much to the scenery of any English domain where it does not already exist. *J. Horsfield, Heyshbury.*

Crinum amabile.—I send you a flower of *Crinum amabile*, one of an unusual of twenty-two flowers and buds; a most beautiful flower and noble plant for large stoves at this season. In Mr. Baker's valuable synopsis of all known species of *Crinum* there is a good description of this plant. *W. R. Latham, Birmingham.*

Amaryllis aulica.—Visiting the gardens of Coedryfan, the residence of Mr. Traherne, a few days ago, a fine plant of this free-flowering bulb attracted attention. It is a very handsome specimen, bearing five trusses of bloom, which are thrown up from 2-3 feet high, forming a perfect canopy of brilliant crimson-coloured flowers well above the ample deep green foliage beneath. With the exception of two yet unexpanded the whole of the trusses are each carrying five or six blooms of some 4 or 5 inches in diameter, in which the brilliancy of the colouring is enhanced by the contrast afforded by the central stripe of greenish-white about each petal. The specimen is grown in an 11-inch pot, and is, with a few inches of soil, the product of a single bulb shifted on as required, but not otherwise disturbed. The result reflects credit on the system of giving the plant a long rest, adopted by the gardener, Mr. Moor. Associated with *Eucharis* in full bloom—as is the case here—no more effective plant for winter flowering can well be imagined, and it is certainly one that is well worthy of extended cultivation, but, like many others of the order bulbous-rooted plants, is now seldom seen in general collections. Fotted in fibrous loam and thoroughly rotten coddling with a plentiful admixture of coarse sand, well drained to prevent stagnant moisture, and rested during the summer, it will not fail to give satisfaction in the beauty of its flowers and the freedom with which they are produced during a season of the year when they cannot fail to be appreciated. *K. C.*

Mr. Rochford's Boilers.—I have not "condemned" Mr. Rochford's boilers; my power to do so—even if I had the wish—is too insignificant. At the same time, I did not rest my criticism on imagination, but on the facts supplied by "T. B." himself, coupled with the opinion of the "eminent hot-water engineer" whom he quoted as conclusive on the question of the economy of these boilers—the only point I ventured to doubt. I have just received information of a similar boiler fixed only two weeks ago to 1400 feet of piping in a nurseryman's establishment, which, three nights ago, unkindly broke its own heart—or rather an artery—extinguishing its fire with its own life-blood, which overflowed the stoke-hole while its owner peacefully slumbering, confident of his young plants' safety with such a friend and protector. To conclude, I think we have got beyond both "pack-horses" and "carts and waggons" (to which "T. B." compares the boilers) for heavy work; and now-a-days, if I am not mistaken, we steam and even electricity as occupying less space and being far more powerful. *B. W. Warhurst.*

A Plant Label.—May I be allowed to mention a cheap and durable, if not an elegant plant label? It can be made for £1 2s. 6d. per 1000. A hundred-weight of No. 6 galvanised iron wire is cut into lengths varying from 10 to 15 inches, and two cuts are made for each length, one-half through, half an inch from the other, which divides the wire. This wire costs £1, makes 1500 pieces, and the ironmonger charges 2s. 6d. for cutting it up. You lately mentioned Holly and Box-wood labels made by Messrs. Wolstenholme, of Manchester, price 5s. 6d. per 1000. At my suggestion they are now making some square-edged and perforated at both ends. Nine inches of thin galvanised tying wire is passed through the holes, and with this the label is tied to the thick wire, the indenting cut mentioned above preventing it slipping. The tying wire is 5½d. per pound, and a pound makes 500. Last, not least in im-

portance, I must speak of the paint. I have observed that the yellow labels sent by Continental nurserymen continue legible longer than those painted white, which are commonly used. The material used is yellow-brown mixed thick with insect oil; it may be laid on with a bit of rag or tow, but gardeners generally do it with their forefinger. The thinner the coating the better. This when dry presents a surface, on a Boxwood label, to which no dirt will adhere, and the writing of a common lead-pencil will remain visible longer, I believe, than on the commoner wooden label. I enclose specimens. *C. Wolley Dod, Edge Hall, December 20.*

Cineraria Growing.—Visiting the gardens of Thos. Lloyd, Esq., the Priory, Warwick, the other day, I was much struck with the fine lot of plants grown by Mr. Greenfield, the gardener, from seeds sown in the last week in April. They measure from 1 to 2 feet in height, and from 2 to 2½ feet through, with flowers of various colours, and as large as a crown-piece. Plants like these, full of flowers, are very useful at this time of year. The large plants are in No. 8 pots. Mr. Greenfield is the raiser of two new double varieties, named Mr. and Mrs. Thos. Lloyd, the flowers of which are very distinct and valuable for cutting, as they last so long. Fine plants of these will shortly be in flower. *H.*

Rhododendron præcox.—The earliest of *Rhododendrons*, and a never-failing plant to flower at midwinter, is a most useful one, and well worth the moisture. The habit of the plant rather detracts from its general usefulness, but considering that it is amenable to almost any temperature, it is a safe plant for beginners in forcing to invest in. Some years ago it was all the rage for forcing in large establishments, but is now partially neglected. It is most useful for cutting at this season, and supplies a distinct shade of colour which is improved by gaslight. It should be cut in clusters and touched off with Maidenhair ferns. Large bushes of it forced into flower are also useful at this season for other decorative purposes, but on account of its stiff habit it should be associated with Ferns or other plants that would in some degree conceal its deficiency of foliage. *W. Hinds.*

Caladium Tubers.—Who shall decide when doctors differ? is a question which might well be put in reference to the above. I do not presume to decide, neither do I exactly differ from those who have given their ideas upon the matter; but I maintain that it is utterly unsafe to dogmatise upon a point of this kind. Having grown these plants for many years, there can be no harm in giving my opinion, without for one moment attempting to lay down any rules whatever for the guidance of others, which in fact, as will be seen, I am very ill-qualified to do. I have found no difficulty at all in keeping the tubers, and that without any special care. When the leaves have died down in the natural way, after a gradual drying I have simply put the pots anywhere; some have been left on the stages, getting occasionally a good soaking with water, others have been left entirely dry, some have been placed under a stage close to the hot-water pipes, and got as dry as anything could well get; and some have stood where they got a pretty constant supply of water from the stages above. Now in spite of this utter carelessness in their management I can safely say that I never found the tubers the least unsound when I turned them out for re-potting in the spring. But there is one point, and that an important one, which must not be lost sight of. My pots were always kept in a warm house—that is to say, an ordinary stove, where a minimum temperature of about 60° was maintained through the winter. I will not attempt to draw any conclusions, but leave your readers to make what they can of my experience of *Caladium* culture. If I might venture an opinion, it would be simply that it is a matter of slight importance whether the tubers are kept wet or dry so long as they are thoroughly warm. *G. E. Cox, Leytonstone.*

Wall Coping.—Not having noticed any communication in reply to the inquiry of G. R., on p. 82, I will revert to the cheapest and most durable form of coping for kitchen garden walls. I think a few remarks on the subject may elicit information by again drawing attention to what must be, as your correspondent remarks, "of general interest." In the inquiry in question the requirements are cheapness and durability, to which, of course, may be added efficiency, without which no coping would be good, to say nothing of "best." Now, cheapness is a relative term, and in the common acceptance it is scarcely compatible with durability, but in its true sense would include the latter requirement. It may, therefore, be suggested that good stone coping will be found least costly in the end, and will be effectual in the preservation of the wall as well as in the protection of the blossoms and fruit

from wet. The cost of stone will of course greatly depend upon the suitability of that of the district for the purpose, as where it is necessary to procure it from a great distance the carriage alone is a considerable item of expense. Some seven years ago a large proportion of the walls under my charge here were recoped with Forest of Dean stone, which came to hand cut to the required thickness—apparently by machinery, but the face-dressing, grooving, &c., were done by the estate masons, so that I am not able to give cost, but doubtless it will be cheap a hundred years hence. The stones project 11 inches from the walls on the south side, and 8 on the north, so that when they are made to dip. The coping is drilled for bolts at intervals of a foot, and their square heads are counter-sunk and fixed with cement, so that no wet can find its way through, or ice form and split the stone. Temporary wooden coping made of 4-inch loads 12 inches wide, is attached in the spring, as an additional protection from frost, by means of these bolts to which it is tightly screwed up with strong nuts. Bands of iron, which strengthen the boards and prevent splitting, also serve to take the bearing of the nut-bolts by being placed at the same distance apart that the bolts are in the wall. An additional strip of sheet-iron projecting from the end of each board serves to secure it to the next, and when screwed in position prevents warping. In order to stop wet from running back to the edge of the permanent coping on the south side, a bevelled strip of board is attached to the upper edge of the temporary coping, where it is screwed up, to such an angle as to throw off the rainfall from the walls by giving a little dip outward instead of to the wall. Tenter-hooks, which are driven into the edge of the boards at 1 foot apart, serve to fix the protecting material. It is only necessary to keep the boards painted occasionally, which an ordinary labourer could do, and housed out of the wet when out of use, to have an effectual means of protecting the blossom of wall fruit trees that may serve a lifetime; while the permanent coping will protect the fruit and walls from wet as long as the walls are likely to stand. Whatever means of protection be adopted, it seems to me necessary that the wall itself must first be effectually coped and kept dry, and that the temporary shelter be light, durable, easily put up and removed, and neither rendered unsightly by clumsy supports nor left insecure against storms of wind by insufficient fastenings. Perhaps others may give their opinion on glass used for projecting copings, which appears rather liable to breakage in removal and storage, and the supporting framework, which fixed, does not improve the appearance of the walls during the rest of the year. *K. C.*

Leucoum vernum flore-pleno.—It is satisfactory to hear from Messrs. Krelage that they have *Leucoum vernum* fl.-pl. actually growing in their nurseries. I sincerely hope that when it blooms next spring they will send over a bloom, so that it may be figured. I have been searching for this plant ever since I had a garden of my own, but I never met any one who has seen it in the flesh. Krelage is mistaken if this sort goes for nothing. I have this evening been looking through Hill's *Éden*, published in 1757, and Miller's *Gardeners' Dictionary*, 1753. Neither of these authors appear to have either seen or heard of this variety, though they were familiar enough with the single form. The former writer gives plates of several flowers which seem to have been common in his day, but as far as I know are now quite extinct, viz., *Sternbergia lutea* fl.-pl.; the double form of the common yellow Cowslip; and *Polyanthus* variety apparently of *Crocus biflorus*, having a number of flowers and leaves on a stem; a very double form of the old Orange Lily; and last, but not least, "the double yellow Cowslip," which must have been a very fine plant. About twenty years ago Messrs. Youell, of Yarmouth, had in their nurseries a double white Cowslip; they told me it died out gradually, seeming to defy propagation, and had, they believed, become quite extinct. I have not seen for years the double yellow Wallflower with variegated leaves, but doubtless it still exists in some collections. The singular *Narcissus corcyvensis*, which Dean Herbert had in cultivation for thirty years, is quite lost, and also seems to have disappeared from the island of Corfu, where in the Dean's day it grew wild. How is it that no one reintroduces from the Cape the beautiful little *Erodium incarnatum*, which has only died out of cultivation within the last eight or ten years? Why have people ceased to grow the lovely *Monarda*? *H. Hartley Crooks, Drapton-Park, Hampshire, Retort, Tring, Dec. 28.*

The "Caution to Nurserymen."—The object of my letter, which appeared in your issue of the 24th ult., was simply to caution such of my brother nurserymen who might be placed in similar circumstances to myself, and to bring before them the question whether it be, or be not, the custom of our trade for a nurseryman to plant fresh trees in the

event of those dying which were planted by him, it being understood that there is no express condition to that effect. A word or two as to my alleged overstepping the bounds of veracity. That I have done so in any one particular I can safely challenge Mr. Young to prove. My statement was, not that the defendant selected the trees himself personally, but that he selected trees of too large a size, which was the chief cause of their dying. This distinction to nurserymen of my own class would be apparent enough. The instructions I received from the defendant were to select trees of not less than from 18 to 20 feet, which were to be planted on the very spot to which Mr. Young refers, and that for a special purpose, viz., to conceal a tennis lawn from neighbouring windows. This fact discloses of Mr. Young's criticism on that point. As to my burying the stems of the trees to the depth of 15 inches, that is a mere inference from subsequently altered conditions. The trees, when I left them, had each a deep basin round the stem for watering, but these basins had been filled up by an inexperienced servant of the defendant when Mr. Young saw them. Hence his mistaken conclusion as to the 15 inches.

William Aitke, Meadow Nursery, Goldsmiths, Jan. 4.

The Apple-tree Canker.—What is it? What does it proceed from? To these questions there does not as yet appear any satisfactory answer to have been given. On the one hand we are told that it is frost that kills certain portions of the bark, but why is it then, if such be the case, that we find canker on young wood of this year's growth, that had not been under the influence of frost? I enclose two pieces of the wood of the Ribston Pippin, that were cankered before there was any frost. Then again we are told that it proceeds from the roots being in a cold, uncongenial soil, had drainage, &c. But the tree (a Ribston Pippin), from which the pieces sent were cut, as will be seen, was and is in good health and made strong, clean growths of wood, very healthy, with large leaves, bright, downy, and good in colour, and it is growing in about 6 feet to 8 feet deep of yellow loam well drained and on a subsoil of white sand. I merely select one tree out of many that have of Ribston, Cox's Orange, King, and other Pippins. For a number of years I have paid much attention to this subject, and I have come to the conclusion, either rightly or wrongly, that the Apple-tree canker is caused neither by frost nor soil, nor is it constitutional of the sorts I have mentioned. My belief is that it is caused by an insect, but what that insect is I am unable to say. Through a Colingridge lens I have found a number of red nodules, but I cannot determine whether they are the ova of an insect or not. But there is a curious fact about the matter, and that is, that the canker is much more prevalent in the finer sorts of dessert Apples, and also that when I have put on a coating of Gishurst's Compound, mixed with soot and clay, twice a year, there has been no canker in those parts of the tree; and further, when I discover canker is first shown, if I cut out the parts and put on Gishurst's Compound, the bark grows gradually over it. In mentioning this to several eminent entomologists, and most seen to have the same idea as myself—that the canker is caused by some insect. If this be so, what is it? As will be seen from the pieces of wood sent, the bark and wood of the tree is perfectly healthy up to and around the cankerous wound, in fact so full of vigour and growth that it is lagged out around the wound, which has stopped the flow of the sap. Is it caused by an insect that sucks out the juices of the wood just there and so exhausts, poisons, and kills that spot, or what? I am not giving my theory as a correct one, I am only giving my views with the hope of getting more observational information on the subject. One thing is clear to my mind, and that is that the canker is not caused by frost, and I feel myself nearly certain that it does not proceed from the roots being in a wrong soil, as it is found in young thriving trees on the best of soils, and good drainage. Then I ask the question again, what is the cause, and how is it to be prevented? [We refer our correspondent to the article by Prof. Burill published at p. 596 of our last volume, showing the probability that some forms of canker may be due to Bacteria. L.J.] *Harrison Weir, Weirleigh, Brockley, Kent.*

Imantophyllum miniatum.—This beautiful greenhouse plant will now be fast pushing up its flower-spikes, and any one possessing it will do well to expose it to all the light possible in that position. The flowers will be of a deeper orange colour than if left in the shade, where they come pale and are not much to look at. The flowers last a considerable time either on the plant or in water, and come in at a good time of year, when flowers of this description are scarce. It can well be placed in the background, except at the flowering season, without taking any harm, and I have never found it susceptible to insects. It does best when left in the same pot for a long time, and kept well supplied with water at all seasons.

F. Cobitt, Fawley Court.

Florists' Flowers.

SOME NEW PRIMULAS.—It is but a few years since the number of varieties of Chinese Primula was very limited, but now, thanks to the perseverance of our florists, varieties are offered to the public that are a great advance in the novelty of their colours and substance. Passing through the nurseries of Mr. James Tomkins, of Birmingham, the other day, the pleasure was afforded me of seeing a beautiful show of these most useful plants. Staged in a span-roofed house, 60 feet by 11, with a path down the centre, were numbers of the most choice varieties, and close to the older, but still first-class, Princess Louise and Marquis of Lorne, stood a hundred or more specimens of a new one, which Mr. Tomkins has named The Queen. It is a striking variety, characterised by its compact though robust Fern-like leaves, which curve over the pot in a remarkable manner, and bears from three to six trusses of very fine flowers, the individual blooms measuring from 2 to 2½ inches in diameter, of remarkable stout substance, the young flowers opening pure white with yellowish eye, the white changing with age to a beautiful blush. The flowers from their thick texture remain in perfection considerably longer than the ordinary varieties, and being a free seed-bearer it promises to become a novelty. It has received two First-class Certificates (the Royal Horticultural Society and Manchester Botanical, 1881). Mr. Tomkins is also sending out another fine variety of a reddish-scarlet colour, named Emperor, a grand acquisition to the dark varieties, of which at the time of my visit there were some superbly-bloomed plants. Any one interested in Primulas would do well to pay the Sparkhill Nurseries a visit. *F. Denning, Park Grove Gardens, Edgbaston.* [Flowers of both varieties are before us, and we must say they are superb. ED.]

THE FLORISTS' TULIP.—It passeth one's understanding why the Tulip should have become so lightly esteemed during recent years, as it flowers at a time when there are few other hardy flowers in the garden. When the seasons are favourable they flower splendidly without any protection whatever; indeed, favourable or unfavourable, ours always take their chance, and they are always interesting. It is only during the last quarter of a century that the Tulip has fallen into comparative neglect. When John Parkinson wrote his *Paradisus Terrestis*, about the middle of the seventeenth century, the Tulip was one of the choicest flowers in English gardens, and continued to be highly esteemed for 200 years. There were numerous species of Tulips grown at that early date, and one can glean from Parkinson's figures and descriptions that the late-flowering Tulip had taken the form of Roses and bizarres, if not the byblomen as well. There are twenty-four species and varieties figured in *The Garden of Pleasant Flowers*.

Parkinson calls the late-flowering Tulip by the name of *Tulipa serotina*, and one variety is described as being "rose-colour deeper or paler;" another is "yellow with red edges," the type of a feathered Tulip; and one is "yellow with red spots and veins, the bottom black or discoloured." This would be the type of a flamed Tulip. Indeed, several are described as "flamant." Thus one is "white streamered with crimson flames;" another is "a yellow flamant of divers sorts"—that is, the whole flower more or less striped or spotted on the inside, the bottom in most being black, yet in some yellow. The colours in those days were even more varied than they are now. There were white with blush edges, white with blue veins, white with great blush edges, dove-colour, vermilion, orange, ash-colour, snow-white with yellow bottom, pearl-colour, purple, crimson, &c. Parkinson's descriptions of about a hundred varieties shows to us how much the Tulip was cherished by our ancestors. Some of the Northern growers do not care to plant until quite the end of November; we like to get ours in about the second week in the month. We insist on having a deep well-manured soil, but the bulbs are planted in pure loam without any manure. The roots are fine and very numerous; they also run deeply into the ground. The bulbs ought not to come in contact with the manure, and this is the object of planting them in loam; some fine sand is also placed around

them. They require but little attention during the period of growth. We mulch the surface of the ground with rotten stable manure, and nothing more is required until the bulbs are lifted. The time for this is when the flower-stems will bend without breaking. As soon as the Tulips are taken up the beds may be planted with any other flowers to bloom in summer and autumn; the rich soil will do well for Asters or Dahlias. *J. Douglas.*

LATE FLOWERING CHRYSANTHEMUMS.—Attention has lately been directed to the importance of securing a stock of late-flowering Chrysanthemums, than which few subjects can be more appropriate at this time of year. There is always a famine in the matter of flowers after Christmas, notwithstanding that it is quite possible to have a good show of Chrysanthemums for quite another month. Too much time and attention is given to the cultivation of the early-flowering kinds, which are practically over after November, while late-flowering sorts are grown, or rather exist, as individual plants. Mr. Shepherd, at p. 824 of the *Gardener's Chronicle* for December 24, recommends two varieties named Bouquet Parfait and Nelly as good late-flowering kinds, and I desire to supplement the list. I should be glad, however, in the first instance, to be permitted to make one or two suggestions. I think there are a good many varieties of Chrysanthemums that would come in after Christmas if cultivators only took the trouble to find them out; and I further think the Royal Horticultural Society would be doing good service by inviting growers to send stands of cut blooms to one of their meetings about Christmas. There would not, of course, be great variety at first, but I venture to predict that in a few seasons a very respectable show would be the result. Now what is there in the way to prevent us doing so in the present year? A comparison of sorts could be made at the exhibition, and an accurate report of the kinds exhibited would, I am sure, be of more practical value to cultivators generally than the dreary repetition of names that takes place during the second and third weeks of every November. At all events, it is worth a trial. As a first instalment, then, there must be some general idea of how the work is to be commenced. It is important to know the names of a few varieties to begin with, and also to glean a few hints as to cultivation. I must candidly admit that, as far as my knowledge goes with respect to late-flowering kinds, the object suggested will have to be achieved by growing a goodly number of a few trustworthy varieties, which would be added to every year as cultivators gained experience. I am not writing of a dream; I have personally experienced the utility of what I suggest. Of course it takes time to get a useful collection together. My list, then, would include the following:—Princess Teck, the best late-flowering incurved variety that I know of; Mr. Gladstone, dark red; Ethel, white Japanese; Julia Lagravère, Splendens, Saul, and The Car—the three latter all Japanese. Of the above mentioned the three very best sorts are Princess Teck, Ethel, and Splendens, the latter of which I had in good condition last year up to the beginning of February. Where there is a large conservatory to be kept gay, and a constant supply of cut flowers to be kept up, I would not hesitate to grow a hundred plants of a good showy kind such as Princess Teck, which can be kept quite fresh until Christmas. But although I have named only a few kinds, there are many others that might be added to the list. At present the chief point is for those who have not got proper kinds to secure them at once, and for those who possess them to make the most of them. After being cut down the stools should be kept in a north aspect, in order to keep the cuttings late. March is quite soon enough to propagate them. Plant out as soon as danger from frost is past, and pinch two or three times, to make nice bushes, or, if necessary, let them grow tall. When lifted in the autumn they should be placed in a north aspect, and if properly handled a good show of useful flowers will be the result. *W. Hinds.*

—The value of Princess Teck as a late-flowering variety cannot be over-estimated, and being white greatly enhances its value. Its progeny, Hero of Stoke Newington, is likewise useful for this purpose as a pink, and Grandiflora, a yellow Japanese, is a useful late variety. Fair Maid of Guernsey, although a grand thing, is not so well adapted for late blooming. I have a variety which, in my opinion, beats any with which I am acquainted for this purpose, but

unfortunately I got it without a name, and have never yet been able to ascertain what it is. I may describe it as a reflexed flower, with quilled petals, averaging 2 inches in length, and pure white. This variety is specially adapted for cut bloom, on account of its light appearance. *Virgine* is another kind well worthy a place in every collection as a late bloomer of the *Anemone* type. I think if more attention was given to late *Chrysanthemums* the blooming period could well be extended into the month of February. *E. Morgan, Harrow-on-the-Hill.*

Natural History.

BIRDS AND THEIR HABITS.—I was interested in a communication in the *Gardeners' Chronicle*, at p. 825 of the last volume, in reference to the question whether the blackbird does or does not devour slugs. I think it is very desirable that the habits of the various birds which usually frequent gardens should be generally better understood or ascertained than is the case, the lack of this knowledge being no doubt the cause of unnecessary cruelty being sometimes inflicted upon them. But to return to the question at issue—viz., "Does the blackbird devour slugs?" If it could be proved that he does so, it will no doubt be a feather in his cap, and will go far to cover a multitude of his many transgressions in the garden, such as his well-known propensity to unceremoniously help himself to ripe fruit, such as the Cherry, Gooseberry, Strawberry, &c. In many gardens slugs, as is well known, are a very serious pest. The rook, I have ascertained, will feed upon the small grey slug. But so far as my observation has gone, neither the blackbird, the thrush, nor any other bird I am acquainted with, will touch the large grey or the black slug. Ducks, I have heard it said, will do so, but I never saw them do it; they are certainly far from being particular as to what they swallow, but I have offered them to hungry storks, and to tame seagulls, which have invariably refused them. With snails the case is very different, and the thrush may very frequently be seen using a stone or other convenient object as an anvil, upon which to break their shells. Blackbirds may also do this, although I have never seen them do so; and generally speaking, notwithstanding their delightful song, they are hardly a desirable visitor to the fruit garden, as they are even disinclined to wait until fruit is fairly ripe before they begin to help themselves; and the condition of the weather has even less to do with this matter than might be supposed, the present season being confirmatory of this assertion, as they have already consumed nearly all the ripe haws and Holly berries long before anything like severe weather in any degree lessened their supply of insect food. Prolonged dry weather, however, during the fruit season renders both the blackbird and the thrush exceedingly bold and determined in their attacks upon ripening fruit of nearly all kinds.

THE STARLING is possibly a better friend to the gardener than either of the birds mentioned; he consumes large quantities of insects of various kinds, and if he occasionally helps himself to a little ripe fruit he seldom does very much harm in this respect. The small blue tom tit is generally blamed for removing the buds from fruit trees and Gooseberry bushes, &c., in bullfinch fashion, and on that account not infrequently shares the fate of the latter well-known marauder. But I must say that I have never been able to ascertain that he does so, and I am inclined to think that he is perfectly innocent of this offence, notwithstanding his admittedly suspicious movements on fruit trees and Gooseberry bushes, &c., when he is no doubt diligently searching for minute insect food. Has any one ever found buds in his crop? I never did so, although I have looked for them more than once. One thing, however, it cannot be denied he will do, viz., dig small holes near to the stalks of nearly ripe Peas, which has the effect of making them decay rapidly, but in some measure to atone for this very objectionable practice, he will, if admitted into the greenhouse, in a wonderfully short time, free the plants from aphids, as effectually as a thorough fumigation would do.

THE HOUSE SPARROW is also sometimes blamed for picking the buds from fruit trees, &c.; yet I have never ascertained that he did so. But he is never-

theless a sad rogue in the garden, and like the bullfinch has little mercy shown to him, nor can he be said to deserve more. In town gardens he is possibly more mischievous than he is in country places, and in such gardens it is one of his favourite amusements to pull the blooms of the *Crocus* to pieces apparently with no other object in view than the fun of doing so. A thread, however, stretched along the lines of these plants will effectually prevent him from interfering with them; but the gun is the only thing that will prevent him from destroying crops of early Peas.

THE CHAFFINCH, the greenfinch, and in a less degree, the sweetest of British songsters, the grey linnet, are the most troublesome as regards the destruction of seeds; while the beautiful goldfinch is perfectly harmless, and feeds only upon the seeds of weeds, and his presence is a sure indication of slovenliness in the garden or on the farm. The hawfinch is a shy and somewhat rare bird, but he has a weakness for green Peas, and sometimes makes considerable havoc with the Cherry crop, disregarding that portion of this delicious fruit which is generally appreciated, in order to secure the stone, which he readily breaks with his wonderfully powerful bill, and feasts upon the kernel. How he gets to know that the cherry contains a stone is not so easily explained.

All the small soft-billed birds may be considered as harmless in the garden, and should not be molested, as they do little or no harm; and as the feed almost entirely upon insects, they must necessarily do much good, such as the hedge-sparrow, the wagtail, the wren, the robin, &c. The last-named, it is true, will help himself to a few ripe Currants, to which he is generally welcome enough; and during severe winter weather he has no objection to being imprisoned for days together in a greenhouse, or rather in ainery containing ripe fruit, and where, should there happen to be any uncertainty as to which of the bunches are of the best quality, he will very quickly decide the matter, and that pretty correctly. And on such occasions the blue tom tit does not object to keep his company.

THE OWL is regarded as a bird of ill-omen, and as such is generally destroyed wherever he is found. This is no doubt a great mistake, as in a garden he does no harm, but, on the contrary, much good, feeding as he does in a great measure upon mice, which in most gardens are exceedingly destructive. He is blamed, it is true, for sometimes mistaking a young chicken or a young partridge for a field mouse, but this is not likely to occur often, as he only feeds at night, and chickens and young partridges ought not to be abroad at such times.

THE KITE.—In some parts of the country the common kite is also regarded as a bird of ill-omen, and persecuted accordingly; but he is a shy bird, and does not often frequent gardens, and does no harm when he does so. The black-cap and the white-throat are both troublesome in the Raspberry quarter at the time when the fruit is ripe, but they also destroy great numbers of insects, and the song of the former is remarkably sweet.

THE CUCKOO does good service in the fruit garden, feeding chiefly on caterpillars, and he will speedily clear a plantation of Gooseberry bushes of these troublesome pests, and the wagtails make excellent foster-parents for their young. All the small soft-billed birds will, however, feed the young cuckoo, as there appears to be a sort of fascination in its peculiar cry and open mouth which they cannot resist. It may not be generally known that some kinds of young birds will, under certain circumstances, feed each other, and as an instance of this I may mention that some years ago I observed a young thrush in a large cage. It had been an early hatched bird, and was at the time I am alluding to fully fledged, apparently very healthy and quite tame, and on looking into the cage I observed that it also contained a very wretched looking unfledged bird of the same species. On remonstrating with the owner on what I thought the cruelty of placing this young creature where it was he assured me that the elder bird had taken charge of the younger one, and was feeding and taking every care of it; and to convince me of the assertion he placed a few small pieces of raw meat inside the cage, one of which the elder bird at once seized upon, and after repeatedly striking each piece upon the bottom of the cage, placed all (with the exception of the last piece, which he swallowed himself) in the open mouth of the younger bird, which the latter to all appear-

ance thankfully swallowed. According to a writer in *Nature* some of our small migratory birds are not strong enough to perform the long flight of at least 350 miles across the Mediterranean Sea, but they nevertheless manage to obtain a free passage across, mounted upon the backs of cranes. Late in the autumn, when the weather has become cold, it appears that many flocks of cranes may be seen coming from the north towards the south coast, flying somewhat low, and at the same time uttering a peculiar cry, as if of alarm; and as they do so small birds of various species may be seen flying up to them and settling themselves comfortably upon the backs of the cranes, twittering at the same time their songs of thankfulness. If this statement is correct it presents a wonderful provision of Nature, failing which many species of small birds would inevitably become extinct. *P. Grieve.*

BLACKBIRDS AND THE SLUGS.—I believe, with Mr. Wolley Dod and Mr. Harrison Weir, that blackbirds as a rule do not touch slugs. For four years I have had a pair of blackbirds so tame as to come to the window-sill for food whenever the ground was frozen. They nested in my orchard-house, and would sit on their eggs, or young, without fear, and let me almost touch them. I protected them from cats with wire, and every year they had three broods of five each. This year they had one brood of six, which is, I believe, unusual. I knew them afar from all the other blackbirds (of whom I had sometimes thirty), for the cock had a red beak, and the hen a white head, which was the result of increasing baldness. I could write a long history of their adventures, narrow escapes, firm constancy, and dauntless courage; for although the cock was the smallest blackbird on the place, he allowed no bird of twice his size (not even the pickaxe-beaked starling) to intrude upon his hearth or hunting-grounds. I think that the hen was even tamer than the cock. They would gladly take a worm, not quite from the finger, but tossed to them at a few yards' distance; but they never touched a slug so offered, and they let the slugs in that very sluggy year, 1879, abound around them. They always took their autumn outing (in Bushey Park, most probably), and returned to us before the frost; but I fear their date is over now, for they have not appeared this winter. Again, I had a nest of other blackbirds in a *Deodora*, just over a plant of *Lilium giganteum*. They were decently tame, though not at all to be compared to the others. They used to play round that Lily, but never touched the slugs with which it was infested—large white slugs, as delicate as a native. A great authority on natural history, seeing this state of things, said to me, "Your blackbirds ought to be ashamed of themselves; their very threshold is covered with slugs." Not a worm could take the air without paying for his whistle, but the slugs promenade *passim*. My fowls would seldom catch a slug, but rush about zealously chasing one another for a snail. *A. D. E.*

Apiary.

DEB BOOKS.—It is sufficient to read the criticisms upon recent books on bee culture which have appeared in these pages to understand that many of the objections offered to books on gardening are true of bee books. The book which shall show the unlearned apiarian how to lead from the straw skeps up to the complicated but doubtless most profitable beehive seems still to be wanting, and until this is provided in a cheap form, and brought within reach of the poorest bee-keeper, I fear little will be done to make apiculture universally popular. Writers upon improved systems of bee-keeping seem, as a rule, to proceed upon the assumption that their readers are already to some extent versed in the higher branches of bee-keeping. This is the very class of readers who want least of all to be taught, because the groundwork they already possess, combined with education, enables them to acquire through experience most valuable knowledge. The poor untutored bee-keeper, who has kept bees in straw skeps all his life, and yet with few variations proceeds in his work almost as his father did before him, is not only incapable of appreciating the teachings found in an advanced book, but he has prejudices to overcome, and the only hope of influencing him in a better direction is to make the steps from crude to perfect hives as simple and as attractive as possible. Profit is an element in bee-keeping that exercises a potent influence. If it can be shown that the newer way is the more profitable, very much is done to en-

CORN.

At Mark Lane on Monday 11, per quarter advance was established on home-grown Wheat, American red winter Wheats and Calcutta were *bid.* dearer. Other foreign supported previous value steadily. Flour was not quotably altered, but good medium grades tended against buyers. Malting Barley sold 1s. dearer, and in some cases a larger rise was obtained. Grinding sorts were dull of sale on the spot, but there was a moderate inquiry for arrival. Beans and Peas were unaltered. Maize was firmly held. Oats met a quiet sale at last Friday's rates, except low new, which were rather easier.—On Wednesday the prices of English Wheat were steady, but foreign steady rates were obtained. Flour was without alteration. Malting Barley was firm, but grinding sorts dull. Maize sold slowly on the stands at 3s. to 3os. 3d. for flat corn, and 3os. to 3s. for round. Oats met a limited demand at previous value.—Average prices of corn for the week ending Dec. 31, 1881.—Wheat, 44s. 3d.; Barley, 31s. 6d.; Oats, 20s. 4d. For the corresponding period in the preceding year:—Wheat, 41s. 11d.; Barley, 31s. 5d.; Oats, 20s. 10d.

CATTLE.

At Copenhagen Fields on Monday the beast supplies offered a fair assortment, and sales progressed with a moderate demand. Sheep cleared off pretty well, but the extreme quotations of Monday last were hardly supported. Calves were unaltered in value. Quotations:—Beasts, 4s. 4d. to 4s. 8d., and 5s. 2d. to 6s. 2d.; sheep, 5s. to 5s. 10d., and 6s. 3d. to 7s. 2d.; calves, 4s. 4d. to 6s.—On Thursday trade was quiet, and prices favoured buyers. Beasts were decidedly easier to sell, and sheep barely maintained Monday's prices. Calves were scarce and dear, and pigs were steady.

HAY.

At Tuesday's Whitechapel Market fair supplies were on sale, and a quiet trade at the following quotations:—Prime Clover, 12os. to 137s.; inferior, 75s. to 95s.; prime meadow hay, 115s. to 126s.; inferior, 55s. to 90s.; and straw, 30s. to 51s. per load.—On Thursday a moderate supply of fodder was on sale. The trade was dull at the following prices:—Prime Clover, 12os. to 137s.; inferior, 60s. to 95s.; prime meadow hay, 100s. to 120s.; inferior, 50s. to 90s.; and straw, 30s. to 51s. per load.—Cumberland Market quotations:—Superior meadow hay, 12os. to 132s.; inferior, 84s. to 108s.; superior Clover, 128s. to 135s.; inferior, 90s. to 110s.; and straw, 50s. to 55s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that full supplies are on offer, and the stocks large; trade slow, at the following prices:—Kent Regents, 60s. to 100s.; ditto Champions, 70s. to 80s.; Essex ditto, 60s.; Scotch Regents, 80s. to 90s.; ditto Victors, 100s. per ton, German reds, 3s. 6d. to 4s. 6d. per bag.

COALS.

The following are the quotations current at market during the week:—Ravensworth West Hartley, 14s. 3d.; Walls End—Hetton, 17s.; Hetton Lyons, 15s. 6d.; Lambton, 16s. 6d.; Original Hartlepool, 17s.; Wear, 13s. 6d.; Chilton Tees, 18s.; Thornaby, 15s. 6d.; Haslewell, 17s.; Hawthorn, 15s. 6d.; South Hetton, 17s.; Tunstall, 15s. 6d.

Government Stock.—Consols closed, on Tuesday, at 99½ to 99¼ for both delivery and account. On Wednesday the closing prices were as on Tuesday for delivery, and 99½ to 100¼ for the account. Thursday's final quotations were, for delivery, 99¼ to 99½, and 100 to 100½ for the account. The above are all *ex div.*

WEBBS' SPRING CATALOGUE For 1882.

USED FOR OVER FORTY YEARS THROUGHOUT THE UNITED KINGDOM AND THE BRITISH COLONIES.

THE KOSSOLIAN SALT OR BLOOD SALT,

FOR HORSES, COWS, OXEN, SHEEP AND CALVES.

Its saline and ferruginous elements prevent languor, exhaustion, want of energy, and loss of appetite. All animals should have an ounce or two of the

KOSSOLIAN OR BLOOD SALT

mixed with their food once or twice a week, from the hunter down to the carriage horse and hack. All young animals, whether colt, calf, or lamb, should have half an ounce of the

KOSSOLIAN OR BLOOD SALT

mixed with their food, for it is a safeguard against contagious diseases, and it is destructive to the parasites in the bronchial tubes, causing that distressing malady the Hoarse or Husk. It converts the food, while in the stomach, rapidly into flesh and bone making elements, and gives a firmness to the flesh to resist all poisonous effluvia; and it also renders all animals capable of enduring with safety the heat of summer, and the cold rains and sleet of winter.

Sold in Boxes, containing one dozen packets, price 12s.

DAY, SON & HEWITT,

ESTABLISHED 1834.

SALAP MISREE PERSIANA,

OR

PERSIAN FOOD FOR INFANTS, INVALIDS, AND CONVALESCENTS (REGISTERED).

It is Highly Nutritious. Its Nutrient and Strengthening Properties are in a Condensed or Concentrated Form. It is most easy of Digestion. Is alike agreeable to young or old. Is a Non-irritating Tonic.

FOR LADIES NURSING this preparation is most acceptable, as it not only enables the patient to take a sufficient amount of nourishment without overloading the Stomach—which under the circumstances is naturally irritable, thereby SUPERSEDING the ordinary gruel diet, so very distasteful to many—but it supplies in a high degree all the necessary ingredients for REARING the YOUNG. In derangements of the Stomach, so common to INFANTS, especially in cases of Diarrhoea, it will be found INVALUABLE. Those who suffer from Dyspepsia, and its many ills, will hail it as a boon. It is recommended by many of the most eminent Members of the Medical Profession.

Opinion of the late W. B. O'SHAUGHNESSY, M.D., F.R.S., &c., Bengal Medical Service, late Professor of Chemistry and Materia Medica in the Medical College, Calcutta, E.I.

"Two Drachms afford a sufficient meal for an Invalid. Good Salap Misree, carefully prepared, is in truth one of the Best Articles of diet a Convalescent can use."

TESTIMONIAL.

"GENTLEMEN,—For years I was a victim to the quackery of pills and patent medicines, but now I have renounced them all, and with good reason too. As soon as I found that your Salap Misree was not only a health restorer but a succulent and pleasant food, I threw physic to the dogs; and now I am a hale, hearty, happy man.—Truly yours,

"J. T. GORDON,

"To Messrs. FERRIS & Co."

TESTIMONIAL.

"I can heartily recommend your Salap Misree to those who, as I did myself, suffer from Indigestion and its accompanying horrors. The food is easily prepared, is pleasant to the taste, and is an excellent stomachic. I intend never to be without a supply of it in my family. —I am, your obedient servant,

"JAMES H. WILSON,

"To Messrs. FERRIS & Co."

TESTIMONIAL.

"GENTLEMEN.—I am bound to tender you my best hearty thanks for the very substantial benefits I have derived from the use of Salap Misree. For some years my food would not properly assimilate, and as a last resource I tried your Persian Food. Now my stomach is strong, and the result is that I am in sound bodily health and in good spirits.—Faithfully yours,

"THOMAS FORDHAM,

"To Messrs. FERRIS & Co."

Sold in Bottles, 2s., 3s. 6d., and 10s. 6d. Directions on each.

TO BE HAD OF ALL WHOLESALE CHEMISTS, MEDICINE VENDORS AND STORES.

Independent Slow Combustion Boiler for Small Greenhouses.

TO HEAT BY HOT WATER; REQUIRING NO BRICKWORK.

Specially adapted for small greenhouses; for quick heating or slow combustion. Quite portable, and will heat properly for twelve hours. Made with strong wrought-iron cylinder set in a cast-iron base, with fire-bars and sliding door. Only one-tenth the cost of heating by gas, and much more effectual. Fitted with two 2-in. cast sockets, door for feeding, and socket for smoke-flue.

Cash Prices—Carriage paid.

of Boiler complete, as shown in illustration, but exclusive of piping:—

Size.	Total Height.	Diameter.	To heat 4-in. Piping.	Price.
1	27 in.	16 in.	40 ft.	£3 10 0
2	30 in.	16 in.	60 ft.	4 0 0
3	33 in.	16 in.	80 ft.	4 10 0
4	36 in.	16 in.	100 ft.	5 0 0

Plain Saddle Boiler.

Plain Saddle Boilers are generally used for heating from 100 feet to 300 feet of 4-in. piping; above that quantity it is more economical to use our Check-end Boiler, as one of these, 3 feet long, will heat double the quantity of piping a 3-foot Plain Saddle will.

Size of Sockets.	Size of Boiler inside arch.			Heating Power for 4-in. Piping.	Price on application.
	Length.	Width.	Height.		
Fitted with three 2-in. Sockets.	18 in.	12 in.	10 in.	100 ft.	
	21 in.	12 in.	10 in.	125 ft.	
	24 in.	12 in.	12 in.	150 ft.	
	27 in.	14 in.	14 in.	200 ft.	
	30 in.	14 in.	14 in.	250 ft.	
	36 in.	16 in.	16 in.	300 ft.	

The Perfect Throttle Valve.

2-in.	12s. 6d.
3-in.	12s. 6d.
4-in.	15s. 0d.

Screw Valves Tight under any Pressure.

2-in.	15s. 0d.
3-in.	20s. 0d.
4-in.	25s. 0d.

The whole of the working parts of these valves can be removed without disturbing or cutting the pipes.

Patent Check-end Saddle Boiler.

Check-end Saddle Boiler, simple and durable.

No.	Outside Length.	Outside Width.	Outside Height.	Cross Tubes.	Heating Power for 4-in Piping.	Price of Boiler only.
1	30 in.	20 in.	18 in.	1	300 ft.	£3 10 0

Portable Plant Frames. R. HALLIDAY and CO. desire to draw special attention to their Plant Frames, of which they always have a large stock, ready glazed and painted. They are made of the best materials, and can be put together and taken apart in a few minutes by any one. Prices, delivered to any station in England, also Dublin and Belfast.— L. S. D. 4 feet long, 4 feet wide ... 2 15 0 12 feet long, 4 feet wide ... 4 15 0 6 feet long, 3 feet wide ... 3 15 0 2 feet long, 3 feet wide ... 6 10 0 The glass is nailed and putted in. Lights and framing for brick pits at proportionately low prices. R. HALLIDAY and CO., Hothouse Builders and Engineers, Royal Horticultural Works, Midleton, Manchester.

THE COTTAGE POULTRY HOUSE, TENANTS' FUTURE. Of improved construction, can be erected in a few minutes, with Roosting House, Covered Run, Nests, Perches, &c., complete, 12 feet long, 4 feet wide. Price £6 10s. carriage paid. Write for Illustrated Catalogue, containing useful Treatise on Poultry Management, free by post. BOULTON and PAUL, Manufacturers, Norwich.

GLASS HOUSES & HEATING. BAWWATER HOUSE. HIGHGATE ROAD, LONDON, N.W.

No Greenhouse Perfect without TEEB'S UNIVERSAL FUMIGATOR.—Will last for years, and is fast superseding all other apparatus or contrivance for the purpose. Price 3s. 4d. 6d.; large size, 7s. 6d. each; packing cases.

The Best System of Heating is by Hot Water. The Best Hot-Water Joint is Jones' Expansion Joint. JONES & ATWOOD, ENGINEERS & IRONFOUNDERS STOURBRIDGE.

THE BEST EXPANSION JOINT. MEDAL AWARDED, Horticultural Show, Aston, 1875. DURABLE, NEAT, CHEAP. JONES & ATWOOD'S PATENT HOT WATER JOINT.

ILLUSTRATED CATALOGUE, also Estimates for Heating with the most improved BOILERS, EXPANSION JOINT PIPES, or COILS, on application.

PIPES and FITTINGS, FOR HEATING APPARATUS.

The largest stock to the Kingdom, 4-inch pipes, 1s. 6d. per yard. SILVESTER & SAUNSBURY, Castle Hill Foundry, Newcastle, Staffordshire.

JONES' PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L" SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Table with 5 columns: Hight, Wide, Long, To heat of 4-in. Pipe, Price. Rows include sizes like 20 in. x 15 in., 24 in. x 18 in., etc.

Larger sizes if required. From Mr. CHARLES YOUNG, Nurseries, Baltham Hill, S.W., May 29, 1875. "Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, as without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers in a hour."

PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Boilers of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application. J. JONES and SONS, Iron Merchants, 6, Barkside, Southwark, London, S. E. When ordering Boilers please refer to the above advertisement.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "crown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER and CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES" PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price Lists free by Post. The Trade supplied. ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 2s. per square yard upwards. Pattern Sheet of Plain or more elaborate Designs, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Cement, &c. F. ROSHER and CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pitts to any Railway Stations. Samples of Sand free by post. FLINTS and BRICK BURRS for Rockeries or Ferneries. KENT FEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER and CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal discount to the Trade.

Geometrical Mosaic and Encaustic. TILE PAVEMENTS, for Conservatories, Verandahs, Entrance Halls, &c. Enamelled and Decorated Glazed Tiles, for Wall Linings, Fireplaces, &c.; also Patent Indestructible Terra-cotta Plant Markers. Patterns and Prices sent post-free on application. MAW and CO., Beuthall Works, Broseley, Shropshire.

KING'S ROAD, CHELSEA, S.W.

"EARLIEST OF ALL" PEA

(LANTON).

Quite New—Dwarf. Price, 3s. 6d. sealed half-pint.

Opinions of Eminent Authorities:—

Mr. BARRON, *Royal Horticultural Gardens, Chiswick*, writes:—"When I had the pleasure of visiting your Seed Farm last summer I was very highly pleased with the appearance of a Pea which very appropriately bore the name of Earliest of All, and it was not only early but a great cropper, the pods of good size, fine colour, and the quality, when cooked, really excellent. It seems to me that this will prove to be a very valuable and useful early Pea."

Mr. SHURLEY HUBBERD writes:—"When visiting your Seed Farm in the past summer, I had an opportunity of seeing the Earliest of All Pea as a field crop and also as a table vegetable. In the latter case the pleasure of seeing was supplemented by the delight of tasting; and surely I have never met with such high table quality in a first early Pea. It is just the kind of thing we want, as hitherto our first early Peas have been notoriously wanting in quality."

Mr. GIBBERT, *of Rushey*, writes:—"The earliest of all my Peas sown outside is the blue round early from you. Day's Sunrise is simply nowhere."

Mr. J. MOSE, *The Gardens, Maryam Park, Titchase, South Wales*, writes:—"It is the earliest Pea we have ever been able to grow. It grows very fast, is quite distinct, and more prolific than Dwarf Peas generally are. The pods fall remarkably quick and well, and I feel certain it is a Pea that will be extensively grown as the earliest and best of all Peas. It is superior to William I, and this is saying a great deal."

Mr. DOUGLAS, *of Loxford Hall*, says:—"I think Earliest of All is an excellent early Pea. Growing side by side with William I, it is quite as fruitful as that variety—rather earlier, and has the advantage of producing eight Peas in a pod—a number I have not yet counted in any Pea so early as this."

Mr. W. LITTLE, *Marston Gardens, Frome*, writes:—"I consider your New First Early Pea the best early. It is at least ten days earlier, and of better quality than William I, and is a good bearer. It is likely to become a popular variety, and ought to make its mark."

Mr. R. DRAFER, *The Gardens, Seaham Hall, Sunderland*, writes:—"The early Pea you sent me for trial I found the earliest by six days than several others I grew side by side, including Dickson's First and Best, William I, and Little Gem. It is also a good cropper, and has fur-cusured pods. It will stand in the front rank of early Peas."

Mr. W. VALES, *The Gardens, Neatham Hall, Wakefield*, says:—"It is the earliest I have grown by ten days, and I recommend every one to grow it."

AUCTION ROOMS and OFFICES, 38, KING STREET, COVENT GARDEN LONDON, W.C.

OUR PRIMULAS.

Awarded First-class Certificates and Extra First Prizes at Floral Committee of the Royal Horticultural Society, Birmingham, Liverpool, Manchester, Royal Aquarium, Southampton, Torquay, Richmond, and Alexandra Palace.

SWANLEY PURPLE, 2s. 6d. per packet.

SWANLEY RED, 2s. 6d. per packet.

The Horticultural Journals speak of them thus:—

"Gardeners' Chronicle," November 12, 1881.
 "Floral Committee of Royal Horticultural Society.—Many as have been the floricultural triumphs of Messrs. Cannell, none will probably bring them more renown than the collection of Primulas which to-day came from the 'Home for Flowers,' splendidly grown and flowered, and of well selected varieties; it was a group that gained the admiration of all, and higher praise could hardly be gained. Most strikingly distinct and most attractive of all was a real Primula—the Swanley Red—that took the popular fancy amazingly, and of which it may be said that it has no rival. Other sorts of unshaded quality were the Swanley White, Rubra Improved, Swanley Purple, and Swanley Carminata—all represented by a number of plants, each in a 4-inch pot, in all respects remarkable for their stout leathery leaves and robust trusses of beautiful flowers thrown sufficiently above the foliage to show every pip to the best advantage."

From "Manchester Guardian," November 23, 1881.
 "Report of Chrysanthemum Show.—Messrs. Cannell also illustrate the latest floricultural achievements in deepening the colour and augmenting the general beauty of flowers, and were awarded a First class Certificate."

"Gardeners' Magazine," February 12, 1881.
 "A First-class Certificate was awarded to Messrs. Cannell, Swanley, for Primula sinensis Dr. Denny, a very fine single variety, of excellent habit, and bearing very large flowers of a bright sanguineous crimson colour."

"The Garden," November 19, 1881.
 "Messrs. Cannell & Sons showed at South Kensington, before the Floral Committee, several dozens of Primulas in the highest state of perfection. Swanley White is an excellent pure white. Amongst them was a delicate flesh, 'Delicata' and 'Lilacina,' deep pink and black; another a deep salmon suffused with lake. All these were of good form and substance, measuring 2 inches in diameter."

"Journal of Horticulture," December 1, 1881.
 Birmingham Chrysanthemum Show, November 23 and 24, 1881.—"Large and handsome collections of Primulas were staged by Messrs. H. Cannell & Sons, Swanley, the white-and-red Primulas being greatly admired; the rich colour of Swanley Red was indeed remarkable."

"Gardeners' Magazine," January 15, 1881.
 "Messrs. H. Cannell had a most interesting collection of Primula sinensis, for which they were awarded the Silver Bankers' Medal."

Mr. J. Douglas, Loxford, Ilford, November 1, 1881.
 "Your Chinese Primulas are very fine. You have the best and most varied strain I have yet seen. Your houses must be a grand sight."

"The Garden," November 19, 1881, says:—
 "Messrs. Cannell & Sons' Primulas, new red, or reddish-crimson flowers are the greatest acquisition we have seen for many years. Equally important is Swanley Purple, deep purple; but these, like the Swanley Red, are large in size and good form."

H. CANNELL & SONS, The Home for Flowers, SWANLEY, KENT.

FOR THE GARDEN AND FARM,

Is now ready, and may be had free on application.

THE ROYAL NURSERIES, SLOUGH.

SINGLE DAHLIA SEED.

JOHN CATTELL

Has great pleasure in announcing that he has this season harvested a fine lot of Single Dahlia Seed, saved from upwards of fifty varieties of shades and colours. The demand for these popular flowers is sure to be very great this year. Early orders are respectfully solicited.

Price, per packet, 1s. and 2s. 6d., post-free. Trade price on application.

NURSERY and SEED ESTABLISHMENT, WESTERHAM, KENT.

J. CHEAL AND SONS' NEW SEED CATALOGUE and CULTURAL GUIDE for 1882.

Fifty-four pages, one hundred illustrations, and beautiful coloured Plate of three NEW MELONS, post-free for seven stamps.

Descriptive LIST of NOVELTIES post-free.

CRAWLEY, SUSSEX.

GEO. JACKMAN & SON, (ESTABLISHED 1810.)

Cultivators of FRUIT and FOREST TREES, Evergreen and Flowering TREES and SHRUBS, ROSES, RHODODENDRONS, Conifers and Hardy Climbers.

HOWDEN and COMPANY, INVERNESS NURSERIES, N.B.

FLOWER SEED NOVELTIES
For 1882.

- Williams' Little Gem Capsicum . . . 1 6
A winter decorative plant of great merit, very effective in any situation where a bright colour is required. It produces a profusion of scarlet coloured, Cuneate-shaped berries, which rise prominently above the foliage. Awarded a First-class Certificate of Merit.
- Williams' Primula sinensis fimbriata "Meteor" 5 0
A new variety, of compact habit; the best stalks have a reddish tinge, with leaves deeply cut and of a dark green hue. The blooms are well delineated, of medium size, good form and substance, with colour of an intense rich crimson, relieved by a bright yellow eye. Awarded two First-class Certificates of Merit.
- Williams' Primula sinensis fimbriata alba "magnifica" . . . 5 0
- Williams' Primula sinensis fimbriata "Chiswick Red" . . . 5 0
- Williams' Primula sinensis fimbriata "rubro-Vioacea" . . . 5 0
- Williams' Primula sinensis fimbriata "cocinea" . . . 5 0
- Williams' Calceolaria, superb strain, . . . 5 0
- Williams' Cineraria, extra choice, . . . 5 0
- Williams' Prize Cockscomb . . . 2 6
Finest strain in cultivation. Awarded, last autumn, a First Prize at the Grand International Horticultural Exhibition, held in the Royal Botanic Gardens, Manchester.
- Williams' Cyclamen persicum "Brilliant" 5 0
25. 6d., 35. 6d., and
- Williams' Cyclamen persicum "giganteum" 5 0
25. 6d., 35. 6d., and
- Williams' Cyclamen persicum giganteum rubrum" . . . 5 0
25. 6d., 35. 6d., and
- Williams' Single Dahlia . . . 1 6
Carefully saved from one of the best collections in the country.
- Williams' Gloxinia, finest mixed . . . 1 6
- Williams' Fyretorium aureum selaginoides . . . 1 6

VEGETABLE SEED NOVELTIES
For 1882.

- Williams' "Newton Court" Melon . . . 2 6
A green-fleshed seedling of hardy constitution and very fine flavour. Highly commended.
- Williams' "Semper Fidelis" Melon . . . 2 6
A scarlet-fleshed seedling, very handsome, remarkably juicy, and profusely flavoured.
- Williams' Holloway Rival Pea . . . per 1/2 pint 2 6
An early wrinkled variety of great merit, about 2 1/2 feet high, first-rate cropper, and very prolific.
- Williams' Prolific Dwarf French Bean per quart 2 6
- Williams' Alexandria Broccoli . . . per pkt. 1 6
- Williams' Improved Dwarf Brussels Sprouts . . . 1 0
- Williams' Early Nonsuch Cabbage . . . 1 0
- Williams' Matchless Red Celery . . . 1 0
- Williams' Matchless White Celery . . . 1 0
- Williams' Gloria Mundi Endive . . . 1 0
- Williams' Victoria Cos Lettuce . . . 1 0
- Williams' Magnum Bonum Onion . . . 1 6
- Williams' Emperor of the Marrow Pea per quart 2 6

Illustrated Seed Catalogue for 1882

Now published, and can be had, post-free, on application.

All orders are executed, with the greatest promptitude, from seeds of unsurpassed excellence; those amounting to one, in value and upwards are forward-d carriage paid to any railway station in England or Wales, and all orders of 40s. or more in value to any railway station in Scotland, or steam-shiping post in Ireland.

Flower Seeds, excepting heavy kinds, Post-free.

FOR H.R.H. THE PRINCE OF WALES.

J. WEEKS & CO. have the honour to announce that, in addition to many other places of distinction, they have supplied and fixed two of their new HYDRO-CALORIC COILS in the Grand Saloon, Sandringham. It is not too much to say, that these Hydro-Caloric Coils are constructed upon the best known laws of Hygiene, and combine the most perfect system of Warming and Ventilating in one operation. They are invaluable for the healthful comfort of Mansions and Public Buildings. The constant stream of fresh warm air which they introduce, without draughts, has a very salutary effect upon all kinds of plants, and renders them a valuable health-giving adjunct in Orchard, Fruit, Plant, and Forcing Houses.

For Particulars and New CATALOGUE of

CONSERVATORIES, HOTHOUSES, AND HOT-WATER APPARATUS,

Address:—J. WEEKS & CO., HORTICULTURAL, WARMING, and VENTILATING ENGINEERS, KING'S ROAD, CHELSEA, LONDON, S.W.

STERLING
Carters'
NOVELTIES.

Pronounced by the Royal Horticultural Society and other acknowledged Authorities to be

THE BEST FOR EXHIBITION OR TABLE.

NEW ONION—Carters' Golden Queen.—A perfect specimen of an Onion. Skin a delicate straw colour. Price, in sealed packets, 12. 6d. and 25. 6d.

NEW ONION—Carters' Silver Ball.—A very distinct silver-kinned Tripoli Onion. The Royal Horticultural Society pronounce it "very handsome". Price, in sealed packets, 12. 6d. and 25. 6d.

NEW ONION—Carters' Golden Globe.—A splendid exhibition variety. A transparent golden-straw colour. Price, in sealed packets, 12. 6d. and 25. 6d.

NEW PEA—Carters' Telephone.—Awarded a First-class Certificate by the Royal Horticultural Society. A splendid exhibition variety. Price, in sealed packets, 25. 6d. per half-pint.

NEW PEA—Carters' Stratagem.—The only Pea Certificates by the Royal Horticultural Society in 1879. Price, in sealed packets, 35. per pint.

NEW PEA—Carters' Pride of the Market.—A superb new Dwarf Pea for Garden or Field Crops. Price, in sealed packets, 35. per pint.

NEW PEA—Culverwell's Telegraph.—An indispensable exhibition variety. Price, in sealed packets, 25. 6d. per pint.

NEW BEAN—Carters' Leviathan takes First Prize everywhere, producing enormous Pods, 13 to 15 inches long. Price, in sealed packets, 25. 6d. per pint.

NEW BEAN (Dwarf)—Carters' Longsword.—A remarkably productive and fine-flavoured variety. Price, in sealed packets, 25. 6d. per pint.

NEW BEAN—Monster Negro.—Awarded First-class Certificate Royal Horticultural Society, 1879. Price, in sealed packets, 25. 6d. per pint.

NEW TOMATO—Carters' Dedham Favorite.—Awarded a First-class Certificate Royal Horticultural Society, 1881. Price, in sealed packets, 25. 6d. per packet.

NEW MELON—Blenheim Orange.—Awarded 1st Prize, beating Thirty-one Varieties at the June Show of the Royal Horticultural Society; also awarded the First-class Certificate of the Royal Agricultural Society, Sept., 1880. Price, in sealed packets, 12. 6d., 25. 6d., and 35. 6d. per packet.

NEW CAULIFLOWER—Carters' De-Rance.—Extra Early Forcing, the best Early Cauliflower in cultivation. Price, in sealed packets, 12. 6d. and 25. 6d. per packet.

For full particulars of valuable Money Prizes offered by James Carter & Co., in 1882, for many of these Novelties, see the Schedule of the Royal Horticultural Society, or

CARTERS' Illustrated VADE MECUM for 1882.

THE

Gardeners' Chronicle.

SATURDAY, JANUARY 14, 1882.

THE BEST NOVELTIES OF 1881.

(Continued from p. 10.)

STOVE PLANTS.

THESE naturally divide into two sub-groups, commonly distinguished by the terms flowering and flowerless plants, using the words in their gardening sense. We shall take the former first, and it will afford, as we shall see, several subjects of interest, though nothing very startling. The most sensational plant is, no doubt, Mr. Bull's Tacarum Warmingianum (*Gard. Chron.* xvi. 654, fig. 134), which, perhaps, unites the two groups we have alluded to by representing now one, now the other of them. In its flowering stage, however, it is obviously a flowering plant, and from this point of view is remarkable for its large spathe, which is 15 inches long, convolute at the base, revolute at the tip, and of a light coppery-brown, the upper part of the spadix covered with pinkish male flowers. When not in bloom it forms a grand foliage plant, the tuberous root producing a solitary leaf, elevated on a petiole which is light green marked with white lines, and which reaches 3-4 feet in height; the blade is 2-2½ feet across, three-parted, each division being bipinnatifid, and its ultimate lobes lanceolate-oblong, falcate, and connected with each other by a broad, well-marked wing. This grand Arad was imported by Mr. Bull from Minas Geraes, in Brazil, where it was first discovered by Dr. Warming, after whom it is named. Another plant of the same character is the *Dracontium Carderi*, which has the solitary three-branched bipinnatifid leaf, 2 feet across, elevated on a mottled green and brown petiole 2-3 feet high, and the spathe after a foot long, green outside, dull purple within. The Bornean *Jasminum gracillimum* (*Gard. Chron.* xv. 9, fig. 2), a white fragrant climber of a very ornamental character, proves to be especially valuable as a winter blooming plant. Another interesting acquisition, and likely also to have a special value on account of its winter blooming habit, is the *Begonia socotrana*, a tuberous species from Socotra, with orbicular petate leaves, and bright rose-pink flowers disposed in lax cymes (*Gard. Chron.* xv. 8). *Euadenia emines*, from West Tropical Africa, is a singular half shrubby Capparid, with trifoliate leaves, and large terminal racemes of curious pale yellow flowers, in which the two upper petals of each flower are longer—nearly 4 inches—and of a spatulate form. *Lysionotus serrata*, an Indian Gesneraceous plant, is a pretty addition to stove plants; it is of erect habit, has fleshy stems 1-2 feet high, rather large elliptic lanceolate leaves, with a glossy upper surface, and axillary corymbs of funnel-shaped oblique-mouthed pale lilac-blue flowers, marked with darker blue veins. *Osbeckia rostrata* is another Indian (Bengal) soft-stemmed shrub, with four-cornered stems, large elliptic ribbed leaves, and terminal cymes of large bright mauve-purple flowers. One or two additions have been made to the Amarylhidaceous genus *Crinum*, namely, *Crinum Forbesianum*, from Delagoa Bay—a noble plant, with a large fleshy bulb, ciliate lorate leaves, which appear before the flowers, and

many-flowered umbels of white blossoms flushed and striped with bright rose-red; and *Crimm Balfourii*, from Socotra, another interesting species, with many-flowered umbels of shortly-stalked fragrant white flowers. *Ixora Westii*, with bright pink flowers, darkest in the tube, and *Ixora Pilgrimii*, with orange-scarlet flowers, shaded with crimson, are good acquisitions. To the foregoing we must add two or three Bromeliaceæ; one, called *Neumannia nigra*, is of caulescent habit, with long-stalked elliptic recurved leaves, and a cylindrical spike of crimson bracts, from which purple-black flowers, $2\frac{1}{2}$ inches long, protrude; the inflorescence rather recalls that of a *Curcuma*. The *Chevalliera Germinyana* is a very fine plant, with broad spreading leaves, and a dense spike of dark crimson bracts from which the white flowers scarcely emerge. Less striking, but not less graceful, is the Brazilian *Bilbergia Lietzelii*, a pretty plant in the way of *B. nutans*, with lorate spinulose leaves, scarlet bracts, and long green flowers tipped with blue; of this there is also a double-flowered variety. The interesting *Tillandsia argentea* of gardens is, according to Professor Morren, a species of *Anoplophytum*, which he calls *A. incanum*.

Of the group designated "foliage" plants—that is to say, those in which the flowers are not the primary consideration—precedence must be given to some of the magnificent Pitcher-plants of Borneo, especially *Nepenthes Rajah* (*Gard. Chron.* xvi. 493, fig. 91), and *Nepenthes Northiana* (*Gard. Chron.* xvi. 717, fig. 144, et supp.). *Nepenthes Rajah* has broad, purplish-crimson pitchers, 6 inches across, and more than a foot long, the large lid spurred at the base, and the broad rim of the purplish orifice closely ribbed. *Nepenthes Northiana* is equally grand, the full-grown native pitchers being cylindrical, greenish-red, purple-spotted, 12 to 16 inches in length, the mouth surrounded by an everted part, the frill 2 inches broad. Other Pitcher-plants have come to the front, and added greatly to the interest attaching to these wonderful plants. Thus we have the true *Nepenthes Veitchii* (*Gard. Chron.* xvi. 751, fig. 152), from Borneo, with cylindrical pitchers, having sharply lacerated wings in front, and a very broad creamy-olive or reddish everted plated border surrounding its mouth. *Nepenthes madagascariensis* (*Gard. Chron.* xvi. 685, fig. 139) is quite a novelty, its small flask-shaped pitchers being crimson, the mouth circular, contracted, the throat cream coloured, and the small lid spurred at the back. *Nepenthes Masteriana* (*Gard. Chron.* xvi. 749, fig. 148), raised at the Royal Exotic Nursery, Chelsea, between sanguinea and khasyana (the distillatoria of gardens), is one of many pretty hybrids now in cultivation; it has claret-red cylindrical pitchers. *Nepenthes Courtii* (*Gard. Chron.* xvi. 845, fig. 160) is also a very beautiful hybrid, with green pitchers, spotted with red, a cross between *Dominii* (itself a cross out of *Rafflesiana*) and an undetermined Bornean species suspected to be *N. lanata*; this is remarkable for its sharply lacinate wings. *Nepenthes Henryana*, a handsome hybrid between *Hookeri* and *Sedeni*, has the pitchers green, heavily blotched with reddish-purple, the mouth crimson, and the lid suffused with rosy-lake. *Nepenthes superba*, also a cross between *Hookeri* and *Sedeni*, is a plant of very similar character. Of another class is the *Dracena Lindenii*, an exceedingly elegant addition to this highly decorative group, and which has an erect stem and elegantly recurved lanceolate green leaves, longitudinally striped with creamy-yellow. Amongst the so-called *Crotons* (more correctly *Codiaeum*) one of the most effective is *Croton Thomsonii*, a variety with obsoletely lobed leaves 1 foot long and 4 inches broad, deep green, the midrib and veins strongly marked with bright yellow. *Croton Laingii* is also a distinct and pretty form, with narrow, drooping, slightly twisted leaves, dark green in their upper half, the remaining portion yellow, and the stem and petioles tinged with red. The genus *Dieffenbachia* has received important accessions in *Dieffenbachia triumphans*, a Columbian plant, with the dark green leaves thickly blotched with yellowish-green; and in *Dieffenbachia Imperator*, from the same country, the

latter having the leaves pale olive-green blotched with pale yellow and white. In *Schinmatoglotis Lavallei* we have a rather elegant *Araç*, with slender erect stems, long-petioled lance-oblong acuminate leaves about 6 inches long, green, freely maculated and blotched with silvery-grey. The *Ardisia metallica* from Sumatra seems likely to be a decorative shrubby plant, being clothed with lanceolate-oblong leaves, having the surface shot with a bluish and bronzy metallic lustre; it bears red berries in the leaf axils. *T. Moorei*.

(To be continued.)

New Garden Plants.

PESCATOREA LEHMANNI.

We are now enabled to give an illustration (fig. 5) of a flower of this beautiful novelty, sent to us by M. Vervae, of Ghent. The plant was originally described in these columns by Professor Reichenbach (vol. xiii., p. 424). The broadly ovate acute segments are, within, of a deep violet hue, velvety in texture, and traversed by numerous parallel white lines, corresponding to the principal veins. The lip is smaller than the segments, and paler in colour, with a flat, narrow, deflexed claw, and a three-lobed limb, of which the two side-lobes are bent upwards, forming a deep channel leading up to the column; this channel is strongly ribbed with violet ridges, the intervening furrows being white; the terminal lobe is oblong-lanceolate, concave on the upper surface, which is clothed with rather coarse setæ, strongly revolute at the apex and at the margins. Mr. Worthington Smith calls our attention to the side view of the column and lip as seen in the sketch to the right, and which closely resembles an elephant's jaw, even to the position of the tooth. Prof. Reichenbach, whose keen appreciation of resemblances, and whose ingenuity in devising specific names for Orchids are matters for admiration among his colleagues, would, no doubt, have devised some descriptive designation, were it not that the claims of M. Lehmann were considered paramount.

Since writing the above we have received from Messrs. Sander & Co., of St. Alban's, a letter in which they state that they introduced the plant through M. Lehmann, and were also the first to flower it. They also enclose a flower of the same form as that figured, but much paler and more red in tint, with the white lines broader, and in which the base of the flower-segments, the tip of the column, and the setæ on the lip are nearly white. It is clear that the colour of the plant is variable, and Messrs. Sander's specimen gives rise to the hope that a pure white variety may not be an impossible thing in the future.

MASDEVALLIA TRIANGULARIS, Lindl.

One of the *Masdevallias* of the most ancient nobility, no *parvenu* of our days, one of Mons. J. Linden's discoveries of 1842 or 1843. Ask Director Linden, he will tell you the very day. It is an extraordinary plant, most probably the most florid of all its congeners. Only a few *Pleurothallis* of my knowledge can equal it. I have before me a dense mass of fifty stems with cuneate oblong leaves, less than a span in height, with a great quantity of flowers with unusually delicate colours and numerous buds, which remind me of the heads of long-beaked ibis-like birds. The older stems are covered with the blackish cover so common in numerous *Masdevallias*. The buds have a singular rounded *gottweii* form of their chins. The sepals expand widely, and their oblong-triangular bodies are of light ochre colour, with innumerable light elegant brownish-purple spots, the base of the lateral ones being yellow, free from spots. The small white petals have three teeth at the top, a callus inside in the middle, and a spinoid tooth on their base in front of the purple-brown nail. The white rhombic lip is spotted all over with purple spots, and its opposite part shows two triangular side lacinae and a cuneate oblong fringed small blackish-purple middle lacinae. These latter-mentioned parts are reflexed in a very elegant manner. The column is white with purple anterior angles. This fine plant comes from Venezuela. I never saw it alive before, but now as a

lovely Christmas-box it flowers in profusion before me; having been sent by Mr. Sander. *H. G. Rehb. f.*

PHALANOPSIS STUARTIANA PUNCTATISSIMA.

I propose this name for a fine variety which has numerous small mauve spots on the upper sepal, petals, and upper and inner side of the lateral sepals. Of course it comes from Messrs. Hugh Low & Co. *H. G. Rehb. f.*

COLUMNÆA KALBREYERANA.

This very remarkable stove *Generad* was exhibited by Messrs. Veitch at the Scientific Committee on Tuesday last, and deservedly received the award of a Botanical Certificate. It is indeed something more than a botanical curiosity, having a very striking and ornamental appearance. We have not yet been enabled to look into the botanical history and structure of the plant, but we may here say that it is of shrubby, perhaps half-climbing habit, with rather thick fleshy stems. The leaves are closely set, apparently in two ranks, one on each side of the stem, each 12 or 18 inches in length, by 2 or 3 inches in breadth, oblong acute, oblique at the base, arching downwards, glabrous, dull green on the upper surface, mottled with translucent creamy-orange on the lower surface, and with green veins. The flowers are borne on short racemes proceeding from the stem, and each has a long yellow calyx $1\frac{1}{2}$ –2 inches long, prismatic, angled and pointed at the tip. We hope shortly to give a figure of this extraordinary plant, and to give fuller and more accurate details as to its structure than we are now able to do.

TECOPHILEA CYANOCROCUS.

This charming little *Idraceous* (?) plant was shown by Mr. G. F. Wilson at the meeting of the Royal Horticultural Society on the 10th inst. It is a bulbous plant, with leaves resembling those of *Scilla sibirica*, but more pointed. The flower is borne on a slender leafless stalk 2 or 3 inches in height, the flower itself being about 1 inch in length, funnel shaped, with oblong obovate obtuse segments of a deep cobalt-blue, like that of *Gentiana acialis*, with a few fine white stripes at the base. The plant was introduced from the island of Juan Fernandez by Messrs. Haage & Schmidt, and was figured in the *Gartenflora*, 1872, tab. 718. See also *Gard. Chron.* 1873, p. 1637. It is probably not quite hardy. Mr. Wilson deservedly obtained a First-class Certificate for this little gem, and he would be doing a service by telling our readers the details of its culture. We are informed that it flowered at Kew some years since, but the plant is not mentioned in Mr. Baker's Synopsis of *Idrises*.

LYGODICTYON FORSTERI.*

This is a handsome climbing Fern, which received a First-class Certificate at the hands of the Floral Committee on Tuesday last. It was exhibited by Mr. Kettle, gardener to H. E. Green, Esq., Kingsford Stanway, Colchester, under the name of *Lygodium Futcheri*. For the correct name we are indebted to Mr. Moore. It is a very fine bold looking climbing Fern, native of the South Sea Islands, and which would do admirably as a pillar plant in a warm greenhouse. The pinnate fronds are of firm texture, bright green, varying in form according to age, the segments being lance-shaped from a square base, each on a very short stalk, wavy, and finely-toothed at the margin. The fertile segments are shorter and broader, and bear the small oblong fruit spikes in rows on the margin like so many blunt teeth. It is the *Lygodium reticulatum* of Schkbr., and of *Hooker* and Baker's *Synopsis* (1868), p. 438.

"THE OLD MASTERS."

This exhibition, now open at Burlington House, is quite equal, in our estimation, to any of the similar gatherings of pictures brought together in former years in the rooms of the Royal Academy. Sir Joshua Reynolds, Romney, Morland, Gainsborough, Hogarth, and Wilkie, amongst deceased Masters of the British School, are well represented. The small picture by James Ward, 1, and named "Wind," is a masterly representation of an old albino nag on a very windy day. Passing many portraits and several landscapes of great interest and beauty, we come to a small picture of "A Bull," 20, by Sir Edwin H. Landseer, R.A., an admirable piece of draughtsmanship and colour. In 26 and 27 are notable pictures by George Morland, of "Gipsies in a Woody Landscape," and a

* *Lygodictyon Forsteri*, J. Smith in *Hook. Gen. Fil.* t. iii. 8; and in *Historia Filicum* (1873), p. 352; *Ferns British and Foreign* (1877), p. 259.

portrait group by Hogarth. The famous picture by Wilkie, named "The Card Players," 34, is lent by Mr. J. Walter, M.P. The same gentleman, amongst other pictures, lends 55, "The Marriage Feast at Cana," by Jan Steen, an elaborate picture full of detail, indicative of the close proximity, in the artist's mind, at least, of Cana with Holland. A remarkably good Dutch picture of figures and a wintry landscape is 73, "Skating Scene in Holland," Aart van der Neer. The Earl of Normanton lends 77, "A Young Lion," life size, rolling over on rocky ground, by Rubens, a remarkable and most life-like representation of a lion at play. Amongst several pictures by David Teniers, all in his well-known style, we may direct attention to the curious "Temptation of St. Antony," and amongst the four paintings by Adrian Van Ostade to that of the curious picture of "The Nativity," 91.

In gallery No. 3 are the famous pictures of "Charity" and "Fortitude," by Sir Joshua Reynolds, 129 and 132, both lent by the Earl of Normanton; and the "Immaculate Conception," attributed to Murillo, 135. In this well known composition one of the angelic children is represented with flowers of *Lilium candidum*, each bloom being furnished with five petals only instead of six; it seems strange, that in painting such an important picture, the artist should have been careless on such a point as the proper representation of the White Lily, a plant peculiarly associated with the subject represented: the same oversight was commented on in the case of another picture some time since. It may be a trifling defect, but to a botanist

fifth and last room are the famous pictures 242-3-4, of "Charles I. and his Children," by Stothard, "The Trial of Queen Catherine," by Harlow, and "George, second Earl of Macclesfield," by Hogarth. In 247 there is yet another "Portrait of Lady Hamilton," by Romney, and at 253 "John (but painted on the canvas "Jack"), Viscount Kilmorey," by Gainsborough. In the same room there are two large and magnificent pictures by Morland, a large portrait group by Hogarth, and Wilkie's famous unfinished picture, 255, named "School."

ICE STORING IN SAWDUST.

It is not so well known as it ought to be that sawdust is almost unequalled as a material for preserving ice. It is greatly used for this purpose in ocean-going steamers, and I believe largely also by those who store ice in cellars in towns for the purpose of retailing it to the public. I am not aware that sawdust has been used for preserving ice out-of-doors to any extent, if at all—at least, I have never heard of its being so used. Some experiments we made with it here some years ago were so successful that we now depend entirely upon the sawdust pit for supplies, and have not filled or used the old ice-house since 1876.

The old ice-house is a substantial brick and stone building, of the usual egg-shaped pattern, with double doors, and a passage communicating with the outside, and, like most of its type, it is awkward to fill, besides being rather precarious in the way of furnishing ice late

poles, placed all round the sides, at about 2½ feet apart. The bottom of the pit was laid with a double thickness of wooden slabs for the ice to rest upon, and with a slight slope to one corner, to a small catch-pit, for the purpose of collecting the drainage.

From the catch-pit a drain of 4-inch glazed pipes was conducted to an outlet in a hollow some 20 yards distant. Here I may remark, that in selecting a site for a pit an outlet for the drain not more than 20 yards distant should be secured if possible, in order to avoid the expense of cutting a deep drain to a distant outlet. From my notes, I find the pit was ready by the beginning of January, 1877, and on the 4th and 5th of that month we stored in it about 250 loads in all. There would probably be about 170 loads in the pit to the ground level, and eighty loads above the ground level, sloped up to a point like the top of a hayrick to throw off wet. The whole was covered over with from 20 inches to 2 feet in depth of sawdust.

In spring and early summer, when the ice began to settle and give way a little round the sides, the sawdust was examined once or twice a week, to keep cracks filled up, the space round the sides being made good when necessary from a spare heap of sawdust kept in reserve for the purpose. After furnishing daily supplies from July to November, there remained at the end of December about fifty loads of ice in the pit. For the season of 1878 the pit was filled as before, and after the usual supplies daily, for a large establishment, from July to November, there remained at the close of the year about seventy loads in a solid block. For 1879 the pit was prepared in the same way, with the result that after the season's supply there remained about eighty loads in the pit, in a block, at the close of the season. In 1880 the usual supply was stored, with the result that, after ample supplies during the season, there remained at the end of December, when preparing the pit for the following season's storage, a mass of ice 17 feet by 14 in diameter, and 8 feet in depth. The results for last year (1881) were something similar, for when clearing out the sawdust the other day to make room for storing ice for 1882, there was so little waste round the sides of the ice that the workmen could not get at the sawdust between the ice and the wood lining, except by using narrow hoes to draw it to the corners and the end where the ice had been cut from during the season, and where there was room to work a shovel or spade.

Shortly stated, since the pit was first filled five years ago we have never been without ample supplies of ice for every purpose, and it has never been empty—there never being less than fifty to eighty loads left at the end of the year. These results may be fairly regarded as being highly satisfactory, more especially when the cheapness and convenience of the system is taken into consideration. A pit to hold 200 loads of ice may be made in the way described above for from £20 to £25, according to local circumstances. An ice-house of stone or brick to hold the same amount would probably cost not far short of £200. The situation here is not at all favourable for the preservation of ice; being so close to the sea, there is usually a good deal of moisture in the air, while the climate is, on the whole, equable and mild.

One great advantage of this method of storing in sawdust is that ice can be got at any time, several times a-day if necessary, without fear of waste, it being only necessary each time ice is wanted to uncover as much of the sawdust as will admit of the quantity required being got, then covering up as before.

The principal defect in the common form of ice-house is that every time ice is taken out a volume of warmer air is admitted into the ice-house to act on the whole surface of ice for some time after, wasting a great deal more than is usually taken out. It is no unusual thing for a gentleman to have his ice-house filled, and yet have to deny himself the luxury of ice during the heat of summer, lest by opening the doors too frequently supplies may fall during the shooting season in September and October.

Another cause of waste in ice-houses of brick or stone lies in these materials being but indifferent non-conductors, consequently they conduct a certain amount of the heat of the surrounding soil into the house. Wood is infinitely preferable to brick or stone as an insulator from the heat of the soil, besides being cheaper, and preserving the ice more effectually.

There is no doubt the larger the body of ice stored the greater the certainty of successful keeping; thus, 100 loads stored in two different places will not keep

FIG. 5.—PESCATOREA LEHMANNI: FLOWERS RICH VIOLET: TO THE RIGHT LIT, COLUMN AND POLLEN MASSES. (SEE P. 44.)

the sight is as hideous as would be the chief figure to a zoologist if it had three eyes. A most important picture of Nicholas Poussin's is lent by Mrs. Mollison in the "Triumph of Pan," 141. A very curious picture is the "Israelites' Departure out of Egypt," by Bassano. Raphael is represented by two assumed portrait groups in 160 and 199. In gallery No. 4 are numerous Italian and curious archaic pictures, of which 186, "The Adoration of the Shepherds," is, perhaps, the most remarkable; the perspective, if such it may be called, is extraordinary, and the numerous "cherubs" are painted, some bronze colour, others vermilion. The "Adoration of the Magi," by Quentin Matsys, 193, is a noticeable picture with the different heads strangely out of proportion with each other; and in 194, "St. George and the Dragon," by Carlo Crivelli, the dragon is no bigger than an ordinary stag-hound. "St. George, on a rearing steed, is in the act of smiting with his sword the dragon," says the catalogue. A picture remarkable for its ingenuity, good drawing, and brilliant colour is 213, "Samson Destroying the Palace of the Philistines," by Johann Victor Plazer. The only flower subject in the exhibition is a picture by Jan van Os, "Signed Van Os fec," says the catalogue, which note seems to indicate that Os did not know how to spell his own name: however this may be, the picture is a remarkably good one of Poppies, Crown Imperials, Grape Hyacinths, Roses, and Tulips in a vase. Proofs are not wanting to show that some artists are quite incapable of reverently and properly treating religious subjects, and this remark applies to religious edifices as well as personages; note the big dog in the foreground of "Interior of Church," No. 232, by Emmanuel de Witte. In the

season. About 120 loads were usually stored in this house, and about fifty more in a pit near by, covered with straw and leaves, &c., for use in the early part of the season. From this house and pit the supply of ice was frequently exhausted early in October. In the autumn of 1874 we commenced some experiments with sawdust as a material for storing ice, which continued during 1875 and 1876 with the view of finding out whether we could secure a plentiful supply of ice all the year round without incurring the expense of having to build an ice-house in stone or brick.

I need not take up space by giving the details of these experiments; it may be sufficient to say that the results were so promising that I arranged to abandon the old ice-house altogether, and made a sawdust pit large enough to hold from 200 to 250 loads, and to depend entirely upon it for our ice supply. I may here mention that a supply of ice at any time when called for all the year round, but a daily supply—and plenty of it—from the end of July to the beginning of November, is, at Dunrobin, a *sine qua non*.

The site selected for the pit was near the kitchen and larders, in the wood near the Castle, partially shaded, and with a northern exposure, while a rise of the ground to one side admitted of carts being brought above the level of the pit, so as to tip the ice down a shoot directly into it, while a hollow near by secured an outlet for a drain at any depth necessary.

We made the pit square, 20 feet by 20 feet, and 10 feet in depth, the diameter at the bottom was about 17 feet 6 inches by 17 feet 6 inches.

In order to thoroughly isolate the ice from the heat of the surrounding soil, the sides of the pit were lined with wood-dials, 1½ inch thick, nailed to stout upright

so long as 100 loads stored in one place. It may be said that our success with sawdust is altogether owing to the quantity of ice stored. That is perhaps partly correct, but the system has been successfully tried with smaller quantities. We made a pit two years ago for a shooting lodge in the neighbourhood to hold about 140 to 150 loads, and after all requirements in the way of ice had been supplied during the season there remained about fifty loads of ice to the good in December. Where the quantity of ice stored is less than 150 loads a light roof should be made to thoroughly shade the pit, and to throw off rain, so as to keep the sawdust as dry as possible. The sides should be left open to admit of a free passage of air at all times. A light roof of some non-conducting material, such as wood and felt, would be of advantage, whether the quantity stored is great or small, only in the latter case it is a necessity.

This method of storing in sawdust will be found very suitable for tenants of shooting lodges, as they can by this means store a supply of ice at a trifling first cost, where the expense of a stone or brick ice-house would, under the circumstances, be out of the question.

It will be found equally applicable to salmon-fishing stations, and those interested in salmon fisheries would do well to take note of the system for future use. Where existing arrangements and appliances are found in every way satisfactory for preserving ice it might be advisable to "let well alone," but where they are unsatisfactory I would advise a trial to be made of a sawdust pit before throwing a lot of money into the mortar tub. *D. Melville, Dunrobin Castle Gardens, Sutherland.*

GARDENING AT BOURNE-MOUTH.

RECENTLY, whilst staying for a few days at what a few years ago was nothing but a forest of Scotch Firs, Bracken, and Heather, but which has now become a famous seaside resort, called Bournemouth, I was forcibly struck with the dearth of good gardens, or what I ought perhaps to term taste in gardening.

The nature of the soil and the woods of Scotch Firs in some instances preclude much being done in the way of real gardening, but there are hundreds of villas where the trees are so thin, and the soil so good, that in such a climate model gardens might be made at but a trifling expense, and yet all the attempt at gardening made is the usual strip of lawn for croquet or lawn tennis, a few bits of ivy clinging to the boles of the Scotch Firs, and here and there a Rhododendron, an Arbutus, or a Juniper. If one may so put it, the people seem to be ignorant of what further beauty and enjoyment they might have at the same cost they already pay for, with variety of shrubs alone, they might have gardens of the first order at virtually no cost after the first outlay.

The meagre variety in the generality of gardens must be apparent to the most casual observer; for the most part they consist of the common and variegated *Euonymus*, *Rhododendrons*, common and Portugal Laurel, *Arbutus Undco*, *Juniperus macrocarpa*, and Ivy—and this in face of the fact that, in rare instances certainly, all the following shrubs and Conifers were growing away more luxuriantly than I have ever before seen them:—*Araucaria imbricata*, and even the greenhouse variety, *A. Bidwilli*; *Abies Douglasii*, *A. Morinda*, *A. nobilis*, *A. Pinsapo*, and *A. canadensis*, *Cupressus Lawsoniana*, *Juniperus macrocarpa* (this is the plant of all others for Bournemouth), *Pinus insignis*, *P. austriaca*, *P. Laricio*, and *P. ponderosa*. The *Retino-sporas* of all kinds do splendidly, and so do *Thuopsis borealis* and *T. delabarata*, and all the *Arbor-vitæ*, specially *Thuia Lobbiæ*, *T. gigantea*, and *T. occidentalis*. Other evergreens that were doing well were *Andromedas*, *Pernettyas*, *Berberis*, *Cotoneasters*, *Hollies* (especially the variegated kinds), *Osmantus*, *Phillyreas*, and *Skimmias*.

It is questionable whether there is another neighbourhood in the kingdom where such a variety of rare trees would grow and flourish, and it is certainly to be hoped there is not another where, taking into account all the circumstances of situation, climate, and, from appearances, wealth, where good gardening is so much neglected. *W. Widdsmith, Heckfield.*

ADLANTUM WILLIAMSII is a Fern that may be recommended for cutting during the winter months, as, unlike some of its class, it retains its bright green colour through the winter.

The Rosery.

ROSES ON THEIR OWN ROOTS.—"Wild Rose" has given us the *pros* and *cons* with regard to Roses on their own roots. I think, however, that I gather from his letter that he does not quite believe in them; nor do I, after a certain point. But I am certainly in favour of striking cuttings from strong-growing Roses. Weak growers are a failure on their own roots. I do not for a moment think that Roses on their own roots are better than budded ones in any one respect, but I am of opinion that the strong-growing sorts are quite as good. "Wild Rose" tells us that amateurs are favourable to the plan, but nurserymen take the opposing side. I think a solution of this problem is easily found. If all Roses were grown on their own roots the trade of the nurseryman would be virtually destroyed. It is such easy and quick work taking cuttings, whereas budding on dwarfs is, to me, a most laborious business—especially when, touched up in the lumbar regions, like "Wild Rose," or when one has to stoop down 6 feet or crawl on one's knees, to insert a bud in a seedling Briar; and it is on this account, I surmise, and also because of failures in budding, that the amateur buys so largely of the nurseryman. "Wild Rose" does not give us his own experience about Roses on their own roots; perhaps he has not tried them sufficiently to give us his opinion.

I myself for the last five years have tried Rose cuttings, and I think I may say, on the whole, with a fair amount of success. My first year was a failure. I placed the cuttings in pots in an old Melon-pit, and the result was they nearly all damped off. The following year I tried again, but this time placed the cuttings in the open ground. In November I gave the ground a good coating of burnt earth; forked it in, and when dry on the top made it quite firm, like an Onion-bed. I then put in the cuttings by thrusting them into the ground as deep as I could get them. I find this is a much better plan than using a dibble, which is liable to leave a vacuum round the base of the cutting, and if this happens the cutting, of course, dies. It is necessary to use a good thick pair of leather gloves to plant the cuttings in this way. Last winter, in spite of the cold, about 60 per cent. of the cuttings rooted (they were protected by a little short litter), and most of them bloomed last autumn. I am trying the Baroness this year for the first time; at present every cutting looks as healthy and fresh as possible. Teas I am trying in pots, in a cold frame on cinder ashes, and at present I am satisfied with them.

There is no doubt that the great secret of getting Rose cuttings to do well is to select ripe wood. I am quite aware that one does not get a splendid maiden bloom from a cutting; on the other hand I find that Roses on their own roots come in rather later than budded ones, and are very useful for a late show. On my soil (stiff clay) I never could get Charles Lefebvre to grow, either budded on a standard or on the seedling Briar. I tried cuttings, and it grows "like a weed," and gives me splendid blooms. The following Roses I find do well on their own roots:—*C. Lefebvre*, *Marie Baumann*, *Miss Hassard*, *La France*, *Thomas Mills*, *Madame Nachary*, *Countess Serenyi*, *Marie Kady*, *Alfred Colomb*, *Captain Christy*, *Jules Margottin*, *Edward Morren*, *Mad. S. Fropot*, *Sir Garnet Wolseley*, *Madame V. Verdier*, *Auguste Rigotard*, *Dupuy Jamin*, *Abel Grand*, &c. To sum up, I consider Roses on their own roots a great help to the amateur; but he must bud too, if he wants fine maiden blooms for exhibition. *Edward L. Fellowes, Wimpole Rectory, Royston.*

ROSES IN POTS FOR LATE FLOWERING.—At no season of the year are Roses more welcome than just before they come in from out-of-doors, say

between the supply of forced hybrid perpetuals and the out-of-door display in June and July, according to climate and locality. There are few people—few gardeners at least—who do not plant a greater or less quantity of Roses every autumn and winter, and it seldom happens that people are stunted to a dozen or so of plants. Finding myself with a few surplus plants upon one occasion about this time of year, I had them potted up, plunged in a bed of coal-ashes behind a north hedge for the winter, and there left until the spring. In due course the plants were pruned, but not removed until they were "in bud," after which they were brought forward under glass to come in before the Roses out-of-doors. The flowers came in so useful that I have usually made a point of potting up a few plants every winter since. The plan is also a cheap way of getting up a stock of pot Roses where there is any difficulty in getting established plants in pots at once. Indeed for cutting purposes alone it would pay any gardener, and his employer too, to put up fifty or a hundred such plants, the best that could be obtained, every winter, for supplying cut Roses during the month of May when cut Roses per dozen are at a pretty handsome price. The great point in favour of this suggestion is that the plants are thoroughly under the control of the cultivator, and can be brought into flower at any time. Most people have their own choice as to varieties, but those who have an eye to bulk should include half-a-dozen plants of Paul Nerou in the list. It is a free bloomer, and produces flowers of immense size from young plants. *W. Widd.*

ROSES.—What becomes of the immense quantities propagated annually both in private and public establishments of the Queen of Flowers. In looking through the houses at the Castle Street Nurseries the other day in Salisbury, and seeing nearly 4000 winter grafted Roses in various stages of growth in one of the ranges there, the above question arose in my mind, and leads me to ask whether the annual death-rate is in proportion to the number of plants propagated, or whether there are sufficient recruits enlisted in the ranks of the "Rosarian" annually as to account for the continued demand for Roses, making due allowance for the havoc which the frosts of the last couple of winters wrought amongst the trees. *W. W. W.*

ROSE ALLEN K. RICHARDSON.—You have mentioned in your paper this week a good buttonhole Rose: may I recommend another, in the above charming variety? It is somewhat in the style of *Ma Capucine* and *Nankin*; but is very peculiar in colour. I saw some blooms of it under glass at Mr. T. B. Hall's, at Rock Ferry, near Birkenhead, and then the base of the petals was quite dark, and the upper half light, and as the general colour is dark copper it was very striking. There are many Tea Roses which are not what is called exhibition Roses, but which are very lovely and well adapted for bouquets, and of this class that above-named is one of the best. *Wild Rose.*

SOME FACTS ABOUT CONIFERS.

(Continued from p. 12.)

ECONOMIC VALUE.—The economic value of the Conifer surpasses that of all other forest-trees together, supplying a larger proportion of timber used. The woods of the Fir, Pine, and Cedar are valuable for all purposes, and some of them are of immense durability. The money value of the Fir timber imported into Great Britain in 1879 from Scandinavia and Russia alone was about £5,000,000 sterling, the total value of the imported coniferous wood in this country being about £9,000,000 sterling. Most countries of Europe depend largely for fuel and timber upon their plantations of Fir and Pine. Even in our own country *Pinus sylvestris*, which formerly spread over a great part of Scotland, has been a source of wealth to its owners. The forest of Rothiemurchus, between Cairnrog and the Spey, 16 miles in extent, produced, according to Sir T. D. Lauder, sometimes as much as £20,000 per annum in Pine timber. From the adjoining forest of Glenmore, sold by the Duke of Gordon for £10,000, were produced forty-one sail of ships of upwards of 19,000 tons burthen. The indigenous Scotch Fir is now, however, to a great extent superseded by the Larch.

GARDENERS' SOCIETIES.

THE success which has attended the establishment of gardeners' societies for mutual instruction and social intercourse in some large private gardens is perhaps not to be wondered at, seeing that the persons who work and live together in places that are generally remote from towns, if not from villages, have little else to engage their attention besides their ordinary duties, and it is natural they should turn to the meetings and their organisation affords, and the duties in connection with them, for the recreation and social communion afforded. It is in towns, in thickly populated suburbs, &c., where there are many and varied attractions appealing to the senses, that the difficulty of establishing efficient societies is felt: not that it is to be supposed the gardener of every grade is a man who lives a life separate from his fellow men, but where gardeners exist in numbers it is natural that they should turn to those who are fellows in their profession for the companionship they aspire to. In the suburbs of London, for instance, there are a large number of persons engaged in gardening who may be truly designated as "gardeners—and gardeners." A few among them are pretty well informed as to their duties, and can bring to their tasks a fair amount of intelligence and experience; but the large majority are young men, who have had but little training, and whose knowledge is of a very imperfect character.

It is often a cause of reproach that jobbing gardeners are given to drinking, and as a result, careless in their work. The ranks are frequently reinforced by ne'er-do-weels, and the younger members of the class go to the garden from school or the streets, and pick up such practical knowledge as best they can. Is it possible to bring remedial and improving influences to bear on this class? It may be done; but what is attempted needs to be performed carefully and with much tact. What is needed is that a few leading gardeners of known position and character, who can be looked up to as leaders and trusted, to form and manage the organisation. A comfortably warmed and lighted room is essentially necessary, which should be opened on each working night, if possible, or, failing that, at least three nights a week. There should be comfortable seats, a supply of gardening papers, and such attractive works on gardening as are likely to secure the attention of those sought to be benefited. The leading idea should be that the gardeners are called together for mutual instruction; so that every one should, as far as it is possible to give effect to the idea, assist to contribute to the general stock of information imparted.

Pleasant conversational meetings are of great importance, in which the least informed should be encouraged to participate, if only by asking questions. One night a week some member of the society should prepare and read, or have read for him, a paper on some points of practice of a seasonable nature, so that as far as possible the instruction sought to be conveyed should have the greatest interest for the largest number of the members. Present matters of interest are always of a more engaging character than those relating to the past or the future. The papers should be couched in the simplest terms—brief, brisk, and interesting. The great difficulty is to find among the members a sufficient number to undertake the preparation of papers; and if enough cannot be had from within the society, then efforts must be made to get some from without. But it is a principle of the highest importance that such societies be made mutually instructive; and a paper from a member will be found to have much greater interest than one from a non-member, however high may be his position in the gardening world. The reading of a paper should be followed by a conversational discussion, and if two or three of the best informed of the members will look up information on the question in debate, so as to insure a discussion, the proceedings will go much better in consequence.

And some recreation is absolutely necessary, such as can be had over games of chess, draughts, dominoes, and such-like. Cards are objectionable in certain cases, and only to be introduced under carefully considered and well-defined regulations. Such attractive papers as the illustrated weeklies, *Punch*, &c., will be found of much value. Two energetic members of the society, at least, should be told off at intervals to act as stewards, who should be responsible for order and the comfort of the

members. They should be men amenable to discipline, and qualified to exact it from others. The driving-power of the society should be the secretary, and he ought to be a gardener—intelligent, active, full of interest in his work, and willing to devote himself to it. The value of such a secretary is hardly to be estimated. No new regulations should be introduced without the consent of the members, and after having been fully discussed by them.

The expenses of such a society need not be large if properly managed. The income will depend on the number of members, and the outlay should never exceed the income of the society if it is possible to keep it within bounds. The individual subscription should not be beyond the means of the members, and in every district and suburb there will be found sympathising individuals willing to become honorary members at a higher rate of subscription, or donors of periodical sums. Some, too, could be induced to make presents of the illustrated and the weekly gardening papers; such welcome gifts materially assist the funds.

During the late spring and summer months, when gardeners, as a rule, work far into the evening, the attendance of members will be thin as a body and unequal as individuals, but this is inevitable. It is well that every effort be put forth to have the room open in the evening for the sake of the few who may be willing to put in appearance. Everything that can be done should be done to attract the younger members of the gardening class. *R. D.*

DRACÆNA GOLDIEANA.

EVERY one now is familiar with the mottled and barred foliage of this handsome stove plant, introduced from West Tropical Africa to the Glasgow Botanic Garden some years since, and put into commerce by Mr. W. Bull. At the time of its introduction some doubt was felt as to whether this was rightly named a *Dracæna*. Quite lately, however, the plant has flowered—first, we believe, at Marseilles, in the garden of Dr. Renouard, who has published a descriptive pamphlet on the subject,* then in the nurseries of Mr. W. Bull, and in those establishment our illustration (fig. 6) was taken by Mr. W. G. Smith, and also in Mr. Bause's hands at the Melbourne Nursery of the General Horticultural Company (John Wills). The flowering of the plant has set at rest any doubt that had been felt as to its identification; indeed Mr. Baker, in his monograph in the *Journal of the Linnean Society*, vol. xiv., p. 535, did not hesitate from the first in assigning it this position.

The numerous flowers are borne in a close semiglobose cyme or head at the end of the stem, the flowers being intermingled with broad sessile bracts, becoming gradually smaller towards the apex of the inflorescence, and described as of an intense rose colour by Dr. Renouard, but on the specimens exhibited the colour was a dull and pale violet-brown. The individual flowers are about 1 inch in length, cylindrical and tubular for about half their length, and then separating into six linear obtuse concave segments of a pale violet-brown colour. The six stamens arise from the throat or upper edge of the tube of the flower, and are more or less concealed in the hollow segments of the perianth, the filaments and the style are pure white in colour, the small oblong pale yellow anthers are attached by the middle of the back to the filaments.

Our note on the colour of the flower was taken from the plant shown by Mr. Wills, and differs from the description of Dr. Renouard, who found the flowers to be pure white, and fragrant. According to Dr. Renouard, also, the flowers expand in the afternoon, the segments becoming recurved, and the stigma ripens before the anthers (protogynous), as also observed by Mr. Smith, so that cross-fertilisation by insect agency is a necessity in the wild state.

It is probable now that the plant will flower generally, for it is one of the as yet unexplained phenomena that some plants, like this *Dracæna*, after having been cultivated for years without producing flowers, suddenly, and without obvious cause, produce their flowers about the same time in widely sundered localities. In nurseries the plant has probably not flowered before, owing to the stock being cut up so freely for purposes of propagation, but this can hardly apply to private establishments, where the plant has been allowed to grow on.

* Note sur la floraison du *Dracæna Goldieana* observée dans les serres de M. G. Renouard, Marseilles, 1881.

Orchid Notes and gleanings.

WORK IN THE HOUSES.—In Orchid growing it is always necessary to be looking forward to future requirements, and as the work in the houses at the present time is lighter than at any other season, it offers a favourable opportunity for cleaning and preparing crocks and composts in readiness for a busier time. We are most particular in the preparation of peat for Orchids; this should be thoroughly dried and well aerated before it is used for potting purposes, and all earthy matter should be threshed or sifted out of it. Peat prepared in this way retains its porosity and sweetness for several years, no matter how heavily it may be watered. It is a common occurrence even at the present day to see great masses of sour peat piled up over the roots of epiphytal Orchids, in which it is impossible for the roots to remain in health more than a season or two; and a continuance of this treatment soon renders the plants but little better than imported pieces. The greater part of the plants in our East Indian-house were top-dressed and repotted last month, and any that required it were then lowered. We prefer doing this work among *Vandas*, *Acridies*, and *Saccolabiums* during the dull part of the year, as we then rarely lose a single leaf through the operation; while if it is left undone till the hot weather sets in it is difficult to keep an equable degree of moisture about the plants, and they suffer in consequence. Plants of *Oncidium lanceanum purpureum* are now in the right state for a shift. We prefer growing this plant in a basket or cylinder, not using too much material about the roots, and that of a light nature, principally sphagnum. This plant should have a damp position in the East Indian-house. The *Phalenopsis* are now commencing to open their flowers, and will soon make a fine display. These must be kept regularly moist at the root, and should be examined daily to see that no water lodges in the centre of the plants, and it will do them good to give the foliage an occasional sponge over. Among the *Cattleyas* we are not doing much at present, but shall shortly commence and re-surface the greater part of them, and as we use a good proportion of sphagnum moss, this can be sorted and cleaned during spare time in readiness for the operation. With the *Cattleyas* we have a few plants that give us a little anxiety during the winter months: these are *Odontoglossum Phalenopsis*, *O. vexillarium*, and *O. nevium majus*. They should each be kept well up to the light during the winter months, and *O. vexillarium* will require watering with greater care than either of the others, which should always be kept moderately moist at the root. The weather up to the present time has been most favourable for keeping the cool Orchids under healthy conditions. With the constant appearance of fresh flower-spikes in this house, every care must be taken to prevent them being devoured by slugs. A few pots of *Adiantum cuneatum* that are throwing up young fronds may be placed under the *Odontoglossums*, and if these are moistened over every evening the slugs soon find them out, and in this way many will be trapped before they reach the flower-spikes. The following are the temperatures we like at present:—East Indian-house, 63° by night and 67° by day; *Cattleya*-house, 58° by night and 62° by day; cool-house, 50° by night and 55° by day. *J. Roberts, Gunnersbury.*

A MONOGRAPH OF THE GENUS *CYPRIPEDIUM*.—From the *Illustration Horticole* we learn that a Mr. Passetouet has presented a monograph of this interesting genus to the Royal Horticultural Society of Angers. It is illustrated by fifty coloured plates and treats of the history and cultivation of the species. We hope it will be published without delay.

VARIABILITY OF ORCHIDS.—Passing through one of our nurseries lately we were struck with a peculiar variety of *Odontoglossum crispum* (Alexandre), in which the flower segments were so narrow as to be almost linear, and of a pale greenish-yellow hue. From a decorative point of view the plant in its present state would not recommend itself to most people, yet we are assured that this very plant last year produced flowers of quite another character, so fine, indeed, that the plant was marked as being of a superior variety, and testimony to this effect was still

to be seen on the tally. The moral would seem to be, that persons should not hurriedly discard what seems a poor variety, for the next season it may assume quite a different guise. No difference in treatment, so far as known, can be adduced to account for the extraordinary change alluded to.

CALANTHE TURNERI.—Now that the two varieties of *C. vestita* and *C. Veitchii* are on the wane, this variety is coming into flower and very useful it is in prolonging the succession. This and the pure white variety, *C. Turnerii nivalis*, seem to require rather more heat than the others to open their blossoms well; a night temperature averaging about 65° suits them better than one 5° lower. As the plants of the earliest flowering varieties go out of bloom they should be placed where the temperature is not lower than 55° at night; and they must not receive any water until it is time to start them into growth again about

main a little longer in a cooler house, but while we were potting other occupants of the East Indian-house, it was convenient to do these at the same time. I use a larger proportion of fibrous peat in the compost than for some things, as in turning the plants out of the pots it is found that there are more healthy roots in the peat than in the sphagnum. Indeed all these plants make a considerable proportion of roots, and should not be pinched for pot-room. It will be necessary to put a stick to each stem to keep them in their places, as they will not remain in an upright position by themselves. Press the compost firmly around the roots, water very sparingly at first, until new roots are formed, when water must be given freely. We grow three distinct species, the best of which is, I think, *T. Marshallii*. It has beautiful pure white flowers, with just a touch of yellow at the base of the lip. It also grows and flowers very freely. *T. Stonei* makes the most vigorous growths, and

as *Odontoglossum biconense*, many of the *Oncidiums*, such as *ornithorhyncum*, and several others.

ORCHIDS FROM SEEDS.—In reading Mr. Douglas's note on raising Orchids from seed, I was somewhat pleased to see he had made a note of Mr. John Day's rare variety of *Cyripedium Stonei*. I think it may interest Mr. Douglas to hear it had occupied Mr. Day's special attention, but acting upon the sound advice of his skilful gardener, Mr. Gedney, he wisely left it alone—I say wisely, because it is well known to bring distress and sometimes even death to very healthy plants. But being in the neighbourhood of Dorking some two months since I paid a visit to Sir Trevor Lawrence's noted Burfordian collection, and there I saw the rarest of *Cyripediums* (*Stonei platyanium*) bearing a fine seed-pod, and, as Mr. Douglas suggests, crossed with its own pollen. Mr. Spyer tells me he thinks it is nothing but a mon-

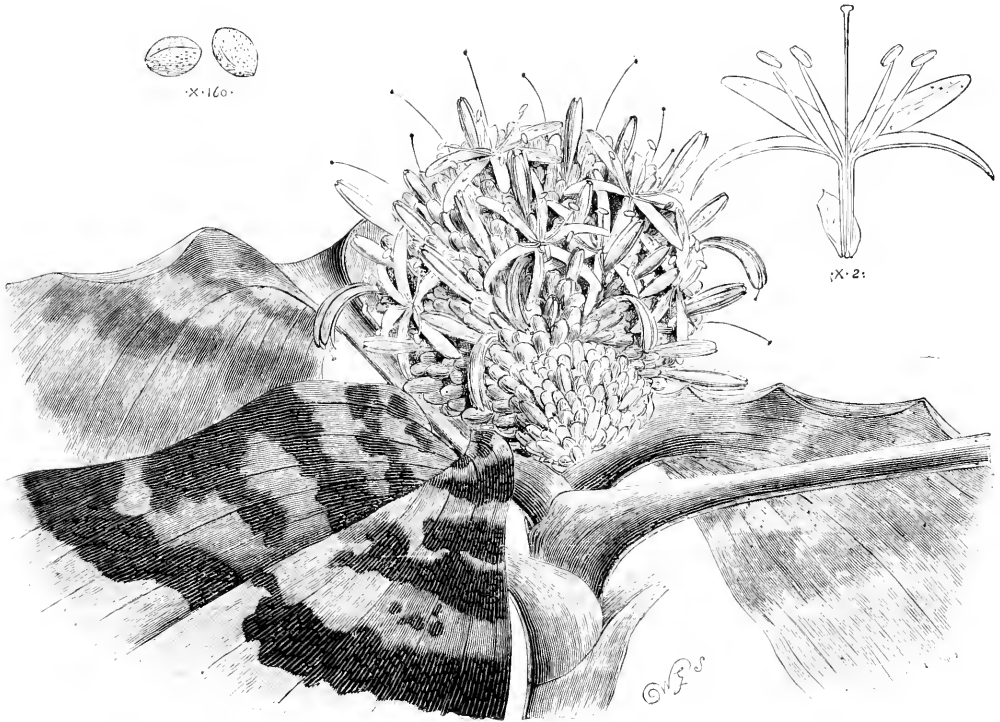

FIG. 6.—*DRACENA GOLDIEANA* INFLORESCENCE, NAT. SIZE—FLOWER AND POLLEN GRAINS MAGNIFIED. (SEE P. 48.)

the end of February, when they should be potted. *J. D.*

ANCRECUM.—The two best known probably are *A. sesquipedale*, of which some fine flowers may now be seen in Mr. B. S. Williams' nursery; and *A. eburneum*, a robust-growing, winter-flowering variety, of which, with the variety *viens*, there are numerous examples in bloom just now in the Royal Gardens, Kew.

DENDROBIUM DOXALLII is a very pretty species, now in bloom at the Victoria Nurseries. The flower is of medium size, with narrow violet tinted segments, and with a rounded concave lip, like a salt-spoon, rich orange-yellow in the centre, with a narrow margin of pale violet.

THUNIAS.—These easily grown Orchids have now passed through their season of rest, and may be started into growth. We should have allowed them to re-

produce a good succession of large, richly-coloured flowers, of a rosy-purple colour. *T. alia* is the least desirable of the three, but it increases freely, and grows vigorously, producing abundantly its racemes of pure white flowers, the lip lightly marked with purplish lines. *J. D.*

MAXILLARIA LEPTODOTA is a very curious Orchid, remarkable for the very long narrow yellowish segments, purplish-brown, deflexed at the base, resembling those of some of the *Masdevallias*, as the plant itself does in habit. It has the advantage of remaining in flower for two or three months; at least, it has been so at the Victoria Nurseries, Holloway.

ODONTOGLOSSUM ROSSII MAJUS.—The attractiveness of this pretty Orchid with its whitish segments marked by brown bars, is heightened by the long period during which it remains in bloom. Many Orchids are most remarkable in this particular, such

as *strosity* produced by seed from the ordinary *Stonei*; that being so, it will be a very anxious time from now to the flowering of the seedlings, and that being Mr. Spyer's belief, it will be very interesting to know if any degenerate, and so produce the ordinary form of *Stonei*. *H. C., Forest Farm, Windsor Forest.*

THE VANDAS at the Holloway nurseries are just now in fine order. Not many of them are in bloom, but the plants are furnished to the base with leaves bearing that rich deep green colour indicative of a healthy appetite and a judicious food supply. The practice in this establishment is to sprinkle guano-water upon the stages between the plants and elsewhere about the house, not on the plants themselves. The ammonia vapour so engendered must contribute to the vigorous and healthy growth, though we imagine this mode of feeding requires to be done with great care and judgment, as an overdose would throw the plant out of health; or, at least, tend to prevent it flowering by unduly stimulating growth.

The Flower Garden.

THE very mild weather we have lately experienced, so unusual at this season, when we expect the earth to be bound up with frost, or covered with snow, may have many disadvantages through being so unseasonable, and is a bad preparation generally for vegetation to withstand the rigours of very severe weather. On the other hand, for planting and ground work it will be welcomed by many who have such work on hand, as enabling them to get well forward with it so that it may not interfere with the imperative necessities of the busy time which is fast approaching. In the case of new plantations, it may be useful to remind the planter that it is necessary to look forward and calculate the future effect of his work; at present, and of necessity for present effect, the plants must stand much thicker on the ground than will be required eventually. It should therefore be the rule to select such as are intended for permanent occupants and plant them at suitable distances at first—such spaces being enough to allow of a perfect development of size and character, and then to fill up all the intervening spaces with such shrubs and plants as are calculated to form a good shelter for a time, but which will cause no regret at their removal when the permanent occupants require more space. And this reminds one that the present weather is suitable for the prosecution of such work in plantations already made; these should be gone through annually after the first year or two, and by cutting some out and removing others back a perfectly furnished appearance may be maintained in the borders at the least expenditure of time and trouble when it is made an annual practice, for if left too long we can hardly expect to find the best trees and shrubs unjured.

Another operation which may suitably be carried on in open weather is the renovation and trenching of all vacant flower-beds and open spaces not filled with spring flowering plants, exposing as rough a surface to the influence of the weather as possible; but whilst we are so uncertain as to what weather we may yet experience any remarks we may have to make under the head of "Flower Garden" must be confined to recommending the adoption of measures of precaution. There is no question that many plants are on the move, and no doubt a very severe frost would try the vitality of many of them; for example, many of the bulbous and herbaceous plants are pushing through the soil, and should be covered over with cocoa-fibre, which may be removed and dug in by-and-by. Standard Roses, which are much liable to be injured by severe weather, after a long continued mild time, may be protected by dry Bracken, inter-laced with the branches, and a string of matting passed round to keep it in place.

The stores of budding plants in pots or boxes should be frequently looked over, to remove all which are suffering from the effects of too much moisture. In particular we find that in consequence of the last autumn being so dull, cloudy, and rainy, the cuttings of Pelargoniums were so succulent, or full of sap, that they have been more than usually liable to damp off, owing to the unripened state of the wood; this will necessitate a considerable amount of propagation in the spring, preparations for which must be carried forward without delay. Old plants potted up from the autumn may with advantage be treated to an intermediate temperature for a time, which will bring them on to furnish a good supply of cuttings with a little ripened wood at the bottom. These may be put singly into small 60's, placed on a shelf or stage, which can be kept moist by pouring water on it, but do not water the plants themselves until rooting commences; these often make much better plants than autumn succulent cuttings. An abundance of air should be admitted on every possible occasion, and a little heat applied at the same time will greatly assist to counterbalance the effects of damp.

ROCKERY.—For reasons stated above there is not much to advise in this department at present; the sharp cutting winds we may expect by-and-by are often very injurious after a moist, mild time, and it would be well to have some temporary kind of shelter to break their force. This may be done by a few branches of evergreens stuck in the beds about the

plants, and if any show signs of unusual activity of growth, a little cocoa-fibre may be used with advantage. The formation of new work in this interesting department may now be carried out with advantage. The preliminaries will be to get together a large supply of various-sized blocks of stone, the larger the better, and some loads of good holding soil. I hope to enlarge on this subject later on. *John Cox, Kettle.*

SPRING-STUCK CALCEOLARIAS.—The popularity of Calceolarias as flower garden plants, and the display they produce during the summer months, seldom fail to attract the notice of those who are about to embark upon the pleasure of keeping a garden. They are about the first flowers that are inquired after by the beginner in gardening, who is often disappointed when he is told that he is too late to propagate them this season—"They must be struck in the autumn, you know." It may be useful to owners of small gardens, and especially to owners of new gardens in a moderate way, to know that plants propagated any time during this month will make excellent material for planting out during the coming season at a cost that is hardly worth mentioning. Any one who knows how to make what gardeners call a moderate hotbed, need have no fear of propagating them by the thousand, and cuttings will be abundant enough during the present month,—in fact, thousands of them are thrown away every spring, the tops of autumn-struck plants. It is important at the outset that the fermenting materials should not be too "green" (*i.e.*, too fresh) when the bed is made up. For this purpose it is always safe to use a rather large proportion of leaves with a minimum quantity of stable manure, and if this precaution be taken much delay need not take place in preparing the materials to make up a gentle hotbed. All that is really necessary is to create as much warmth as will accelerate the rooting process, and give the plants a good start into growth. If the bed is made about 3 feet high at the back and 2 feet at the front, sufficient heat will be generated to answer the intended purpose. Enough material should be put inside the frame to bring it to within a foot of the glass, and if to this is added 6 inches in depth of leaf-mould in two layers, the cutting when inserted will be within about 4 inches of the glass when the operation is finished. The object of the two layers of leaf-mould is, that the bottom one should be composed of half-rotted material, in order that the roots may lay hold of the rough portion of the compost, and lift with good balls at planting time. The topmost layer should consist of fine and well-rotted mould with 2 inches in depth of sharp sand laid upon the surface, into which the cuttings should be inserted. The thin layer of sand is beneficial in absorbing moisture, and therefore a safeguard against damping until the cuttings take root; it also promotes the rooting process. The cuttings should be inserted at about 6 inches apart, which will leave sufficient space for the plants to grow until planting time. As a safeguard against accident it is best to wait until the heat of the bed is on the decline before the cuttings are put in, and by the time they are rooted and are fairly started into growth the heat of the bed will have almost entirely disappeared, leaving a stock of healthy plants gradually hardened off, and in the finest possible condition. The plants should have their "points" pinched-out after they are established at the root. The practice above related is not often resorted to, notwithstanding that it affords excellent facilities to amateurs and others of increasing a stock of popular plants after the severity of winter is past, to say nothing of its advantage to those who are about to stock new gardens. *Cultivator.*

Grapes and Vineries.

THE earliest Vines will now be coming into flower, and when they are in that stage let the evaporating pans go dry until they are set, but on bright days damp down the paths and borders with tepid water in the early part of the day. Tap the rods several times daily to disperse the pollen; it is a good plan to go over the shoots and stop them just before they come in flower, and then let them go until they are set. Stop them at three or four joints beyond the bunch, according to the space at disposal on the trellis. Give a good watering if wanted before they come into flower, and they will not then require any more at the roots until they are set and thinned. Keep the temperature at 65° at night, with a rise of 10° by day,

or a few degrees warmer if the weather is very mild. Raise the temperature to day heat early, and force when there is sun and light. Admit air on the back ventilators whenever the temperature reaches 75°; it is a good plan to give a little air early, and increase it as the temperature rises. Always be careful to avoid cold draughts, and close early while the sun has full power. If succession Hamburgs were started as advised in my last Calendar, and fermenting material is used, only very little fire-heat will be required while this mild weather lasts, but sufficient should be given to keep them at 55° at night, with a rise of 10° by day, but if the weather changes to severe from a few degrees lower will be better. Muscats started on Jan. 1 must have the temperature raised to 56° at night, with a rise of 10° by day, gradually increasing it as the buds commence to swell. Syringe the rods with tepid water whenever they become dry, but do not syringe after 2 P.M. Keep the paths and borders well damped down several times daily, and do not give air till the temperature reaches 70°.

Top-dress the borders of later houses where there is a sign of weakness in growth or the Vines do not finish well, taking off all the old soil to a depth of 6 inches; do it carefully with a fork so that the roots be not damaged, and top-dress with good turfy loam, charcoal, and a little snot or wood-ashes. Use the soil in a sufficient state of dryness that it may be well trod without binding; after it is done a good soaking of water will be beneficial to settle the soil about the roots. If the Vines are old and exhausted, and the roots are in both outside and inside borders, it will be a great benefit to lift the Vines and remake the borders, during the outside one year and the inside another. Give ample drainage and turn a turf grass-side downwards upon the drainage. In lifting the Vines great care must be taken not to damage the roots, but lift them all out carefully with a fork and cover with mats until the border is made ready for them, then lay them carefully in the new soil about 6 inches below the surface; if any of the roots are damaged cut them clean off with a sharp knife. The border should not be made the full width the first year, but about 8 feet wide; it can then be added to as the Vines require fresh soil. Use for compost good loam, bones, charcoal or lime rubbish, with a little snot—about a bushel of bones to a cart-load of soil, and get everything ready before commencing to lift the Vines.

All late Grapes will now be better cut from the Vines, and the Vines pruned as soon as possible. Keep the temperature of the Grape-vine as near 45° as possible. Keep the earliest pot-Vines at a temperature of 65° at night, with a rise of 10° by day; they will now require plenty of clear tepid water at the roots, with a little drier atmosphere as they come into flower; give air early on bright days, and close early in the afternoon. *Joshua Albins, Lockinge Garden, Wantage.*

LATE WHITE GRAPES.—The correspondence which has taken place respecting Pearson's Golden Queen deserves a special remark, inasmuch as we are advised through the Calendar of Operations for the week ending December 31 (for Vines) to cut Muscats and bottle them. They are beginning to shrivel, and their season getting over. Now, whoever has cultivated Golden Queen with success, will not be disturbing himself to cut and bottle just yet. It was sent out as one of the best late white Grapes, and it is worthy of its reputation; its constitution is hard, a free grower, and a most prolific bearer. I am convinced it improves by keeping, and it is a question if it is fit to cut till the new year for its favour. Some seasons it changes in colour (in the bunch) from pure golden to pink-coloured (such it is here this season). It is planted in the late house with the Muscat of Alexandria, and now the Muscats are shrivelled, and about all gone. Golden Queen is plump and as sweet as barley-sugar. The Vines in the late house are confined to the inside border, and receive no water from the middle of September till the Grapes are cut at the end of February, and the house started the second week in March. Growers for market have turned their attention to cultivate late kinds; they would find Golden Queen answer the purpose, coming in with Black Lady Downe's, when the London season begins and white Grapes are scarce. I would suggest inter-arching it on Muscat of Alexandria and Kaiser de Calaire to bring it to perfection in colour, and confine it to inside borders. *T. Edington, Woking, 26 Grange, Nottingham, January 4.*

The Pine Stove.

WITH the advent of another year and a continuation of the mild weather, the keeping of general temperatures is an easy matter, and the forcing of early fruiting plants is more easily accomplished. January is the most trying month in the year for Pines, and where good judgment has not been exercised in the work of firing, watering and ventilating, during the winter months, the plants will soon show unmistakable symptoms of having been subjected to treatment they dislike, and a practised eye will not be slow to discern it. The early batch of Queens should be freely showing their fruit: give them every attention by keeping the atmosphere in a humid state. Keep them at 70° by night in mild weather, with a rise from 80° to 85° by day, and make the most of every ray of sunshine. The same treatment should be given to those plants that have shown fruit since the middle of October. These will swell their fruit more rapidly after the close of this month, as they make but little progress during December and January. Their fruits will be duly appreciated in April and May—two of the scarcest months in the year for fruit. Keep succession plants and rooted suckers moving very gently during this month, for the days will soon begin to lengthen, when they will stand more heat and be less liable to become dormant. Store up a good lot of Oak leaves in a dry place for the spring and summer, and a portion of them may be used at the end of the month with one-third of good litter for building up good large hotbeds which give out heat for a long time. These beds are very useful not only for Pines but also for other purposes. The beds should be made up at the end of this month or the beginning of next, which gives them time to cool down before they are required. Take off suckers where the fruit has been recently cut, pot them in good fibry loam, and plunge them in a bottom-heat of 85°. Give them little water, only just sufficient to keep the soil moist. Where the stems or stools are not showing suckers, strip off all the old leaves and place them in boxes 3 to 4 inches deep, in light soil mixed with a little sand and leaf-mould. The stools should be placed in a horizontal position and not too deep, only covering them over to a depth of half an inch. The soil should be kept moist and the boxes plunged in a temperature of 85°. *D. Wilson, Castle Hill, Devon.*

The Orchard House.

THERE has been, and still continues to be, exceptionally fine weather for pushing on Peach and Nectarine trees in pots in a little extra heat. The temperature can be kept up to 55° at night with less artificial heat than was required last year at this time to keep it a little above the freezing point. We have also had a good deal of sunshine for mid-winter, and that is a great help in enabling us to conserve the heat by shutting up early in the afternoon. The very little artificial heat required does not dry the atmosphere much, and we can do with less water sprinkled about. It may be sufficient to dew the trees over with a fine syringe on the mornings of fine days. Where the buds are swelling rapidly, and approaching the opening stage, it is of the utmost importance, with trees in pots, to see that they have plenty of water at the roots. If they become too dry the buds are not unlikely to drop. The greatest danger is when the trees have been surface-dressed: the rich top-dressing becomes wet, while the part below, packed full of roots, gets very dry; it is better, therefore, to err on the wet side, as I do not remember ever to have seen the buds drop from the trees being kept too wet, although doubtless this might happen, especially if the drainage is not good. It may be as well to mention that I do not advise any other kind of fruit trees to be grown in the forcing orchard-house except Peaches and Nectarines, at least, not with them in the same compartment, as the Peaches will stand a higher degree of temperature, and a moister atmosphere while in bloom, than most other hardy fruits. I have always insisted on keeping the temperature down until the fruit is set; indeed, I do not care to have it higher than 55° at this season, even in mild weather.

If the trees that are to be fruited in the late house have not yet been placed there, no time should be lost in doing so. Our own trees are still out, and it

is surprising to see how rapidly the buds are swelling as the roots rapidly grow into the rich surface-dressing. We have not the least fear of the fruit not setting, and yet the roots are saturated with rain-water. They will not require any water after they are placed in the house for a week or ten days. The pots are not plunged, but are placed on two bricks laid flat on the ground, our object being to allow the air to get underneath the pot and amongst the roots. The trees should be well fumigated before the blossom-buds open, to destroy aphids, which is seldom absent from the trees if there is a large collection of them.

The pots of Strawberry plants on the shelves must be watered once a week, or at least looked over once a week, for they will not all require water so often as that; but it is a mistake to allow them to become over-dry. *J. Douglas, Loxford Hall.*

The Orangery.

PERHAPS of all fruit trees Oranges are the most easily managed, if only they can be kept clear of insects. They require pretty much the same treatment from week to week, and when the fruit is ripening a high temperature, whether it is winter or summer, and as far as my experience goes the fruit is of as good quality in midwinter as it is at midsummer. The main features of success are to obtain good varieties and good healthy trees to begin with; and not only so, but they must be grafted on the right stock. The Lemon stock is the best, and gives the most vigorous trees, which are quite fruitful enough. They never lack a sufficient quantity of blossom. The fruit will not be good if it is ripened in a low temperature; 65° as a minimum is the best, and when it is ripening do not allow too much moisture in the atmosphere, else the fruits will not be firm and good; and at that time the trees require more care in watering. Good truly maiden loam is the best potting material. *J. Douglas.*

The Hardy Fruit Garden.

CONTINUED mild and very wet weather has seriously hindered many operations in this department that require to be performed when the ground is in a comparatively dry state under the feet. Sufficient frost has scarcely existed, even during the earlier part of the day, to allow of manure being wheeled upon fruit quarters, and the wet ground has been much against good progress being made with the pruning of trees and bush fruits on all but the driest of soils. The saturated condition of the earth will be useful in indicating portions of ground that require attention to existing drains that have become choked, or the outlets suffered to be grown up with rank vegetation, and to the formation of fresh ones where necessary.

DRAINS should be put in sufficiently deep to effectually tap the underlying portion of finer earth beneath the cultivated depth; for where drains are placed too near to the surface they are unable adequately to perform their part in drying the ground during periods of heavy rainfall, while, on the other hand, their position near the surface tends to carry off too quickly the partial soakings that the earth receives from heavy showers during the summer. The thorough drainage of land devoted to fruit cultivation cannot be too frequently insisted upon, being the greatest assistance we can afford the trees in maturing fruitful growths, and also tending to increase the chances of the resulting blossom escaping the effects of severe spring frosts produced by rapid evaporation. Weather that prevents ordinary operations may admit of work being done amongst orchard trees on grass. Damp branches can have their accumulated moss and lichen more easily removed by scraping than dry ones, and are in a favourable condition for being dashed with hot lime, which will then adhere to them, assisting in checking the spread of moss on the smaller branches which cannot be otherwise cleaned, besides warding off the attack of birds from Plums, Damsons, &c. Manure can be wheeled on and spread, and in severe cases of exhaustion from the impoverishment of the soil it may be necessary to pare off the turf carefully, and give a rich surface-dressing of any good compost that may

be at hand, adding, if possible, a dressing of soot and wood ashes. If this dressing of fresh soil and manure can be lightly forked in without injury to the surface-roots it will be more speedily effective in inducing renewed activity and health.

OLD ORCHARDS on grass frequently become worn out for want of some such assistance, for which time and manure cannot often be spared. All crowding of branches should be prevented by regular attention, for the sudden removal of quantities of wood is not unfrequently attended with loss of crop and impaired energy for years after; therefore, where necessary, remove annually a few of the worst of the crossing branches, and prevent other young ones from proceeding in wrong directions by cutting back or removal. Where it is necessary to replant any trees, see that the old roots are carefully grubbed out, and that the fresh stations are trenched and enriched with manure over as large an area as may be consistent with due care for the preservation of the roots of adjacent fruit trees.

SELECTION OF VARIETIES.—It is well to plant rather largely a few free-fruited sorts that appear to suit the district, rather than to indulge in a collection which is more suitable for the dwarfs and pyramids of the garden where their usefulness is more speedily tested, and where any unsuitable kinds can be replaced without entailing the loss of time consequent upon the cutting over and re-grafting of orchard trees. A good supply of Plums and Damsons in the orchard greatly relieves the drain upon the garden for tart fruits, and leaves more space available for the more select dessert varieties; and due provision for such a supply should be considered in planting new orchards; or where many old Apple trees require removal, a portion of the ground may usefully be devoted to fruits that will yield variety for culinary purposes. Of Plums for standard trees, Victoria, Pershore, Cox's Emperor, Magnum Bonum, and Jefferson, are very certain and heavy bearers, while for an early supply the Early Prolific may be planted. *R. Crofting.*

CORDON PEARS.—It can hardly, I think, be denied that the general opinion with regard to this system of growing fruit is that the trees are short-lived—that, in fact, they will not continue in a satisfactory bearing state for a longer period than a dozen or fifteen years, and that at the end of that time they may as well be consigned to the fire for what good they are; and this, it is urged, is the one great drawback to growing fruit on the cordon principle, and as a consequence it will never become either popular or profitable in this country. I can only say that such ideas and opinions as these (in a great measure) most certainly betoken on the part of those who hold them either a strong prejudice, or a want of practical acquaintance with the subject. That the cordon method of growing fruit in England will ever supersede the horizontal and espalier-trained I am not going to assert, but with regard to this short-lived theory—in so far as it applies to Pears—I do most deliberately assert that it will not stand an impartial practical test, and that it is a fallacy which any one with old trees under their care may easily explode. To bring old trees—be they pyramid, espalier, or horizontal-trained—which only produce fruit of an inferior quality, and make growth of a stunted nature, into a healthy bearing state, we have, as is well known, only to re-graft. What will bring about a healthy state of things in the one case will do so in the other; and the best thing to do with old cordons that appear to be almost worn out is simply to cut them down to within 1 foot of the ground and re-graft at the proper time, and if the stocks are anything like sound there can be no question as to what the ultimate result will be. We have here a fair number of cordons, young and old; some of the latter, owing to their being in an unsatisfactory state and producing fruit of a worthless description, were cut down and re-grafted two years ago, and with the young wood they have since made I feel bound to say that we are more than satisfied, and that one more season will suffice for them to cover their allotted space; when this is accomplished it will not be at all unreasonable to expect crops of fruit equal in quality and quantity to those produced on trees four or five years old. Perhaps it ought to be mentioned that, with a view to further improving their condition, they were lifted last autumn, and treated to a few barrow-loads of turfy soil and well decomposed manure. *J. Horsfield, Heytesbury.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan. 15	Sale of Ladies, Canaries, &c., at the Auction Mart, Ice Houses & Morris.
WEDNESDAY,	Jan. 17	Sale of <i>Lilium auratum</i> Bulbs, at Stevens' Rooms.
THURSDAY,	Jan. 19	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.
FRIDAY,	Jan. 21	Sale of Imported Orchids, at Stevens' Rooms.
SATURDAY,	Jan. 21	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

IN an address read before the State Board of Agriculture of Massachusetts, Mr. JOHN ROBINSON, of the Arnold Arboretum, deals with the question as to the best TREES to plant for ORNAMENTAL PURPOSES. His address is, of course, principally devoted to trees suitable for growth in the State of Massachusetts, but it contains much information which will interest and instruct tree planters in all temperate climates. "In order," says the author, "to make a proper selection of trees for ornamental or economic planting, something more is necessary than a mere fancy for the trees selected. A knowledge is required of the species which will, under peculiar conditions, endure the longest and prove at the end of a generation or two that the choice was wisely made." The conditions as to temperature, moisture, and soil are alluded to, and the reasons why some countries are destitute of trees while others are thickly clothed with them.

"For countless generations species have been slowly adapting themselves to their fitting places. Natural selection, and the survival of the fittest forms for the position they are to occupy, have placed on the earth's surface the exact species in the exact positions best suited for their development. In different climates and in different situations the particular variety, too, of the species that can best sustain the local conditions to which it must be subjected, is found. This is illustrated very clearly by some of our own forest trees. The most widely distributed of North American Conifers, and one little changed in appearance, is the Red Cedar (*Juniperus virginiana*). This tree is found as far north as Latitude 50°, and south to the Gulf of Mexico, extending from the Atlantic to the Pacific. At its extreme northern limit it is only a shrub; on our own sterile hills it becomes a rugged tree, and is of no little economic value for many purposes; while in the warmer climates of Florida the same species is banished to the swamps, and furnishes that clear, soft wood used the world over in the manufacture of the best lead pencils. The Douglas Spruce, which is one of the most valuable of American forest trees, has a less extended range. It is common from British Columbia to Mexico, extending east into the Rocky Mountains of Colorado. The most interesting point in this: children inherit the characteristics of their parents; and even the seeds of trees carry with them and perpetuate the constitution, delicate or strong, that the region in which they were produced developed in the parent plants. The seeds of the Douglas Spruce from the Rocky Mountains produce trees which are as hardy here in New England as the Cedars on our hill-sides; while plants raised from the seeds of the same tree growing in the milder, moister climate of the Pacific States, led entirely to adapt themselves to our New England climate, as, indeed, do all the trees, with hardly an exception, from the region west of the Rocky Mountains. Therefore, having an insufficient knowledge of the distribution of a species, we cannot say that any particular tree is hardy, and will serve our purposes as material for forest or ornamental planting; but we must know, in the case of widely distributed species, the exact physical conditions of the particular locality from which the individual was obtained."

Comparing American with European trees of like character it is found that in Massachusetts, as was to be expected, the native trees succeed better than the European ones, and thus prove the correctness of the principle often advocated by us in the case of our colonies—of developing their own resources rather than neglecting them for the sake of introducing, except in special cases, plants from elsewhere, not to the country born. To the general rule above laid down there are exceptions: thus the European Larch is said to be a better timber tree in New England than the American variety, the English Elm (*Ulmus campestris*) in dry situations than

U. americana, and *Salix alba* than the American kinds. The choice before the Massachusetts planter is indeed large, for the tree flora of the North-eastern States is singularly large and varied, and of it we in this country have largely availed ourselves—so far as ornamental trees are concerned, for as a rule North-east American timber trees are not in much esteem here for timber, but among decorative subjects there are the Nyssa, the Cucumber-tree, *Magnolia acuminata*, which thrives even in the smoky air of Kensington; various Maples, the *Gleditsias*, the *Chionanthus*, the *Virgilia*, the *Cercis*, and a host of others.

The trees of North-eastern Asia, Northern China, and Japan are as well suited, it seems, to the North Atlantic States of the Union as to our own climate. Of Rocky Mountain trees, the Blue Spruce—*Picea pungens*—better known as *P. Menziesii*, is a tree of rapid growth, great hardiness, and of a peculiarly charming blue-green colour. We cannot say as much of it here either as to colour or hardiness, for in some places it has been severely injured by recent winters. The Douglas Fir also succeeds in Massachusetts, but most of the trees from the Pacific coast refuse to live under the more trying climatal conditions of the Eastern States.

Mr. ROBINSON is very severe—too severe, we think—on variegated trees. "The perpetuation of these monstrosities and vagaries is no credit to those who pander to the false taste which encourages such productions, nor is it any credit to those who waste their time and money in planting these sickly, evanescent forms, where the healthy plant in its natural condition is in every way preferable. . . . We have a long line of golden Oaks, golden Ashes, golden Lindens, striped-leaved, silver-leaved, or golden-banded varieties, hideous to any lover of Nature. Looking upon these sickly plants, each seems by turns more ugly than its neighbour. All should be sent to the rubbish-heap together. . . . These plants are all the result of some constitutional weakness, an impeded or irregular distribution of juices of the plant, and, like all other abnormal forms, cannot be long-lived. . . . Nor can much be said of that class of horticultural productions known as weeping trees." This, to our thinking, is the language of exaggeration. Such plants as the Purple Sycamore, Beech, Birch, or Nut, the Golden Catalpa, the Golden Oak (*Q. concordia*), the Golden Elder, the variegated Maple, and many others, are distinctly beautiful, and if used with discretion and judgment have as much right in ornamental plantations as white Willows and Poplars, Colchic Maples, red-barked Cornels, or any other tree whose foliage being normally coloured would, it is to be presumed, be allowed, by the critic we have cited, to remain. If we are to exclude from our plantations shrubs with variegated or coloured leaves, because such variegation is sometimes a symptom of disease or debility, we in England should have to banish the common Aucuba, the Golden Hollies, the whole tribe of variegated Ivies. We should have to cast out *Parrotia persica*, whose autumnal foliage is in some autumns so superbly coloured; *Virgilia* would have to go; the American Oaks must one and all be banished, for their glowing tints are but the hues of approaching death. The American Maples must be eschewed for a similar reason, and the dull monotony of green which creeps over our landscape as summer comes on would be even more unrelieved than it is now.

Neither can we consent to banish the elegant weeping trees which contribute so much grace to our plantations, nor the spiry forms of the pyramidal Oak or Poplar. Such outlines are most valuable as contrasts, and when planted in appropriate situations most beautiful. The

keeper of an arboretum, in particular, has to keep in view not merely practical utility and beauty but instruction and interest. A peculiar variety may have little or no claim to retention on the score of beauty, but its importance as an exponent of the laws of growth, of the past history and possible future development of the tree, may be very great. Let us have, somewhere at any rate, illustrations of every possible variation. It is well to satisfy our sense of beauty and fitness, it is better to increase our knowledge. Abuse is one thing, but careful use is another; and it seems mere affectation to decry the one because some people are not wise enough to avoid the other.

— EARTH WORMS.—The interest excited in these creatures since the publication of Mr. DARWIN'S book on this subject, reviewed in our columns (vol. xvi. p. 500) will be increased by the interesting communication made by Dr. GILBERT to the Scientific Committee on Tuesday last, and reported in another column. The quantity of nitrogen in the worm-casts in proportion to that of meadow or arable land is not absolutely greater, but what there is rendered more available by being brought more to the surface and more within the reach of the roots by the agency of the worms. We may refer to our report for further particulars of this interesting experiment, which will probably be repeated and extended.

— A VERY PRETTY AND NOVEL BOUQUET was shown by Mr. CANNELL at the meeting of the Royal Horticultural Society on Tuesday last. It was composed of sprays of *Cineraria cruenta*, *Agathaea colchica*, *Marguerites*, and *Pyrethrum fruticosum*, lightly put together, so that each flower could be seen by itself; and the elegance of the flowers and their varied colour formed a charming bouquet, specially pleasing to those to whom the more formal flower of the "florist" type are not altogether satisfactory.

— HELLEBORES.—M. J. VAN DER SWAELMEN, The Lily Nursery, Ghent, has sent us a box of flowers of his collection of Hellebores, which he remarks have never been so fine as they are this year, the weather having so far been exceptionally favourable. We may add that they are very early. They are a very interesting series, but as they are sent without names or numbers we are unable to particularise; in fact, from the gradations of forms and colours it is not improbable that they may be the produce of a bed of seedlings. We do not find anything novel amongst them. One of the more interesting resembles *lanogens* in its large greenish-yellow flowers; a greenish-white with very even bell-shaped flowers comes near to *antiquorum*; *orientalis* is represented by various shades of pinkish-white and purplish-green, and there are some darkish purple bell shaped forms which for decorative purposes are the best of the series, and appear as if intermediate between *colchicus* and *atrobunus*. Besides these there are other types with greenish flowers, of little merit as ornamental plants, and there is a set approaching the free-blooming *lividescens*. As early-blooming hardy plants a good selection of Hellebores should find a place in every garden, for though they lack brilliancy they are full of interest.

— LINNEAN SOCIETY.—At the meeting to be held on Thursday, 19th January, at 8 P.M., the following papers will be read:—1. "Life History of a *Crocus*, and Classification and Geographical Distribution of the Genus;" by GEO. MAW. 2. "Asteroida of *Challenger Expedition*;" by W. PERCY SLADEN. 3. "Stamiferous Corolla in *Digitalis* and *Solanum*;" by the Rev. GEORGE HENSLAW.

— ANEMOMETERS.—The Council of the Meteorological Society have determined upon holding an exhibition of anemometers at the Institution of Civil Engineers, 25, Great George Street, on the evening of March 15 next, and the committee are anxious to obtain as large a collection as possible of various patterns of anemometers, either full size, models, photographs, or drawings. Special interest will attach to all apparatus bearing upon the history of anemometers and to their modification and improvement. The committee will also be glad to show any

new meteorological apparatus invented and first constructed since the last exhibition.

— **BOUVARDIA ALFRED NEUNER.**—Messrs. J. CARTER & Co. state in the *Field* of Saturday last, with regard to the propagation of this beautiful novelty, that they have been informed by Messrs. NANTZ & NEUNER, the raisers, that cuttings must only be taken from the *leading shoots*. If any other course is followed, when the plant flowers they will prove to be single. Messrs. CARTER & Co. have themselves made the experiment with this result.

— **MARKET GARDENS.**—What a marvellous contrast is that now presented in market gardens as compared with their aspect at this time last year. Then

and there is revived by the occasional gleams of sunshine that glint across the expanse and infuse light and cheerfulness in an unwonted wintry manner. But even brighter than this picture is the abundant employment which the open mild season furnishes to myriads of workers who might otherwise be starving on the bread of idleness. Pruning, manuring, digging, and hoeing are going on in every direction, for the frost has not yet killed the weeds, and where, as amongst winter Onions and Lettuces, they cannot otherwise be disposed of, they must be cut out with hand-hoes, in the use of which women are so expert. The plethora of rain, which before Christmas boded a ground flood, has passed away, and the soil, except on very stiff lands, is fairly workable, and therefore early Pea sowing is going on

they are quite exceptional. From a series of experimental trials, now ranging over several years, Messrs. HURST & SON are convinced that home-grown seed is most economical to the farmers even taking into consideration the usual difference of price of home-grown over foreign-grown seed; and the present scarcity at a time of severely felt agricultural depression, is a matter for great regret. In respect of foreign red Clover, the best samples come from Canada, very clean, fairly bold, and of deep colour; some parcels from the North of France, and as the produce most nearly approaches home-grown seed in quality of growth and hardiness, a considerable demand is expected for it. The American seed is pale and small, and though some red Clover will be forthcoming from Germany

FIG. 7.—HARRINGTON HALL, ESSEX. (SEE P. 55.)

intense frosts prevailed, the earth was deeply locked in the frost's cold embrace, the vegetable crops were being withered, blasted and killed on every hand; and the fiercest winds that humanity here has perhaps ever had to endure were sweeping over the earth, carrying death and destruction everywhere. It was an arctic season; and for the time England was the region of desolation and gloom. Now, as though by the touch of some enchanter's magic wand, the scene is changed. The winter is here, but its bitterness is absent. Over gardens and fields the crops are rejoicing in life, growth, and the most refreshing hues of colour. Literally the "greens" are beautiful. The varying shades presented by the deep-hued sprouting Broccoli, the heavily-tinted Savoys, the paler-hued white Broccoli and white Cabbages, and the still lighter greens of Turnips and Cabbage Lettuces, all serve to make up quite a charming picture that here

apace, and vacant spaces are being got ready for early Potatoes, later sowings of Peas, and Broad Beans. It is true vegetables are not fetching high prices in the market, but at least there is plenty to take in, and the labour of gathering is trifling. We have seen much worse times for the market grower than the present are.

— **CLOVER AND GRASS SEEDS.**—In a special circular just issued by Messrs. HURST & SON, of 152, Hoandsditch, E.C., we get some idea of the extent and quality of the past harvest of Clover and grass seeds set forth from the English standpoint, after the fullest information respecting foreign crops has come to hand. Of English red Clover, a deficient yield is reported, and a lower grade of quality than has been experienced for several years. The Eastern Counties have supplied the boldest and best coloured seeds, but

it is not much in favour in England on account of its being of a weedy character, and should never be used unless first cleaned in a machine. Of white and Alsike Clovers, a larger quantity than usual was secured in this country during the fine weather of the early summer, but the main supply will have to be drawn from the Continent, and as both these articles are produced over a wide range of country the extent of the crop can scarcely be accurately stated until the cold weather sets in, so as to allow of the threshing and marketing of lots, but it is expected there will be quite an average crop. The English crop of Trefoil is again much below the average, but fortunately France will be able to send some fairly good lots. French seed grown upon the chalk is hardly inferior to home-grown, and for years past large quantities of French seed in the cask or hulk has been sent over to this country, milled here, and sold as English.

Lucerne is reputed to be a short crop, but prices are not reaching very high. Of Sainfoin the English crop of Giant is quite a failure; but some common will be forthcoming from the Southern Counties. The French crop of Giant is a very small one, and prices will be high throughout the season. The French crop of Italian Rye-grass is not up to the average; the quality of the seed, however, is better than for several seasons. Owing to the fact that nearly all yearly stocks have been cleared out, a considerable advance upon last year's prices has taken place, and prices may range still higher. The best French-Italian comes from the cleanest farmed land in that country. The English crop is the smallest for some years, and is now entirely out of the farmers' hands. Perennial Rye-grass is at about the highest price it has touched for many years; following the entire clear-out of stocks last season, a great demand set in as soon as the crop was harvested, both from this country and from the Continent; and as so much has yet to be bought, there is every probability the high rates will be fully maintained; the lower weights are pretty certain to increase in value, as almost prohibitive prices are asked for the heavier ones, and the demand will naturally be for a cheaper quality. Natural grasses are scarce, and generally above average prices, but are very good in quality; indeed, this applies to all kinds of grasses this season.

— THE METEOROLOGICAL SOCIETY. — The annual general meeting of the Society will be held at 25, Great George Street, Westminster, on Wednesday, the 15th inst., at 7 P.M., when the report of the Council will be read, the election of officers and Council for the ensuing year will take place, and the President will deliver his address.

— THE FALLEN TIMBER AT DUNSE CASTLE.

— Sixty of the fine old trees blown down here during the gale of October 14 last having been replanted by Mr. SHEARER, of Edinburgh, by means which were described in our number for November 10 last, the proprietor of the estate, Mr. HAY, entertained the workmen, thirty-eight in number, with a dinner, on the 8th inst., at the Swan Hotel, Dunse. The chair was taken by the factor, Mr. FERGUSON, who was supported by Mr. SHEARER and Mr. JOHN DOWNIE, and it need scarcely be added that the kindness of the Laird was much appreciated. The remainder of the fallen timber on the estate, estimated at over 50,000 trees, has been sold to Messrs. BROWNLEE, Earlsdon, who engage to remove it within four years, the purchasers being allowed to erect saw-mills on the estate to cut up the timber.

— HORTICULTURAL CLUB. — The annual dinner took place on Tuesday at the new rooms of the Club, 13, Henrietta Street, Covent Garden, Mr. JOHN LEE in the chair. There was a large attendance of members, and the new arrangements, necessitated by the dissolution of the Temple Club, were much approved, and it was hoped that now that country members can claim bed-room accommodation in the house at reasonable charges the number of members would be increased. Mr. LEE, in proposing the toast of "Prosperity to the Club," remarked on these points, and it was stated by the Secretary that although the number of members was not as large as might reasonably be expected, yet the committee had been enabled to increase the funded property, and to leave a good balance in hand at the close of the year. Several new members were admitted.

— WATSON'S "TOPOGRAPHICAL BOTANY." — The last work of the late Mr. H. C. WATSON on the distribution of British plants was his *Topographical Botany*, issued in 1873-74, in which he traced the dispersion of each species through the 112 viccounties which he adopted. Of this book only 100 copies were printed for private circulation, and these were all given away by the author immediately. Since its issue a large amount of new material has been accumulated, principally through the exertions of the members of the Botanical Record Club, and at the time of his death last autumn Mr. WATSON was engaged in the preparation of a new edition. This he did not live to complete as regards its prefatory and explanatory portions, but he had kept an interleaved copy, in which he regularly entered up every record of the occurrence of any plant in a new district that was brought to his notice. At his own special

request, this was deposited along with his herbarium at Kew, and from this it is now proposed to prepare a second edition of the book, which Mr. QUARITCH has undertaken to publish, and Mr. J. G. BAKER and the Rev. W. W. NEWBOLD to make ready for the press.

— BIGNONIA VENUSTA. — At Foyles Park, near Alton, Hants, there is at present a gorgeous show of this grand climber trained on the roof of a stove. On January 6 there were hundreds of trusses of its beautiful bright orange flowers. Mr. HARRY COSTER, the gardener in charge, states that he has cut many dozens of trusses from it and it had been in flower some considerable time, proving it to be a most valuable plant for such a position, and flowering through the winter months, as seen here, makes it very valuable. In Sir GEO. MACLEAY'S garden it is also very fine. We gave a figure of it at p. 273, vol. XI.

— BIFACIAL ORANGES. — In the *Provence Agricole* M. HECKEL tells us how the fruits which on one side present the characteristics of Oranges, and on the other those of Lemons, are produced. A nurseryman at Cannes, M. TORDO, takes scions (*bourgeons*) of various species of Citrus, Orange, Lemon, &c., and grafts them circularly around the trunk of a Citrus, arranging the scions closely together in pairs so as to bring about complete fusion of the scions. When the grafts have adhered the tree is headed down to within a short distance of the grafts, and in spring branches are seen which give rise to monstrous fruits, having the characteristics of the different grafts blended together. The branches which originate from the ingrafted shoots produce leaves which are greatly changed in form and differ from those of either species, thus affording a striking proof of graft-hybridisation. The flowers of the two species are also fused.

— JACARANDA MIMOSIFOLIA. — The elegantly cut leaves of this stove shrub are so much like those of a Fern that nine out of ten passers-by would at the first glance declare it to be a Fern, although in truth it is very far removed from Ferns. It is generally considered difficult to propagate, but Mr. B. S. WILLIAMS has, it seems, discovered the knack of accomplishing the task without material difficulty.

— GERMINATION. — M. PAUCHON has been experimenting on the relative time required for germination by variously coloured seeds of the same kind under the same conditions. As the light can only influence the embryo of the seed by traversing its coverings, and those coverings vary in colour and thickness, so it is not unreasonable to expect differences in the rate of germination accordingly, and M. PAUCHON shows that this is so. Black Haricot Beans, placed under the same conditions as white ones, germinate less rapidly than the white ones, and absorb more oxygen.

— IMPORTED LILIES OF THE VALLEY. — Some very fine beds of these charming Lilies are now in full beauty in the Grove Nursery, Teddington, where large quantities are annually forced by Messrs. H. PAGE & SONS. The roots are put thickly in rows in beds with plenty of bottom-heat, and covered with e-ozia-fibre. Sashes are then placed over the bed until the flowers appear, when they are removed and the flowers are gradually exposed to light. From the time the roots are put in until the flowers are cut generally takes about six weeks. Whatever objection may be taken to imported roots as being more difficult to force than home grown plants, it is certain that in point of quality the imported roots produce by far the largest flowers. Those who think differently should compare results. With Messrs. PAGE a crown has not mislaid (of course the crowns have been selected), and the result is a very profitable display of unusually large flowers. As with everything else, so with Lilies of the Valley—the largest and finest spikes bring the most money.

— JASMINUM GRACILIMUM. — Of this there are three or four large specimens in Messrs. VEITCH'S nursery, which will continue in bloom for a long period yet; as a succession of bunches of delicate white flowers are freely produced from the axils of the leaves. The numerous examples of small plants are also flowering. One may safely predict of this that it will soon be grown in every garden. The

bushy habit of the plant, and the penulous character of the branches, which seem to droop with the weight of its sweetly-scented flowers, form altogether a very handsome specimen.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION. — At the annual meeting of this Institution, held on the 12th inst., Mr. Deputy RUDKIN in the Chair, the report of the committee for the past year was read, and a financial statement, duly audited, laid before the meeting. The total receipts during the year amounted to £2734 6s. 10d. The pensions to the amount of £1200 13s. 3d. were paid, £650 had been invested, leaving a balance in hand of £1441 14s. 10d. The percentage of expenses to receipts (19.5) was considerably less than in some former years. During the year there had been 1113 subscribers and 766 donors. The number of pensioners last year was forty-two females and forty-three males, the following eight additional pensioners being added to the foregoing at this meeting without the trouble and expense of canvassing, all having complied with the rule that they or their husbands shall have been subscribers for at least five years:—John Bowen, of Southampton; John Baxton, of Eltham, Kent; Margaret Eagles, of Highgate, Middlesex, relict of the late Abraham Eagles; John Hinde, of St. Mary Cray, Kent, totally disabled; Alice Meldrum, of Kendal, Westmorland, relict of the late James Meldrum; Abraham Randall, of Colebrook, Comptonstone, North Devon; Ann Helen Tilley, of Welbeck, Notts, relict of the late William Tilley; Benjamin Wortley, of Camberwell, Surrey. The scheme for augmenting the amount of the annual pensions, admittedly very low, had produced a net sum of £500, obtained chiefly in small sums from working gardeners by means of applications made by gardeners and others. The sum is to be invested separately, and any interest that may accrue is to be added to the principal, so as eventually to secure the desired result. The scheme has been the means also of securing a considerable addition to the subscribers, and is to be carried out again during the ensuing summer. The negotiations with the committee of the Henry Veitch Memorial Fund are still in progress. It was announced that the Lord Mayor would preside at the next anniversary festival. A discussion arose on certain points of detail, and the proceedings, which were of a satisfactory character throughout, were closed by the usual vote of thanks to the Chairman.

— THE WEATHER. — General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending January 9, issued by the Meteorological Office, London. — The weather has been dull and unsettled, with frequent falls of rain. In some places hail or sleet showers were experienced, and at some of our extreme north-western stations thunder and lightning. The temperature has again been above the mean in all districts, the excess varying from 1° in "Scotland, E." to 5° in the Midland Counties. The maxima were generally registered on the 5th or 6th, and varied in most districts from 53° to 55°, but at Nottingham on the latter day the thermometer reached 60°. The rainfall has been a little more than the mean in all districts except "England, N.E." and "England, S." Bright sunshine shows an increase over the greater part of England and the east of Scotland, but a decrease elsewhere. The percentages varied from 15 in "Scotland, W." to 35 in the Midland Counties, and 49 in "Scotland, W." Depressions observed:—During the whole of this period the barometer has been highest over France, and lowest in the western and north-western parts of our area. Several depressions have passed over us in a north-easterly direction, some of them, notably that of the 6th, being deep. The wind was generally moderate or fresh from south-west or west, but increased at times to a gale on our western and northern coasts. The gale experienced over Scotland on the 6th was exceptionally severe, and at Ardrossan is reported to have reached the force of a hurricane.

— GARDENING APPOINTMENTS.—Mr. M. K. DIXON, for upwards of three years Gardener to Capt. TAYLOR, Glenleigh, Hastings, has been appointed Gardener to Sir S. M. WILSON SEARLES, Uckfield, Sussex; and Mr. J. GORE, for the last four years with Mr. WARD, Gardener to T. H. OAKES, Esq., Ridings House, Dalrymple, has been appointed as his successor at Glenleigh.—We hear that Lord BROWLOW is giving up the kitchen garden at Ashridge, and that Mr. SAGE, in a few weeks will take charge of his lordship's garden establishment at Belton, near Grantham; the present gardener at Belton becoming flower gardener at Ashridge.

BARRINGTON HALL,

THE residence of G. Allan Lowndes, Esq., is situated in one of the most charming districts in Essex, some 5 miles from Harlow, and 3 miles from Tackley station, on the Great Eastern Railway. The neighbourhood is rich in places of antiquity, and the village of Hatfield Broad Oak [not to be confounded with Hatfield, the seat of the Marquis of Salisbury] is about as quaint a relic of the habits and customs of our forefathers as one could well desire to see. The church at Hatfield was of very early foundation. Earl Harold had an extensive manor in Hatfield, which came to William the Conqueror, who granted the church and part of the tithes to Aubrey de Vere. The Barrington family appear to be of very early origin. From the history of the Barrington family, edited by G. Allan Lowndes, M.A., it appears the family, though now extinct, was a very ancient and prominent one in the county. The family were originally settled at Barrington, in Cambridgeshire, to which place they either gave their name or from which they took it. In a M.S. account of the Barringtons, written about the year 1677, it is stated:—"It is the greatest honour and happiness of this family that it embraced the Christian faith upon the first preaching thereof here by the English apostle." Touching the antiquity of this family we find one of the Barentons servant to Queen Emma, wife of King Ethelred, and mother of Edward the Confessor. Randalphus de Barenton, probably son of the above, was one of those sworn by William the Conqueror to assist in taking the general account of the kingdom. He was employed in Cambridgeshire, and made the return for the hundred of Trepe-law (now Triplop) in that county. Morant states from the feodary of the De Veres, Earls of Oxford, how a long list of persons of the name of Barenton held the Manor of Chigwell under them, and proceeds to give the genealogy from 1263 to 1479.

Camden, in his account of Essex, in the *Britannia*, after naming Hallingbury says, "And more to the east is Barrington Hall, the seat of the noble family of the Barringtons, who in the time of King Stephen were greatly enriched with the estate of the Lords Montfichet that then fell to them, and in the memory of our fathers a match with the daughter and heir of Henry Pole, Lord Montague, son and heir of Margaret Countess of Salisbury rendered them more illustrious by an alliance with the royal blood." Sir Thomas Barrington succeeded to the estates in 1628, and was a great favourite with Charles I. Sir Fitzwilliam Barrington died in 1836, and on his death, leaving no male issue, the baronetcy and family of Barrington in the male line became extinct.

Since the present owner came into possession extensive additions and improvements have been made on the estate, not the least of which has been the formation of new gardens and grounds, which have been designed and executed with great skill and much good judgment. No incongruities appear to offend the eye, and the wings of the grounds (if I may so write) are so happily balanced, and in such strict proportion to the centre that one might almost conjecture it to be a lady's arrangement. And so it was, for Mrs. Lowndes is a real gardener at heart, and is ever ready to impart advice and encouragement to those who have to bear the burden of the work. The principal entrance is off the Dunmore road leading to the north front, and is but a short distance from the village of Hatfield Broad Oak. The avenue is lined with Elms, bearing marked traces of a ripe old age, and in striking contrast are healthy Wellingtonias, Pinus insignis, and other Conifers, planted in vacant spaces some distance from the Elms. The first curve in the avenue brings the visitor within view of a huge amphitheatre of trees, almost forming a circle, which narrows gradually into a long plantation, stretching northwards as far as the naked eye can travel. And in an opposite direction in the park are some pretty groups of Sycamores and Ash, and some fine old Elms standing singly by themselves.

Nearer to the Hall, and within view of the windows, are some grand Chestnuts towering above healthy plantations of young trees, and by the side of the drive stands the old plant Oak, the girth of which is 30 feet in circumference at 2½ feet from the ground—the largest Oak that has come under my notice except the one at Witley Court, which measures 8 feet more. This patriarchal tree has fourteen main limbs, and

like the one at Witley, is more interesting from its age and size than from its appearance, which is the reverse of handsome. The knots and excrescences upon the bark, the thinness of the leaves, and the annual diminution of growth forecast but too plainly the lack of vital force in the noble old tree that has weathered the storm of many generations. The view to Tackley and Hollenbury Forest are the chief landscape attractions from the north front, which are closely rivalled by the scenery of the home park. The Hall is a handsome square block of modern style, commanding wide and pleasant views of the surrounding country in clear weather. In the direction of Hatfield Broad Oak the view extends to a distance of 20 miles straight upon a clear day. This view is from the south front, and several other beautiful peeps take the direction of Down Hall; nor must we forget the spire of the village church, distant about a mile and peeping conspicuously above the trees in the subdued evening sunlight—nor the splendid green drive, a mile in length, of which more anon, bordered by rows of Beech, and Limes, and Sycamores—nor the distant lakes surrounded by noble groups of trees.

What a grand appearance these fine trees have when the leaves take on their various autumn tints!—when every rainbow tint is represented, and the golden sunlight is reflected upon them through a dense background of green. Such picturesque effects—such beautiful contrasts of light and shade, all derived from a happy arrangement of trees and an acquaintance of their different forms and colours when planted. The west and north-west views are also extensive, Beech, Elms, and Chestnuts being again conspicuous in single specimens and in groups. Upon the east side of the flower garden in the park are several specimen Oaks, 21 feet in circumference at 6 feet from the ground. Groups of Oaks are also noticeable, but the single specimens are ornaments of which any country gentleman will head well pleased, with clear stems of from 5 to 6 feet and heads symmetrical as if they had been mechanically trained. The green drive alluded to runs in a direct southerly direction from the Hall, and has a massive effect from a distance. It is a practical illustration of the wisdom of planting trees at a considerable distance from the margins of avenues. How many avenues are there in England where the trees smother themselves in twenty or thirty years, and so defeat the original idea of the planter?

At Barrington there are green borders between the avenues and the trees from 3 to 4 yards wide, so that the visitor passing up and down has every opportunity of admiring their individual size and proportions. When half the distance is traversed a large circle is described, which makes a nice break in the drive, and round which carriages in waiting may promenade in the order of succession. On the south-west side of the park are rows of Limes of fine shape and other groups of trees in greater or less variety, but all in the best of health. On the east side of the park, or rather east from the Hall, are some splendid Oaks, 25 feet in circumference at 6 feet from the ground, with over twenty main limbs drooping over the greensward, with as much regularity as a distended umbrella. There is a clear walking space of over 9 feet between the branches and the surface of the ground. But the great curiosity of the park, or rather the most interesting object in it, is the "Fox's Elm." The peculiarity of this notable tree is that one of its branches touches the ground near its extremity, the point of the branch taking an upright turn immediately after the curve in the branch which rests upon the ground. When Reynard is hard pressed he, fox like, takes to scheming when he finds that a straightforward run for his life becomes dangerous. His plan is to climb up this branch and secrete himself in a large cavity in the centre of the tree and the bounds once having lost the scent leave Reynard undisturbed until hunger tempts him voluntarily to leave his ambush. The girth of this tree is 25 feet in circumference at 6 feet from the ground.

The flower garden and pleasure grounds are upon the south front, the latter taking a gentle sweep to a fine lake which extends as a boundary from south to east, in other words the lake divides the private grounds from the park proper. Descending the steps from the Hall there is a broad terrace walk. The flower garden consists of a large plot in the shape of a half circle traced in grass in front of the Hall steps. In the centre of the plot is a large figure in statuary surrounded by a neat oval design in Box; then a walk

of proportionate size between the group of figures and the grass and a row of flower beds cut out in the grass terrace of suitable size and shape. Upon the right and left of the central group two scroll designs in Box to match are laid out the full length of the terrace; thus it will be seen that a summer and winter effect is aimed at, the garden being laid out in about equal proportions of grass and Box, the latter so happily balanced and so neat and effective in design as to give a very lively winter effect from the principal windows of the Hall. The long walk leading from the flower garden to the lake is adorned with a massive figure of Hercules. The groundwork round the figure is diamond-shaped, and of course the walks, as a consequence, are of the same shape. Four appropriate figures are cut out in the grass opposite the four sides of the diamond figure for flowers, and large shrubby beds are cut out in the grass a little further off; these beds are beautified with flowers as well as shrubs. From this point the lake has a rectangular appearance, and the rather quick slope down to its margin would make a fitting place for Iris, Epilobiums, and many other tall-growing herbaceous plants requiring a moist situation. Banks of trimmed Laurels face the lake, which are not good enough for the situation. On the east side of the enclosed grounds stands a Weeping Willow, the first tree planted on the place by Mrs. Lowndes. It is near to the bridge which spans the watercourse, and not far from it is another of those fine Oaks which are the especial feature of Barrington; this tree is 26 feet in circumference.

Of isolated objects a figure upon the west lawn, in which carpet-bedding is successfully done, struck me as supplying a good way of making distinction in the different systems of summer bedding. Of Conifers and other trees worthy of mention in the pleasure grounds are Wellingtonia gigantea, Abies Pinsopra, Pinus excelsa, Taxodium sempervirens, Cryptomeria japonica, Andromeda floridula, Thuipius borealis, Abies lasiocarpa, and a grand Cedar of Lebanon by the east corner of the house, which is a conspicuous object to visitors, and an ornament to the grounds. I should also mention a group of fine Elms on the east of the Hall which appear to be of great age, and wonderfully furnished, though somewhat lacking in health from what they have been in years past. In the glass structures the plants are exceedingly well done; every house has as much as it can hold, and more, all well cultivated, clean, and healthy. Plants for house furnishing are grown in numbers, flowers and Ferns for cutting, and lots of odds and ends as a reserve stock for general purposes. In the plant-stove, Stephanotis and Alimandaras had flowered freely; Abutilons, trained as climbers, gave the idea of midsummer rather than of October, and pots of Eucharis were showing flower, as well as hosts of flowering Begonias and other plants. The occupants of this house are miscellaneous, such as Aralias of sorts, Palms, Ferns, a fine specimen of Asplenium Belangeri, Dracaena rubra and congesta, and of those requiring more warmth, D. Shepherdii, Cooperi, terminalis; Orchids of the useful type, Tydasia, Anthurium magnificum and Schzerianum, Cissus discolor, Amaryllis coming into flower, Eranthemums, Ixoras of sorts, Clematisdrum Thomsoni, Euphorbia, club mosses, Selaginellas, &c. Thunbergia elegans is grown as a pillar plant, and a handsome one it is for winter or summer use.

In a large span-roofed greenhouse, shelved under the apex and at the sides, hundreds of Primulas and Cyclamens were coming into flower, and others for succession. Chrysanthemums, green bush fashion, a nice sample of the Bird's-nest Fern, Nootopterisindis, Richardias, Solanums, Felargoniums for winter flowering, hard-wooded Heaths, Aspidistra laudata variegata, Imantophyllum miniatum, Camellias in pots, Cobaea scandens, Abutilons, Cytisus, Carnations, Azaleas, Nerium Oleander, Grevillea robusta, and many others. In pits and frames I noticed healthy stocks of Cinerarias, Primulas, and other plants for spring flowering, the Cinerarias with leaves like young Cabbages, and quite as green. The Grapes had already been cut and bottled—as fine samples as could be desired for table use, or by taking a lighter crop perhaps they would come in handy for another purpose. The kitchen and fruit garden is over 3 acres, and is clean and well managed. The fruit trees are in a fertile state, Pears, Plums, Apples, and small fruits are annually gathered in large quantities. Strawberries bear enormous crops. The soil of the garden is naturally adapted to the cultivation of vegetables, which never fail to be of the highest quality either in

summer or winter. The forced vegetables in winter must be very fine if one can form a safe opinion from an autumn appearance of (Kuhlarb) and Skakle crowns, and other roots for forcing. The garden is under the management of Mr. W. MacGregor, who is evidently at home in every department of his business. *W. Hinds.*

NOTES ON THE NEW NEPENTHES.

Your figure of *Nepenthes Northiana* was very good. Miss North's drawing, however, has, if I recollect right, a ground-tint of bright reddish-crimson on which darker blotches are laid. It is a fine thing, and, as I firmly believe, a natural hybrid between *N. sanguinea* × *N. Veitchii*. The oblique mouth of the urns would suggest *N. Rajah* as one of the parents, but then his highness only holds court, so far as we know at present, on Kina Balu, 250 miles farther north, and never at a less altitude than 4500 feet, rising to near 10,000 feet.

In earlier times he may have been an inhabitant of the plains—at any rate no one can place the pitchers of *N. Northiana*, *N. Veitchii*, and *N. sanguinea* side by side without being struck by their affinity. Again, a glance at your engraving of *N. Northiana* reminds one of a long-urned form of *N. Rajah* in obliquity of mouth and its wavy-margined frill. The *cauline* pitchers of *N. Rajah* have never yet been figured. I was with Mr. Harry Veitch when Miss North first showed him the picture of *N. Northiana*, and it was a revelation to us both. I had the latitude and longitude of its habitat in my portfolio when I left Chelsea for Borneo, but unfortunately never had the chance of seeing Sarawak; my lot was the wild north-west coast, among the pirate chiefs, and very good genial fellows I found them!

Now as to *N. Veitchii*. This is a true epiphyte. I never met with it on the ground anywhere, but in great quantity 20–100 feet high on tree trunks. Its distichous habit is unique, I fancy, and then some of the leaves actually clasp around the tree just as a man would fold his arms around it in similar circumstances. No other species of *Nepenthes*, so far as I know, has this habit.

N. sanguinea is a native of Borneo, although first found by Lobb on Mount Ophir, in Malacca. Of this there are green and crimson pitcher-forms, analogous to *N. zeylanica* and its red-pitchered form, sometimes called *N. rubra*.

No doubt exists in my mind as to *N. Hookeri* being a form of *N. Rafflesiana*. In Johore I saw typical *N. Rafflesiana* climbing to the tops of trees 50 feet in height. In Labuan Island *N. Rafflesiana* var. *nivea* is the form most commonly met with which has stems of satiny lutea, being covered with a felt of silvery hairs. Specimens in wet jungle in sandy peat climb up bushes like Sweet Peas at home. I never saw this form above 10 feet in height. The lower urns on plants, 15 inches high are often thirty to fifty in number and were covered by leaves, moss, and other wet *debris*, are of a fine crimson colour; the *cauline* pitchers exposed to the sun are soft creamy-yellow with pink spots. This development of the highest and brightest colour in the shade is a peculiar trait displayed by Pitcher-plants. Every Pitcher-plant I saw abroad produced its largest and richest-coloured pitchers when resting on the surface of the ground, and when completely covered up with moss, wet leaves, and other forest *debris*. I never thought of leaf colouring being developed in this way. Flowers and fruit I knew coloured fairly well in the dark, and so the deep rose-crimson tubers of *Ullucus tuberosus*, formerly, as we are told, the food of the Peruvian Incas.

To return to *N. Hookeri*, I have a letter from Mr. Thomas Lobb, written in July, 1877, in which he says the true *N. Hookeri* was not then introduced from Sarawak! *N. bicolorata* exists in Sarawak (*vide* Beccari's specimen in Herb. Kew), and I have thought since my Bornean journey that Lobb saw this species, and took it to be the true *N. Hookeri*, as he says it has globose self-coloured pitchers of a red-crimson colour!

Nepenthes Burdidgei, Hook. f. *JSSN*, is a lovely thing, as yet un-introduced: pitchers pure white, semi-transparent like egg-shell, porcelain-white, with crimson or blood-tinted blotches. Lid blotched and dotted with crimson-purple. It is a very distinct plant, with triangular stems, 50 feet long, and the margins of the

leaves decurrent. *N. Boschiana* var. *Lowii* grows along with it, and has pitchers 12–18 inches long, cylindrical, of a green colour, with purple blotches. These two, with the flagon-shaped *N. Lowii*, the red-pitchered *N. Edwardsiana*, and *N. villosa* (true), a lovely thing allied to *N. Edwardsiana*, but with a *N. Hookeri*-shaped pitcher, having an elegantly filled mouth. These five fine species, and the vivid crimson-purple pitcher-terrestrial *N. tentaculata* still inhabit Kina Balu, and beckon on the collectors of the future, having so far defied the efforts of the collectors of the past.

Then Beccari's singular *N. echinostoma* (*vide* Herb. Kew) is a wonderful thing, as yet un-introduced—indeed, I suppose unscanned by any save Beccari! The mouths of the urns remind one of the deflexed teeth of some gigantic moss of the Hypnoid section. Mr. Peter Veitch and I found *N. Rajah*, *N. Lowii*, *N. villosa*, *N. Edwardsiana*, all together on the sunny south spur, but in this order:—4000–6000 feet, *N. Lowii*; 6000–8000 feet, *N. Rajah*; 9000 feet, *N. Edwardsiana*; 9000–10,000 feet, *N. villosa*—a rounder and shorter edition of *N. Edwardsiana* in pitcher, but different in terrestrial habit, *N. Edwardsiana* being purely epiphytal on *Casuarinas*, *Dacrydiums*, *Rhododendrons*, &c.

Apart from these I found an intermediate between *N. villosa* and *N. Edwardsiana*, also epiphytic on *Casuarina*. This is, I believe, unnamed; if so, I should like it to be called *Nepenthes Harryana*. Now, if a dried pitcher of *N. Edwardsiana* be examined, the upper four-fifths of it will be seen to be membranous, the lower part leathery and hard; in *N. villosa* nearly all is hard and leathery except about half-an-inch below the hardened rim of the urns; in *N. Harryana* about one-third is hard, and two-thirds soft or membranous below the rim. The edge of the pitcher mouths in these three kinds is quite distinct from those of all others, as shown in my sketches.

N. Hookeri I once saw at Kew, and it reminded me of Mr. Taplin's American seedlings which Mr. Williams bought. Sir Joseph Hooker, in *Linna. Trans.*, vol. xxii, suggested that *N. villosa* and *N. Edwardsiana* might be forms of the same species. This is not so, however, they are quite distinct in zone on the mountain, and in habit of growth also, and in colour. Then *N. Harryana* is a hybrid no doubt, which shows they have distinct sexual characters. Among my specimens of *N. gracilis*—all, or nearly all, from Labuan—are many forms more or less distinct [differing also in the relative depth of the thick and thin portions respectively].

N. Rafflesiana is most variable, from the little silky-stemmed *N. R. nivea*, only a few inches, to at most 8–10 feet high, to *N. R. glaberrima*, 40 feet high, and with enormous urns. I found one variety quite near the sea on the Bornean coast of Lumbedam, opposite Labuan Island, distant to miles, and it had a winged prolongation of the midrib, *Ec.*, the parts between base of pitcher and point of leaf were winged.

Mr. Le Marchant Moore's *N. dyak* is of course only the *cauline* pitcher form of *N. bicolorata*.

N. zeylanica, of gardens, seems nearest to *N. phyllanthiflora*, analogous to that species as *N. Hookeri* is to *N. Rafflesiana*. It is certainly not in any way related to the Bornean *N. hirsuta*, if I did not mistake that species, which I compared closely with the description in *Prodrum*, when I found it on the top of all the dry Lernas hills. *F. W. Burbidge.*

PLANT PORTRAITS.

ANTHURUM SCHERZERIANUM VAR. HENDERSONI, *Floral Mag.*, t. 468.—A very fine variety of this handsome species.

LYSIOLOTUS SERRATA, Don, *Bot. Mag.*, t. 6538.—An erect, glabrous Gesneriad, with stalked, oblong acute, coarsely-toothed leaves, green above, and veins brownish beneath. The flowers are irregularly funnel-shaped, about 2 inches long, pale lavender coloured, with veins of a deeper colour. Subtropical Himalaya. Kew.

PELARGONIUM PRINCES STÉPHANE, *Revue de l'Hort. Belge*, October.—A zonal, with large very double rose-pink flowers; habit dwarf, free-flowering.

THYRSACANTHUS LILACINUS, Lindl., *Gartenflora*, t. 1054.—A stove shrub with oblong acuminate glabrous leaves and terminal spiked verticils of two-lipped flowers.

HOME CORRESPONDENCE.

Chorispora Greigi, etc.—Can any of your correspondents tell me how to get the seeds of *Chorispora Greigi* to vegetate? I have had seed sent me from various sources, and have sown it at all times of the year, but have never succeeded in getting a grain to germinate. I have had similar want of success with the two species of *Hesperochiron*. I have any of your readers succeeded in getting good plants of *Viola heckwithii* or *V. pedunculata* from seed? The seed which I sowed last spring came up freely, but the young plants all died off before they had attained any size. *H. Harpur Cross*, *The Rectory, Drayton-Bassham, Flint, 700.4.*

Plant Labels.—The Rev. C. Wolley Dod's contribution on this question is interesting and valuable. I should, however, like to have the experience of any of your correspondents with Box-wood labels for pot plants, or in any case where the labels had to be inserted in the ground. Last spring I used a number of Box-wood labels for seeds, sown in pots and pans, but to my mortification found that a fine fungus spread from the wood of the surface of the soil in a way that invariably destroying the delicate seedlings. I was obliged to remove the Box labels and substitute for them the common ones made of deal, which appeared quite free from the fault of their predecessors. The fungus also quickly caused the Box-wood to become spongy and rotten, greatly to my disappointment, as I had expected the Box-wood labels to be much more durable than the softer and cheaper deal ones. During the past season I have used the chrome-yellow paint for labels instead of white lead, being recommended to do so by a gentleman with whom Mr. Dod is probably acquainted. I have not yet had sufficient experience of it to know whether it is, as alleged, more permanent than white; but it is certainly much more convenient to keep in stock, being in the form of a dry powder, of which as small a quantity as is liked may be mixed for use at any time. White lead, I need scarcely say, must be kept covered with water or it becomes hard and useless. *F. W. Stanfield, Sale, Cheshire.*

Pastila.—In reply to your inquiry as to the way in which this sweetmeat is prepared, I may say that although the pastila is made in different ways, its manufacture is based on the admixture of the pulp of Apples with sugary matters (sugar, honey, fruit syrup) and Potato flour. Apples are selected which have not attained full maturity, preference being given to those which are a little acid. Generally it is the Anthony Apple which is the most used. Having cooked the Apples, the pulp is extracted, pounded in the mortar until it becomes white and homogeneous; honey, or sugar, or the extracted juice of Cranberry (*Oxycoccus*), or of the Service (*Sorbus aucuparia*), of *Cherries*, *Plums*, &c., with a little starch (Potato flour), are then added. The mass formed is placed in an oven at a gentle heat until it has coagulated and become compact. According to the way adopted in different localities the pastila is divided into many kinds, of which the most renowned are those of Nowogrod, Kjew, and Moscow. *P. Walkenstein.*

Mrs. Duffield's Portrait of *Odontoglossum Alexandræ*.—In your note in Saturday's paper on horticultural pictures at the Grosvenor Gallery, your critic says of the *Odontoglossum Alexandræ*, painted by Mrs. Duffield, "through an admirable watercolour drawing it fails to impress us as a first-class variety of the Orchid in question." It is only fair to say that for the selection of the subject I am responsible. Mrs. Duffield was staying with us, and I pointed out to her two varieties of *Odontoglossum Alexandræ* which visitors here considered beautiful while they were comparatively rare forms. We had a number of varieties out but these were selected. I agree with your critic that the most beautiful variety is the very large flowered mauve-tinted variety, but of this Mrs. Duffield had a beautiful picture last year in the Institute of a specimen with, if I remember rightly, sixteen flowers. *Gov. & F. Wilson, Heatherbank, Weybridge Heath.*

Canker in Apple Trees.—I must differ from Mr. Harrison Weir when he states that in his opinion Apple-tree canker is not the product of frost. I have seen evidence enough of the action of frost on Apple trees in this district to satisfy me that frost is the most potent agent in its production. There may be isolated cases where, as he mentions, canker appears on the young wood of the present season's growth, but it must yet be a most rare case, whether the canker is found in the wood or on the surface of the tree, for the canker is the cause of their presence. Sharp frosts seem to be peculiarly destructive to some kinds of Apples, and as their effects are found only in certain sorts, whilst others growing close by are entirely unharmed, it is evident that soils have little to do

with the matter. The obvious inference, therefore, is that the wood of some kinds is softer than is that of others, and therefore more subject to disruption by frost. That canker is simply the after-result of the disruption of the cellular tissue there can be no doubt. The cells are burst by the action of the frost, and decay results. The same thing is seen in a Potato, for if but a few of the cells be destroyed by the point of a fork the originated decay will spread over a large portion of the tuber. Insects might perforate and injure the bark, but all canker is deep seated in the wood. After the fierce hoar-frosts of three winters since canker was suddenly found in hundreds of trees that up to that time had been perfectly healthy—even in large branches and in main stems. King of the Pippins and Wellingtons suffered terribly, and yet both had been esteemed before perfectly healthy and hardy. The kinds most injured with me were Gloria Mundi, Lord Suffield, Harvey Codlin, and Northern Spy. All others were uninjured. It is worthy of remark that all through the market orchards where the trees were not absolutely killed they are growing out of their injuries fast. Eight years since I had here a fine healthy Ribston tree that bore heavy crops of fruit. With the advent of colder summers it cankered and went to the bad, and I cut its head clean off. It has now made splendid growth for two years, and not a trace of canker is visible. A. D.

Aralia Sieboldii.—The hardness of this noble plant appears to be doubted in some quarters, and more's the pity, for it is an ornament at any season of the year, but especially in winter, when trees are leafless, and there are few plants with such noble green leaves that will live in our climate out-of-doors. The grounds of its supposed tenderness have not been stated, but I have read something about its being hardened off. Hardened off! Why, it is harder than a common Laurel. If people have been growing it as a tender exotic it is, of course, necessary to harden it off, but otherwise no apprehensions need be entertained by any one desiring to use it as a pleasure-ground plant. A group of *Aralias* have been standing near the "Grotto," in Sefton Park, Liverpool, for some years, and if the plant will stand a Lancashire climate with an occasional "whiff" from the alkali works at Widnes and Farnworth as a "refresher," I do not think it ought to live in most places without protection. I planted one in the open garden at Canford in the summer of 1880, and it was as fresh as paint after the winters of 1880-81, which are not yet forgotten, while common Laurels and other shrubs suffered severely. W. H.

The Weather: a Warning.—Soon after the troops of the Emperor Nicholas of Russia had been defeated at Inkerman, on Nov. 5, 1854, he was reported to have said, "I should soon have February in the field." General Canby and General Kearney, who would do more service for him than any had done yet," and he was not deceived. The winter in England was mild and stormy until Jan. 17, 1855, when a snowstorm set in which began one of the hardest and longest frosts in living memory. Within a week of that date I walked across the Thames between the Great Western Railway Bridge and Windsor Bridge, where it has never been frozen since. Soon after that skating began on the still reaches of the Thames, and lasted till February 21, which in that year was Ash Wednesday. Then the frost broke up, but we had many rude reminders of what the winter had been—especially on the night of June 10, on which there were 7° frost in my garden at Eton, and the Potatoes in the fields about London were killed to the ground. I do not believe in any prognostics of hard or mild winters, but what has happened before may happen again. C. Wolley Dod, Edge Hall, Malpas, Jan. 11.

Protection for Wall Trees.—Your correspondents, "G. R." and "R. C.," having opened the question of wall copings perhaps the notes I have collected at various times may be of service to some of your readers. To go at once to the root of the matter let us analyse some of the conditions required in protecting wall trees. Now a wall, especially if it be built at right angles to the line of greatest atmospheric severity, affords a certain protection to trees growing against it. We know, and it has been proved, that a purely vertical screen or screens decidedly afford a given amount of protection to trees growing in proximity to them; and an attempt has before now been made to utilise this idea by constructing a glass orchard composed of vertical screens only. But something more is wanted. Wall trees often require protection, not only from autumn rains, but also from late spring and autumn frosts. Again, the fruit when ripening may require protection from birds, wasps, &c. On the other hand, it may sometimes be advantageous, for the reception of summer dews, &c., to clear away every obstruction except the actual vertical wall which supports the trees. The obvious conditions, therefore, to fulfil in a wall tree protector are:—Cheapness (*i.e.*, comparative, not necessarily

actual low prime cost), extreme portability, durability, power of partial or entire ventilation, the least obstruction to solar rays, no skilled labour or excessive time occupied in erection, manipulation, or taking down, minimum risk of damage in removal or

FIG. 8.—RIVERS' WALL-TREE PROTECTOR.

storage. Permanent stone copings with additional temporary wood copings obviously do not fulfil all these conditions. Every wall built for the

FIG. 9.—RIVERS' WALL-TREE PROTECTOR.

reception of fruit trees should, first of all, be moderately coped; that is, it should possess a properly weathered and throated capping of stone or

FIG. 10.—WALL-TREE PROTECTOR.

other similar permanent and durable material; but this coping or capping should certainly not project more than a few inches at most. Underneath this may come a temporary coping, a favourite form of which, with many gardeners, is shown by the above

figure (fig. 8), representing a small portable glass roof, supported on brackets bolted to or through the wall. The roof may either be glazed in convenient lengths (in which case the danger of breakage of glass by removal and storage is reduced to a minimum), or the frames may be made to slide in grooves. In the former case the glazed frames may rest on the brackets at intervals, and be kept in their position by pins and slots. In the latter case the brackets and framework for receiving the glass may be jointed together. The front of such a glass coping may have hooks to receive tilting netting, or any other required protecting material. The dotted lines in the figure show a rather wider roof supported by posts; these posts may be so spaced that glazed vertical frames may be fitted or hung between them. In this manner the tree protection may be made to assume more or less the character of a lean-to glass building, and yet any part of it may be removed and stored away at a moment's notice without any trouble or skilled labour, and with no greater risk of breakage of glass than attends the storage of Cucumber lights. With such an arrangement as this, ample ventilation and protection from wasps may still be simultaneously effected. The figures 9 and 10 represent an interior perspective and front vertical section of an ingenious form of wall-tree cover, invented and registered by Mr. Rivers. The roof consists of grooved bars in which glass is slipped. For the vertical portion upright pieces of wood are placed at distances of about 24 inches apart. Horizontal and diagonal grooves having been cut, glass is slid in them between the uprights. If a small amount of ventilation be required the horizontal strips of glass are taken out; pieces of perforated zinc slipper in their places will prevent wasps, &c. entering. If the whole or part of the front requires to be open, as much of the glass as is necessary can be quickly removed, and as quickly replaced when required. My experience has taught me, however, that portable copings are but a makeshift after all, and that in the case of many of the more elaborate portable wall-tree protectors, however ingenious, with a trifling addition to the first cost, a more efficient, serviceable, properly ventilated, durable, permanent lean-to structure may be erected. F. A. Packes, Mansion House Buildings, Queen Victoria Street, E.C.

A Cornish Garden.—My garden is unusually backward this year, I believe in consequence of a sharp frost in October (15). There was another frost or two in November, and the week before Christmas 7° and 11° of frost; consequently the Snowdrops are only now just beginning to open in a very sheltered place, some not even yet. Primroses are out rather earlier than usual. I believe in consequence of a wet summer and very dry autumn. Fruit trees are not a bit forward, nor can I say that anything is so. The vernal Crocus are with us earlier than up the country; indeed, in flower many of them before Christmas—I mean the species: common garden Crocus is not up yet. *Anemone fulgens* is just beginning to open, but only one plant of it. I have no *Camellias* out yet, but *Lapageria rosea* still lovely in a very sheltered corner of my house. I wish I could convince my friends that this lovely plant is hardy. J. Troushand, Bonavan.

Rare Plants.—The *Monsonias* which Mr. Harpur-Crew inquires about were grown in the Hull Botanic Gardens a few years ago, but I doubt if any yet remain there: *M. ovata* and *M. speciosa* were the two kinds grown. *Erodium incarnatum* also was grown there. There are several plants I once knew well, which have almost disappeared from view; no doubt they may yet exist in some corner where their possessors are not aware of their rarity. I could mention a fine variety of *Dianthus hybridus* named *spendens*; a sad-looking *Larkspur*, *Delphinium triste*; Dabney's *Speedwell*, *Veronica Dabneyi*; the *Gladiolus segetum*; *Arenaria hispida*, *Dryas integrifolia*, *Saxifraga umbrosa* var. *Ogleviana*, and *Wulfenia Wallichii*. T. D. H., *The Gardens, Southwick, Buckley*.

Poinsettia pulcherrima.—Some very lovely examples of this fine winter flowering plant are now to be seen at Wroxall Abbey, near Warwick, arranged on the side stages in the conservatory, and being freely interspersed with *Richardias*, *Salvias*, *Carnations*, in the fine flower; *Cypripedium insigne*, *Mignonette*, *Maguerites*, *Libonias*, &c. are a most imposing and gorgeous sight for Christmas-tide. The plants are in large numbers, varying in height from 2 feet down to 6 inches, many of the bracts measuring 2 feet in diameter, of the most brilliant crimson, and with a healthy dark foliage, and are indicative of the highest culture, reflecting great credit upon the able head gardener, Mr. Henry Osman. Visitors to the Warwickshire county town will find these fine gardens well worth looking through. West York.

Euphorbia jacquiniiflora.—To get short useful plants for decorative purposes I find it the best plan

to strike strong cuttings rather late in 3-inch pots, 3 in a pot. I shift them into 6-inch pots when they have filled the cutting pots with roots, and pinch their points once. They then form nice bushy plants 15 inches high, and look bright and effective mixed with fine-foliated plants. *G. Wylex*, *Thirstiana* *Hall*, *Gardens*, *Cheltenham*.

The Soy Bean.—I am glad to see your notice of the *Soja hispida* or Soy Bean. My attention was first drawn to it by Dr. F. Watson as a most valuable article of commerce, owing to the large percentage of nitrogen it contains. It is grown largely in China, where an oil is expressed from it, which is used as salad oil, and the cake is then used as food by the inhabitants as well as given to cattle, and if in excess the cake is also used as a manure. The climate here, I believe, is too cold for it, but it might be grown in most of our colonies and become a large article of commerce. I tried to introduce it at the Cape, and also in Australia, but at that time without success: perhaps now people are wiser. The beans may be seen in the India Museum, and also a copy of the analysis of them. *R. Palmer, Brompton*.

Imantophyllum minimum.—Your correspondent, Mr. F. Corbett, of Fawley Court, writes approvingly of this plant in your last number (see p. 24), and recommends that it should be fully exposed to light in order to secure that deep orange colour which renders the flower-spikes so attractive. I have used the plant large for forcing purposes, and have never failed to obtain high colour in a forcing temperature, say, from 70° to 75°; but if it is allowed to flower in a cool house the flowers are, as your correspondent describes, pale and unattractive. *W. H.*

Berberis Aquifolium as a Hedge Plant.—To see this charming shrub planted *en masse* and in good health as it is now in the garden of Sir Robert Carden, and to see an isolated sickly plant of it in an ungenial soil one would almost fail to recognise the species, so great is the disparity between their appearances under different conditions. It is planted as a hedge in Sir Robert's garden at the back of a low wall where its bold leafage and clusters of yellow bell-shaped flowers are very conspicuous in the last days of December. *W. H.*

Notices of Books.

Wanderings of an Archaeologist amongst Old Churches in the Neighbourhood of Rhyll. By the Rev. W. A. Leighton, F.L.S., &c. (Woodall & Venables, Oswestry.)

Archæology is hardly one of the specialities of the *Gardener's Chronicle*, yet this little work deserves a word of notice from us as coming from the hand of so famous a botanist and lichenologist, not to say borticurist, as the Rev. W. A. Leighton, of Shrewsbury. A duality of studies is by no means uncommon amongst professional men, men of science, and even amongst artisans. One study is a relief from the other: what is more refreshing than to turn from the contemplation of a frail and fugitive fungus to a hard and imperishable stone? Mr. Leighton's work is illustrated with a couple of plates of doorways and stone-coffins, executed as carefully as if they were the anatomical parts of lichens. The first church described is that of Llanrhaidar-in-Ciunerch, bounded by Moel Ynamau, and perhaps this simple name will be enough for many of our readers, if we in conclusion say that the work contains detailed descriptions of the churches, brasses, stained glass windows, boxes, monuments, &c., near Rhyll. At p. 36, Mr. Leighton writes:—"A rough scramble over the high limestone mountain Coed yr Esgob, on which there is a small round tumulus, brought me to Gwynnosc." It is well known, that when Mr. Leighton, hale and hearty, scrambles over these high limestone mountains, he not only seeks out antiquities, historic and pre-historic, but he carries valve and hammer in hand for striking off lichen-covered fragments of rock. Mr. Leighton has for half a century occupied the same foremost place, as a lichenologist, as Mr. Berkeley has, as a fungologist.

Familiar Garden Flowers (Cassell) for this month contains figures of the Japan Quince (*Pyrus japonica*), a plant which, like a large number of garden plants, is encumbered with a large number of synonyms according to the various opinions held by botanists as to its position and qualification. In reference to this matter the editor tells a story of a creditor brought before the judge for non-payment of his debt—defendant repudiated the debt on the ground that his

name was incorrectly given in the documents. "That is of no consequence," said the judge; "you will do, you owe the money, and you will have to pay it;" and on similar grounds *Pyrus japonica hort.* will still answer quite well for garden purposes.

— **Familiar Wild Flowers** contains figures of the red Clover and of the common Coltsfoot.

— **Atlas of Botany.**—Messrs. W. & A. K. Johnston send us specimens of their edition of Dr. Arnold and Madame Carolina Dodel-Fort's admirable *Anatomical and Physiological Atlas of Botany*. These drawings are intended for use in the classroom, and are accompanied by a handbook translated and edited by Mr. D. McAlpine. We have before called attention to this excellent series, which no teacher will willingly be without. The bibliographical references given in some cases might with advantage be extended so as to include original monographs, and not merely accepted text-books, which of necessity deal with most matters at second-hand.

— **Caleb's Mechanical Almanac** (London: Heywood) is a cheap and useful manual for artisans, containing various tables likely to be useful in daily practice, together with articles on "Patent Laws," "The Apprenticeship System," &c.

— **Illustrations of British Fungi**, brought out by Dr. M. C. Cooke, now numbers its hundredth plate. Of the utility of this publication we have frequently had occasion to speak.

Reports of Societies.

Royal Horticultural, Jan. 10.—A finely grown specimen of *Lapageria*, another of Bignonia, and a Fern, *Lygodium Forsteri*, furnished the Rev. G. Heuslow with materials for remarks on climbing plants; how the method of climbing by twiners was a modification of the property of "circummutation" or "bowing around," a property of growth, and which occurs in all parts of plants, but which is variously utilised according to the nature of the organ—whether it be the radicles of seedlings, to enable them to find lines of least resistance for penetrating the soil; or runners, to aid them in surmounting obstacles; or stem-twiners, as in the above plants, for climbing. The lecturer called attention to other methods of climbing, as by tendrils in Bignonia, Vine, Pea, &c., pointing out that here, as is universally the case, Nature can utilise various organs for one and the same purpose whenever requisite.

Bad variation furnished matter for remarks in reference to a specimen of *Primula sinensis*, a double pink form called Lord Beaconsfield, in which had appeared a tuss of double white flowers, which had been called *White Lady*. The lecturer alluded to the *Chrysanthemum* as a plant particularly liable to sport, many new varieties having been thus raised before seed was procured (about the year 1855) from that plant. He alluded to the fact that Peaches may bear Nectarines, and *vise versa*, and that even a single fruit may be half Peach and half Nectarine. Variegated foliage, as in Laurel exhibited, may occur on another green plant; and it was the business of the floriculturist to fix these sports and establish them. The lecturer then alluded to variation from seed, as another method of raising new forms; illustrated by examples of *Azalea* shown. It often happened that seedling sports were not constant when again sown; but a variety of Chinese *Primrose*, of crimson colour, called Dr. Denmy, had proved to come true by seed with Mr. Cannell, who exhibited a specimen together with some nice examples of a new pinkish-white kind called Princess of Wales, which received a First-class Certificate. Another new variety, shown by Messrs. Carter, with an approximation to a blue tint, was also certificated.

As a remarkable illustration of a plant's power to resist what might be deemed injurious conditions, the lecturer remarked that *Lapsatia rosea* grows near arsenic and copper mines in Chili where other plants cannot thrive. He alluded to the fact that several plants imbibit salts of zinc (*Viola calaminaria*), copper, &c., but whether these metals were of any physiological value to the plants, or merely accidental, has never been determined.

SCIENTIFIC COMMITTEE.—Sir J. D. Hooker, K.C.S.I., in the chair.—At this, the first meeting of the year, an unusually large number of members were present, including several of those newly elected.

Lytocæus.—In reference to this insect, shown at a former meeting, male and female insects of 11. der-

mestoids were now exhibited by Mr. Pascoe, who stated that it was not itself destructive to wood, but preyed on wood-boring beetles.

Discoid Leaves of *Sobratia macrantha*.—Dr. Masters showed leaves of this plant from Mr. Douglas which had quite suddenly become entirely brown and rotten, the plant being in health one day—a ruin the next, without obvious cause, unless perhaps from an overdose of tobacco-water. Mr. Worthington Smith had been unable to detect the presence of fungus.

The leaves were reserved for further examination. ***Claytonia Thorn.***—Mr. Boscewan sent sprays of the *Glastonbury Thorn* from a graft taken from the original plant in the Abbey garden. The flower-luds were not yet expanded, this being the first year for several years in which the tree had not been in bloom on Christmas day. Fruiting sprays were also sent, to show that the opinion that this variety does not produce fruit is unfounded. Mr. Boscewan also sent a sport of the common Cherry Laurel, in which the leaves were variegated, in some instances completely white.

Potato Disease.—A letter was read advocating the notion that the disease was due to constitutional debility, consequent on mismanagement. The treatment recommended was to mix substances, such as sulphites, with the soil in which the Potato is grown, so as to destroy the fungus germ, and to treat the growing plant with flowers of sulphur for the same purpose.

Willow in Worm Casts.—Dr. Gilbert announced that since the publication of Mr. Darwin's work on earth worms he had collected a quantity of earth casts from his lawn, dried them to remove the water, and then determined the percentage of nitrogen they contained, comparing the proportion with that obtained from a sample of soil taken from the first 9 inches of the soil of adjacent pasture, and, percentage of .35 of nitrogen, which is higher than that of the ordinary pasture soil in the adjacent park, where the percentage proportion of nitrogen is .25 to .30. Thus the proportionate amount of nitrogen in the worm casts is higher than in the pasture land, and two or three times higher than in ordinary arable surface soil; but not so rich as in the highly manured soil of the kitchen garden. Ten tons per acre of worm casts would, it was estimated, supply about 80 lb. of nitrogen per annum—more than double that of ordinary meadow land without manure. It would appear then that there would be no absolute gain in nitrogen from the action of the worms, but that they would bring up from below a larger available supply, just as would be afforded by trenching.

Plants Exhibited.—Mr. G. F. Wilson showed a flowering bulb of *Tecophilæa cyanocrocea* and a plant of Iris Kolkopkowskyna. Mr. Harpur-Crew showed an unknown species, which was named by Messrs. Veitch and Cunnell as *Merenderia* or some longer slender tube, the incurved oblong segments being of a pale lilac colour, deeper at the base, and with leaves resembling those of *Scilla bifolia*. The plant had been obtained from the neighbourhood of Smyrna, along with bulbs of *Chionodoxa*. The plant was referred to Kew to be named. Dr. Fraser sent two dried specimens of *Willows* from Staffordshire, to the English flora, and which were supposed to be *Salix*'s or introduced species. One was *S. bicolorica* of Willdenow. Both were represented by male flowers only. Mr. Anderson-Henry sent a fruit of a *Carica* from Quito, supposed to be that of *C. cundinamarcaensis*. It was about the size of a goose egg, but angular, ribbed, and pointed at the extremity. *Columnea Kaluereyana*, elsewhere alluded to, was shown by Messrs. Veitch, and received, as was very appropriate, a Botanical Certificate. A like award was made to the General Horticultural Company for a pair of *Dioscorea Golden Wonder*, exhibited in flower for the first time. The handsome climbing Fern, shown as *Lygodium Hutcheri*, was referred by Mr. Moore to *Lygodium Forsteri*. Mr. Sander sent *Trichocentrum Pavi*.

FLORAL COMMITTEE.—The Rev. H. Harpur-Crew in the chair.—But few subjects came under the notice of the committee to-day, but being the inaugural meeting there was a good attendance of members. Messrs. Veitch & Sons again exhibited the new *Begonia Socotrana* and the equally new *Jasminum gracillimum*, both of which are very useful plants and much improve with acquaintance. The same firm had also *Amayllis Autumn Beauty*, a dwarf growing and pretty variety with an umbel of four flowers, which are of medium size, good form and substance, white ground heavily mottled with rose-pink; and *Lælia anceps* Veitchii and *Columnea Kaluereyana*, both of which were alluded to elsewhere. Messrs. Cannell & Sons contributed a dozen plants of a new Chinese *Primula*, named Princess of Wales, a very distinct and very pretty blush-white, which comes true from seed and is an unmistakably robust-growing and free-flowering sort. Also from Swanley came the now familiar stands of cut blooms of double and single zonal *Pelargoniums*, which, owing to the long-continued mild weather, were really superb; and

the original description of this plant, or even the name, in any work of reference.

PLAU or PLAVI. S. In converting the German Plau in the Latin form Plavus or Plavi in the genitive the *x* would naturally be replaced by *v*.

RED SPIDER: A writer in the *Pharmaceutical Journal* recommends the following method of getting rid of this insect, as well as other parasitical pests:—First prune the Vines, and then thoroughly wash them with a solution of pentasulphide of calcium.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

Markets.

COVENT GARDEN, January 12.

A good demand has sprung up for best late keeping Apples during the week, such as Hibernia, Wellingtons, and King of the Pygmies, consignments from America being few, and reaching us in bad condition. Grapes are selling badly, and showing signs of indiffernt keeping. James Hebler, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit and Price. Includes Apples, Grapes, Kent Cobs, Lemons.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable and Price. Includes Artichokes, Asparagus, Beans, Beet, Cabbages, Carrots, Cauliflowers, Egg, Fish, Celery, Cucumber, Endive, Garlic, Herbs, Horse Radish, Lentils, Lettuces, Onions, Parsley, Peas, Potatoes, Radishes, Rhubarb, Salad, Shallots, Spinach, Tomatoes.

Kent Regents, 10s. to 11s.; Roses, 8s. to 9s.; Myatts, 10s. to 11s.; Champions, 5s. to 7s.; Magnan Bonums, 9s. to 11s.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant and Price. Includes Aralia, Arabis, Begonia, Bouvardia, Cyclamen, Euphyllium, Eucyrtus, Ficus, Foliage Plants, Hyacinths, Lily of the Valley, Myrtles, Palms, Pelargoniums, Poinsettia, Primula, Salusmins, Tulips.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower and Price. Includes Abutilon, Azalea, Boscariads, Camellias, Carnations, Chrysanth., Euphyllium, Euphyllium, Fuchsias, Gardenias, Heliotropes, Hyacinths, Lisias, Lupagaria, Roses, Lilac.

SEEDS.

LONDON: Jan. 11.—More disposition to buy Clover seeds is now showing itself; for American red, especially, there is an improved demand, and rates are steady. The supply of new English Cow-grass continues exceedingly meagre. Trefoil, Alsike and white are firm. The recent advance in Italian Rye-grass is well supported. Higher prices are asked for spring Fares. Owing to the remarkably mild weather there is now less inquiry than usual for both Haricot Beans and Boiling Peas. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday the rates for English Wheat of Monday night were not notably exceeded, and sales progressed slowly; for American red, remained the same as on Monday last. Flour met a limited demand at previous value. Fine maling Barley was rather dearer from scarcity; grinding sorts dull on the spot. Beans and Peas were quiet and unaltered. Maize on the spot was rather dull; and Oats sold slowly at last Friday's rates.—On Wednesday the tone was in the Wheat trade, prices tending in favour of buyers. Flour remained without alteration in value. Maling Barley was firm, but grinding descriptions rather drooped in value. Maize was dull in all positions, and Beans and Peas quiet at late value. Russian Oats were rather easier. Average prices of corn for the week ending January 7.—Wheat, 44s. 9d.; Barley, 31s. 10d.; Oats, 20s. 3d. For the corresponding period last year:—Wheat, 43s. 4d.; Barley, 31s. 6d.; Oats, 19s. 10d.

CATTLE.

At the Metropolitan Market on Monday, without being annulled, the cattle trade was steady, and prices were, on the whole, firm. The trade in beasts was quiet, and prices about the same as last week. For sheep there was a steady trade, and prices were well supported. Calves and pigs were quiet, at late rates. Quotations:—Beasts, 4s. 15s., and 5s. 6d. to 5s. 2d. calves, 5s. 6d. to 6s., and 6s. to 6s. 4d.; sheep, 5s. to 5s. 6d. to 7s. 2d.; pigs, 4s. 6d. to 5s. 2d.—Thursday's trade was dull and inactive. Supplies were not large, but sufficient for the demand; and prices for both beasts and sheep were nominally the same as above stated.

HAY.

At the Whitechapel Market on Thursday there was a fair supply of hay and straw on sale. Trade was dull, especially for Clover, the prices for which were easier. Quotations:—Pruss Clover, 100s. to 115s.; inferior, 60s. to 95s.; prime meadow hay, 100s. to 126s.; inferior, 50s. to 60s.; and straw, 30s. to 54s. per load.—Cumberland Market quotations:—Superior meadow hay, 126s. to 136s.; inferior, 84s. to 108s.; superior Clover, 128s. to 136s.; inferior, 90s. to 108s.; and straw, 48s. to 56s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that moderate supplies of home-grown find a dull trade at the following quotations:—Kent Regents, 60s. to 100s.; ditto Champions, 70s. to 80s.; Essex ditto, 60s.; Scotch ditto, 80s. to 90s.; ditto Regents, 70s. to 110s.; Koscolf Blues, 100s. to 105s. per ton; German reds, 3s. 6d. to 4s. 6d. per bag.—The following are the imports into London during the past week:—1402 packages Hamburg, 400 packages St. Nazaire, 137 tons Dunkirk, 62 packages Alderney, 105 tons Portuguese, 24 packages Boulogne, 90 tons Prést.

COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 14s. 3d.; Walls End—Hutton, 17s. and 16s. 6d.; Hutton Lyons, 15s. 6d. and 15s.; Lamiton, 16s.; Original Hartlepool, 17s. and 16s. 6d.; Wear, 15s.; South Hetton, 16s. 6d.; Thornley, 16s.; East, 16s. 6d.; South Hartlepool, 15s. 6d.; Tees, 16s. 9d.

Government Stock.—Consols on Monday closed at 99 1/4 to 100 for delivery, and 100 1/4 to 100 3/4 for the account. On Tuesday the figures were, for delivery, 99 1/4 to 99 3/4, and 100 to 100 1/4 for the account. The closing quotations on Wednesday were, 100 to 100 1/4 for delivery, and 100 1/4 to 100 3/4 for the account. On Thursday the final figures were, for delivery 100 to 100 1/4, and 100 1/4 to 100 3/4 for the account.

THE

GARDENERS' CHRONICLE

Established 1841.

COMMENCEMENT OF A NEW VOLUME.

The Volume for the ensuing Half-Year will contain Articles on all Departments of

PRACTICAL GARDENING,

REPORTS and NOTICES on all HORTICULTURAL MATTERS of CURRENT INTEREST, HOME, COLONIAL, and FOREIGN CORRESPONDENCE.

Special attention will be given to the following subjects:—

ALPINE PLANTS. ARBORETUM—The. BEDDING PLANTS. BEES. BOTANY. BULBOUS PLANTS. CHEMISTRY OF PLANTS. CONIFERS. DISEASES OF PLANTS. EVERGREENS. EXHIBITIONS.—FERNS. FLORISTS' FLOWERS. FLOWER GARDENS.

FORCING. FORESTRY. FRUIT CULTURE. GREENHOUSE PLANTS. HERBACEOUS PLANTS. IMPLEMENTS.—INSECTS. KITCHEN GARDENING. LANDSCAPE GARDENING. LAWNS—LILIES. MACHINES. MANURES—Analyses of. MARKET GARDENING. NEMPHETHS.

ORCHIDS—including a complete List of those in cultivation. PALMS. PLANTING. PLEASURE GROUNDS. POMOLOGY. POTATOS.—POULTRY. RHODODENDRONS. ROCKERIES. ROSES. SHRUBS and SHRUBBERIES. STOVE PLANTS.—SOILS.

SUCCULENT PLANTS. TOWN GARDENING. TRAINING. TRAVEL—Notes of. TREES—Deciduous and Evergreen. VEGETABLE CULTURE. VEGETABLE PHYSIOLOGY. VINES. WALKS.—WALLS. WEATHER.—WEEDS. WINDOW GARDENING. WOODS, &c., &c., &c.

Illustrations by W. H. FITCH, F.L.S., W. G. SMITH, F.L.S., and Others.

For descriptions of the above and other Select and Genuine SEED POTAGES, or PLANTING, and GARDEN REQUISITES, see our Illustrated Vegetable and Flower Seed CATALOGUE, which may be had free on application.

DICKSON & ROBINSON, 12, OLD MILLGATE, MANCHESTER.

Another Novelty of Rare Excellence HARRISON'S

NEW MARBLE TURNIP.

We have much pleasure in introducing this excellent new variety, which is of a most tender and fine quality, and will bear washing and rough treatment in sending to market, and will not turn dark in the skin, which is so common with ordinary Turnips.

Once Packets, 6d. each.

Special Prices per lb. and cwt. to Seedsmen and Market Gardeners on Application.

From Mr. JOHN GREENSHIELDS, Gr. to the Earl of Ducie.— "I had a very nice piece of your Early Marble Turnip, and am very much pleased with it; it is very early, of good shape, and the quality excellent.

From Mr. EDMUND COLE, Gr. to Earl Spencer.— "Your New Marble Turnip I found to be a good distinct variety of the Green-top type, with sound handsome bulbs all green above the soil, with white sweet flesh, and is an immense cropper, and will, I should think, become a great favourite with gardeners when better known."

With upwards of Fifty other good ones.

HARRISON & SONS, SEED GROWERS, &c., LEICESTER.

WALKER'S PERPETUAL BEARER PEA.

This valuable New Pea is now being distributed by the undersigned, and can be obtained from all Seedsmen and Florists in the United Kingdom.

Price, per packet, 3s. 6d.

ADDRESS—

CRANSTON'S NURSERY and SEED CO. (LIMITED),

KING'S ACRE, NEAR HEREFORD.

Sales, Thursday and Monday, January 26 and 30.

VALUABLE AND EXTENSIVE
IMPORTATIONS of ORCHIDS
FROM
BURMAH, BRAZILS, AND THE PHILIPPINE ISLANDS.

MR. J. C. STEVENS is instructed by Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, January 26, and MONDAY, January 30, at half-past 12 o'clock precisely each day, the following valuable Importations:—

DENDROBIUM WARDIANUM.

A very extensive lot of this magnificent Dendrobe. Its gigantic, splendidly coloured flowers, together with its free-flowering habit, and its coming into bloom in the dead of winter, makes this one of the very finest of the genus.

**DENDROBIUM CRASSINODE
BARBERIANUM.**

Mr. Rimann writes that the whole of his large consignment are the true Barberianum variety, many plants having quite one-third of the sepals and petals the deepest violet, the flowers being large, round, and of the greatest substance.

DENDROBIUM FALCONERI.

The fine, large, brilliantly-coloured variety with its short, thick nodes, from Upper Burmah.

DENDROBIUM RHODOPTERYGIUM

This may be described as a rose-coloured Parishii. It is extremely rare and very beautiful.

A fine lot of ONCIDIUM MARSHALLIANUM, AERIDES QUINQUEVULNERUM, DENDROBIUM PIERARDI and LATIFOLIUM, DENDROBIUM THYRSIFLORUM, DENDROBIUM PRIMULINUM, SACCOLABIUM VIOLACEUM, and many other species.

On view mornings of Sale, and Catalogues had.

CATTLEYA WALKERIANA (true).

We are pleased to offer the grandest lot ever introduced of this superb Cattleya. Its flowers are 4 to 5 inches across, and remain in perfection longer than any other Cattleya, keeping four to five weeks fresh on the plants, and are extremely sweet-scented: sepals and petals of lovely rose colour; lip large, deep rose, and yellow. This is one of the rarest Cattleyas extant, not having been offered for years.

LÆLIA FLAVA.

Probably the rarest Lælia known, and certainly one of the most beautiful. The plants were seen by the Collector in flower, and are in finest condition. It produces from eight to twelve and more flowers on a spike, and the colour of the flower is pure golden-yellow.

DENDROBIUM FILIFORME.

A fine lot of this rare Dendrobium.

CATTLEYA SPECIES.

A very distinct-looking, and probably quite new Cattleya, from the Brazils.

SUTTONS' CHOICE

NOVELTIES THE BEST of the SEASON.

THE BEST MELON for all purposes.

SUTTONS' HERO OF LOCKINGE.

AWARDED
First Prize at the International Exhibition, Manchester, 1881, in a class of fifty-six entries.
Special Certificate of Merit, Royal Oxfordshire Horticultural Society, 1881.
The First and Second Prizes at the Principal Horticultural Meetings of 1881.
Price, 2s. 6d. and 1s. 6d. per packet, post-free.

From Mr. J. AUGUSTIN, *Gardener to Sir Neville Smythe, Bart., Ashton Court*.—"Your 'Hero of Lockinge' Melon is the most pretty netted Melon I have seen, very thick flesh, of a delicious flavour, and eatable to the rind. Its handsome appearance, combined with its other good qualities, recommend it to all Melon-growers. I consider it a great acquisition."

From Mr. JAMES SMITH, *Gardener to the Right Hon. the Earl of Rosebery, Mentmore*.—"Your 'Hero of Lockinge' is one of the best Melons grown."

From Mr. J. TEGG, *Gardener to John Walter, Esq., M.P.*.—"Hero of Lockinge' Melon is really good in every way; free setter, fine in flavur, and beautiful-looking. I have had the pleasure of judging many Melons this season, and have found none to surpass the 'Hero of Lockinge'."

From Mr. J. CLARKE, *late Gardener to the Right Hon. Lord Hastings*.—"Hero of Lockinge" has turned out a capital Melon with me, the fruits being handsomely netted, medium size, and of good flavur. It sets early and well, even in the absence of sunshine; I had no difficulty with it—that trait will recommend it to growers who wish to get their crops off early."

From J. F. THOMAS, *Esq., Lynchmere, Fayley Hall Estate*.—"Suttons' 'Hero of Lockinge' is the finest Melon I have ever seen: handsomely netted, of exquisite flavur, and was admired by every one who saw it."

From Mr. B. BARIAM, *Gardener to the Right Hon. the Earl of Salford*.—"Hero of Lockinge" is one of the finest Melons ever sent out."

THE BEST NOVELTIES OF 1881.

(Concluded from p. 44.)

GREENHOUSE PLANTS.

THE most important of the subjects we have to mention under this head, regarded from the point of view of its value as a decorative object, is the *Bomarea conferta*, a climbing *Alstromeria*, from *Dogota*, and a very handsome one into the bargain, having purplish pubescent stems, lanceolate long-pointed leaves, and umbellate drooping heads, consisting of several long-stalked flowers, which are elongate funnel-shaped, 2 inches or more in length, and of a bright crimson colour. Another creeper of some interest, this from Assam, is the *Crawfordia luteo-iridis*, which has slender red stems, ovate-cordate leaves, and axillary clusters of bell-shaped flowers, which have a green tube and white limb, and are succeeded by attractive ellipsoid-cylindrical fruit of a brilliant red colour. Still another showy creeper is the *Milletia megasperma*, a tall evergreen woody species, from Queensland, with the habit of *Wistaria sinensis*, having pinnate foliage, and lax drooping racemes of purple flowers, in which the standard is of a rosy-pink. A pretty greenhouse annual, possibly half-hardy, is the *Impatiens Mariane* from Assam, which has thick fleshy stems, and large showy flowers of a charming lilac-purple colour, the lip of which has a longish hooked spur. *Nerine filifolia* is a new form of a pretty group of small *Amaryllid*s, mostly Cape plants; the present species is from the Orange Free State, and has a few subulate leaves, and eight to ten-flowered umbels of elegant rose-red flowers, with oblanceolate crisped segments, and which are produced contemporaneously with the leaves.

Amongst succulents *Aloe Perryi*, the true *Socotrina Aloe*, is perhaps the most interesting introduction, and it has been lately imported direct from the island of Socotra; it has a short erect stem bearing a tuft of from twelve to twenty lanceolat: prickly-edged glaucous leaves, and a forked inflorescence made up of oblong cylindrical racemes of tubular red green-tipped flowers. *Aloe macracantha*, from South Africa, has somewhat the same habit, having the strongly-toothed leaves handsomely marked with whitish spots and lines, and the tubular flowers of an orange-scarlet colour, green at the globose base, and arranged in a dense corymb on simple or forked branches of the flowering stem. Another pretty species, probably of Cape origin, but the history of which is not very clearly ascertained, is the *Aloe Greenii*, which on a short simple stem supports a rosette of lanceolate prickly-edged leaves, which are of a "bright green, with obscure vertical whitish lines, and broad, irregular, transverse bands of confluent oblong whitish spots," while the panicle flowers are tubular, with a constriction above the globular base, and they are of a pale pinkish-red colour throughout. The Mexican *Agave Hookeri*, one of the large American Aloes, has lately flowered for the first time at Kew, and proves to be a noble plant, the lanceolate decurved prickly leaves being 4-5 feet long, and the flowering-stem 30 feet high, supporting near the top the dense lateral

corymbs of large yellow flowers, which have protruding yellow filaments and style.

HALF-HARDY PLANTS.

To this intermediate group, the limit of which is somewhat doubtful, may probably be referred the annual *Impatiens amorphosa* from the mountains of India, a tall, fleshy-stemmed plant in the way of *L. Roylei* (glandulifera), with lanceolate serrated leaves, and loose racemes of pretty pale purplish-red flowers, the long spur of which is tipped with red. These giant Balsams are very effective plants in the summer flower garden. We also refer to this group the Turkestan *Incarvillea Koopmanni*, a slender soft undershrub, whose aspect recalls that of *Amphicocis*; it grows from 2—3 feet high, and has pinnatisect leaves and terminal panicles of pretty pale pink trumpet-shaped flowers. *Kniphofia comosa*, from Abyssinia, may, we think, be also referred to this category; it is a dwarfish species with linear strongly-keeled leaves, and close oblong spikes or racemes of funnel-shaped bright yellow flowers having the long dark red stamens and style much prolonged. The Mexican *Zephyranthes macrostiphon* will probably succeed in sheltered places with moderate protection; it is a pleasing dwarf bulbous plant of the order of *Amaryllidæ*, and produces three or four contemporaneous linear leaves, above which rises the comparatively large long-tubed bright rose-red flower. *Aster gymnocephalus*, also from Mexico, is rather a pretty though loose-growing branching annual (perhaps biennial), growing 1—2 feet high, and furnished with amplexicaul toothed leaves, and solitary flower-heads, in which the ray florets are of a bright rosy-purple colour.

HARDY PLANTS.

Commencing with the shrubby species, we may first mention the Japanese *Clerodendron trichotomum*, an ornamental shrub, growing from 6—10 feet high, with ample opposite ovate leaves, the lower of which are three-lobed, and lax trichotomous cymes of white flowers of which the calyces are of a brownish-red colour. From Northern China and Amur-land comes *Clematis ruthenifolia latisecta*, a graceful climber, with compound pinnate leaves, and very abundant creamy-white decurved flowers, which in form are between cylindric and bell-shaped. The Chilean *Escallonia rubra punctata* is a nice addition to its genus, having elliptic leaves broader than those of the type, and rather conspicuous deep red flowers. The *Prunus Pissardi*, introduced from Persia to the French gardens, will probably become useful as an ornamental hardy shrub, since it has the oval glabrous leaves of a deep purplish-red colour. The new Ivy, *Hedera Helix maderensis variegata* (*Gard. Chron.* xv. 657, fig. 118), is a valuable hardy climber on account of its bright clear variegation, the white margin being broad and well defined. In *Acer distylum* (*Gard. Chron.* xv. 499, fig. 93) and *Acer carpinifolium* (*Gard. Chron.* xv. 504, fig. 105), we have two ornamental additions to the list of Maples; both are Japanese, the first with cordate acuminate leaves, the latter with the leaves obovate-oblong acuminate. Finally, in *Vitis striata* we have a very desirable evergreen climber, not quite new but very little known, which has handsome-looking dark olive-green digitate leaves, having the leaflets oblong, and which bears cymose greenish flowers succeeded by red berries.

Of Hardy Perennials *Shortia galacifolia* (*Gard. Chron.* xv. 509, fig. 109) is one of the most distinct and interesting; it comes from North Carolina and Japan, and is of dwarf habit, with cordate remotely-toothed leaves, and conspicuous bell-shaped white flowers; the plant belongs to the small unfamiliar order *Dipsacaceæ*. The Japanese *Lysimachia bra-*

clystachys is much like a white-flowered spicate *Veronica*; the leaves are lanceolate entire, and the flowers are small, white, in dense terminal spikes 5 or 6 inches long, while the whole plant is of a decidedly ornamental character. The Liliaceous genus, *Eremurus*, furnishes two ornamental species, namely, the Turkestan *Eremurus Oligeri*, a stately plant of erect habit, with a tuft of narrow linear-lanceolate leaves, and a long dense raceme of white star-shaped flowers, upwards of an inch in diameter and of a brownish-red colour on the outside; and the Indian *Eremurus himalaicus* (*Gard. Chron.* xvi. 49), an elegant, dwarfier species, with strap-shaped acute leaves, and scapes 1—3 feet long, bearing a dense raceme of pretty white, starry flowers. In the Californian *Aquilegia formosa* we have gained a very handsome Columbine in the way of canadensis, with binate leaves, and large long-spurred yellow flowers of very attractive character, the spurs and the edges of the sepals being bright red. Iris missouriensis, from the Rocky Mountains, is a pretty species of the Flag genus, the habit slender, the leaves narrow, and the flowers pale lilac-blue, with the whitish falls veined with lilac. Japan yields us a new Primrose in *Primula pocaliformis*, a pleasing species of the cortusoides type, with blunt oblong-cordate leaves, and umbels of pale lilac flowers, not so fine as *P. Sieboldii*, but probably capable of improvement. From Istria we get the Campanula Tommasiniana, a very elegant species, with slender erect stems, 8—10 inches high, clothed with lanceolate acuminate leaves, and pretty cylindrical lilac-blue nodding flowers, very freely produced from the upper leaf-axils, and thus forming a second leafy raceme; it has been grown for some years at Kew, but does not appear to have come into general cultivation. Two species of *Statice* have been added from Turkestan: one, called *Statice callicoma*, is of dwarf habit, and has spatulate scaly leaves, and a densely branched cyme of rosy-lilac flowers; another, called *Statice leptoloba*, produces a tuft of radical oblanolate-spatulate leaves, and slender forked flower-stems bearing short spikes of flowers which have a purple funnel-shaped calyx and a yellowish corolla. Turkestan also yields a showy new species of *Larkspur*, *Delphinium corymbosum*, which grows only 1½ foot high, with a corymbosely-branched stem, palmatifid five-lobed leaves, and pale violet flowers in racemes. Eastern North America furnishes a hardy aquatic in the *Nymphaea tuberosa*, a faintly-scented white-flowered species in the way of odorata, with tuberous rootstocks, the tubers resembling those of a Jerusalem Artichoke, and both leaves and flowers rising above the surface of the water. Finally, we have a good Composite in the Japanese *Senecio stenoccephala* var. *conosa*, (*Gard. Chron.* 1881, p. 304, vol. xvi.), a really pretty plant, with ovate acute cordate or hastate leaves, and densely-packed oblong spikes of yellow flower-heads: very distinct in character.

Of the Hardy Bulbs we may particularise a few of the most remarkable. Firstly, *Colchicum crociflorum*, a Turkestan plant, with white flowers striped with purple outside, and at first sight very much resembling those of the Scotch Crocus. From the same country come *Scilla puschkinoides*, a pretty white-flowered species, with broadly linear or obversely lanceolate leaves, and a scape a few inches high, supporting several gay flowers fully an inch broad, of a greyish-white colour, with a blue stripe on each segment; *Allium stipitatum*, a rather stately plant with narrow linear-lanceolate leaves and a great hemispherical umbel of narrow-petalled flowers of a pale rosy-lilac colour; and *Leontice Alberti*, a dwarf plant, with imparted digitate leaves, having five-parted leaflets, and racemes of pretty reddish-orange flowers. *Helicophyllum Lehmanni*, also from Turkestan, is a tuberous-rooted Arad, with the radical leaves narrow lanceolate and petiolate, and the oblong-elliptic spathe 6 inches long, green outside and dark purple within, surrounding a black spadix, which projects some 4 inches beyond the spathe.

This selection of the more interesting plants of the year leaves many welcome additions to our lists of garden plants unmentioned. *T. Moore.*

New Garden Plants.

DOMAËEA SHUTTLEWORTHII, *Mast.*, sp. n.*

(Fig. 14, p. 85.)

This is a new and handsome species, recently introduced from the neighbourhood of Bogota by Mr. Carder, and cultivated by Messrs. Shuttleworth, Carder & Co. The species belongs to that section of the genus marked by a branching inflorescence and equal perianth-segments. To this section, according to Mr. Baker, who kindly placed his notes at our disposal, belong only three hitherto described species, *B. Carderi* (*Mast.*, in *Gard. Chron.* 1876, vol. vi. p. 793, fig.), *B. Jaquesiana*, and *B. formosissima*. From these our present plant differs in the size, shape, or colour of the perianth-segments. The material placed at our disposal by Mr. Shuttleworth consists of rhizomes, roots, tubers, fragments of leaves, inflorescence, fruits and seeds, together with a watercolour drawing of the inflorescence and flowers, executed in Colombia by Mr. Carder. The rhizome is horizontal, of the thickness of the finger; in its under-surface spring very numerous unbranched root fibres of the thickness of whipcord, terminating in oblong-ovoid tubers, having much the colour and aspect of Potatos, but destitute of buds or eyes; umbilicate at the proximal, somewhat acute at the distal or free end. The leaves are about 5—6 by 2 inches, glabrous, ovate-lanceolate, parallel-nerved, the secondary transverse nerves nearly horizontal and at some distance apart, so as to form oblong or nearly square interspaces. Inflorescence of umbellate pendulous cymes, the primary peduncles 5—9 having small bracts at the base of each, unbranched for about 3 inches, then once or twice dichotomously branched, the ultimate pedicels spreading, and as long or longer than the flowers. The perianth measures 2 inches and upwards in length, is funnel-shaped or elongate bell-shaped; of the six oblong-acute nearly equal segments the outer are orange-verticillate (according to the drawing), slightly tinged with green and dotted with small dark spots at the tips; the inner are rather more acutely pointed, canary-yellow, with a red midrib, and green with dark spots at the tips; the fruit is a leathery three-sided club-shaped capsule, scarcely 2 inches long flat at the top, opening from below upwards. The seeds are globose, of the size of a very small Pea, blackish, and pitted on the surface.

The brilliant red and yellow flowers and the equal perianth segments are alone sufficient to distinguish this species from its near allies, and they are likely to commend themselves highly to the cultivator.

The large fleshy tubers are not available for purposes of propagation, inasmuch as they are genuine root-tubers, and as such are destitute of buds, but as stores of nutriment they must be very efficacious, and their presence would seem to indicate a prolonged arrest of growth in the dry season. Probably these tubers would be available for human food, as those of *B. edulis* and *B. balsilla* are said to be. Mr. Shuttleworth tells us that in Colombia pigs take great pains to uproot them, and devour them with great relish.

We have dedicated this species to Mr. Shuttleworth, to whom we owe the discovery and introduction of the beautiful *B. Carderi*, and to which the present species, detected by his associate, Mr. Carder, is no unworthy companion. *M. T. M.*

LELIA CALLISTOGLOSSA, *nov. hybr.*

A new Sedianian hybrid, a seedling between *Lelia purpurata* and *Cattleya Warscewiczii* (gigas). Mr. Harry Veitch kindly informs me that the bulb has the shape of that of *Lelia purpurata*. The young plant has that organ 4 inches high, the leaves attain 12 inches by 2½. Subsequent flowers will no doubt manifest great improvement, as Mr. Veitch conjectures, both from the nature of the glorious parents and the fact

* *Domaëea Shuttleworthii*, *Mast.*, sp. n.—Rhizomate crasso repente hinc radicales simp. ces. tubere oviformi magno terminatus proferente; foliis glabris late ovatis utroque acutis; cymis pendulis umbellatis ramosis, pedunculis pedicellis que longiusculis divaricatis; floribus 2½ poll. infundibuliformibus; perianthi segmentis (ex tunc et Carderi) subobovatis conformibus oblongis acutiusculis exterius aurantiacis rubris, internis hinc apice viridibus illoque punctatis, nervo medio rubrate; capsulis 1½ poll. longis triquetris clavatis apice truncatis; semibus magnitudine post parvum subglobois nigrescentibus compresso-punctatis. In Colombia prope Oceanum, detecta Carder. *M. T. M.*

FIG. 11.—TUBERS OF DOMAREA SHUTTLEWORTHII: NAT. SIZE. (SEE P. 76,

that the flower did not enjoy the usual benefits of a covering spathe. I would, however, vindicate the flower against its possessor. Even as it is now, it is a fine thing. The petals are broad oblong acute, the sepals narrower, all pure rose. The lip, my great favourite, has a broad middle lacinia, which is nearly reftuse, and obscure obtusangled small side lobes. All the anterior part is of the warm dark purple of a fine *Laelia purpurata*, the upper edge of the lip yellowish, the disk whitish, with numerous purple lines. The column is very slender, as in the *labiata* group, whitish, with purple point. There are but four pollinia, but since the caudicles are not free on one side, but attached on both sides, and since we can see the limits of the connate pollinia, we prefer to regard it as a *Laelia*. The plant is undoubtedly very promising, and the idea of crossing the two parents was decidedly a fortunate one. *H. G. Rehb. f.*

CYPRIPEDIUM MICROCHILUM, nov. hybr.

A new Sedenian product, a hybrid between *Cypridium niveum* and *C. Druryi*, just sent by Mr. Harry Veitch, who kindly informs me that it is not so sessile as *C. niveum*. It is a very free grower, branching freely. The leaf is larger and narrower than that of *C. niveum*; fine green, with more obscure marbling (the longest one 0.12 : 0.025 m). The stem is said to be about 3 inches high now. The peduncle is 0.13 m. high, dark brown, villous, with a small bract, shorter than the pedicel. The flower is broader than that of *C. niveum*, the odd sepal more acute, the petals not so broad, and more directed downwards. The upper sepal has seven dark cinnamon stripes outside, the middle one only very well conspicuous inside. The petals have a dark purple-brown middle line, and lines of small spots as in the odd sepal. The sepal formed by the two connate segments surpasses the length of the lip. The lip itself has the central anterior part protruded in a retrorse lobe, as in *Cypridium Druryi*. It has rounded obsolete side lobes, and the whole body is not rounded, but runs out in a conical anterior base. There are some purple-brown figures and stripes. It is unusually small; we must, however, wait to see whether it will always remain so very small. Poor *Cypridia* suffer from an exceptional propensity to anomalies, and one of these is the starved state of the lip. The cordiform acute hairy white staminode is not unlike those organs of the parents, even intermediate between them. This is very curious. There is a central yellowish blotch, but without those radiating lines which are so remarkable in *Cypridium niveum*, where they are often comparable to the outline of a chlorophyll mass of a *Zygnema*. *H. G. Rehb. f.*

COLCHICUM MONTANUM.

We learn that the plant shown by Mr. Harpur Crewe at the last meeting of the Scientific Committee (see p. 58), from Smyrna (whence it was introduced with bulbs of *Chionodoxa*), has been determined to be the *Colchicum montanum* of Linnaeus, which has previously been a puzzle to botanists.

PRIMULAS AT CHISWICK.

ALTHOUGH raisers of good varieties or strains of the Chinese Primrose in years past have done good work and brought the flower to high perfection, as far as size and quality, bloom and general habit of growth are concerned, yet with Chiswick must ever be associated the reputation of having given to us that superb rich red strain that under the earlier designation of Chiswick Red has now found duplicates in Swanley Red, Meteor, and other appellations. Prior to that introduction we had not been without some rich hues, both carmine and red; but whilst the carmines were fleeting, too often fading in heat or damp, and leaving behind a spoilt flower, the reds were of the purple type and containing more magenta than scarlet. We have seen in years past and in provincial districts grand blooms fully 2 inches across and finely fimbriated, quite as fine as the best blooms of to-day, having deep purplish-red hues; but these were not well fixed. There has always been a tendency in deep colours to run back, and none has at any time such constancy and permanence as the deep-coloured form now so well known as the Chiswick Red.

Few breaks or new kinds have shown so rapid a tendency to improve as this has. When first sent to

Chiswick from Paris the flowers produced were small, and though of striking colour yet of indifferent quality. That was but four years since, and now the flowers are not only of the finest but the colours deepening every year. The simple process of careful fertilisation of the darkest coloured blooms, and saving seed from these only, leads to the inevitable result. We may in a few years find the Chinese Primrose vining with the zonal Pelargonium in the richness of its floral hues, rendering it more and more valuable as a winter-blooming plant. Some large plants in 24-sized pots in one of the houses should show this brilliant red kind in its best character. We have seen plenty of it as yearling plants usually, but it has yet to be seen as show plants with heads of bloom 1 foot over. A very pretty and distinctive kind at Chiswick is one that has leaves and stalks showing colouring of an intermediate kind, and which produces flowers that open a delicate flesh tint and deepen to carmine. Curious as it is to see flowers of these distinctive hues on the same truss the kind is not the less noticeable for the purity of its lemon eye, which is surrounded by a distinct white ring. The quality of flower and habit of plant are both excellent. From out of this kind, the product of a cross with Chiswick Red, has come a true rich carmine that for all ordinary purposes is very distinctive.

The purples generally are of that fine strain so popular in the market, the flowers large and of good quality. On some of these are being used pollen from the rich-coloured *Rubro-violacea*, with the object of enriching the purples, and yet retaining size and quality. So far great depth of colour of the purple hue has not been found associated with size, and small blooms, however rich in colour, are not now looked upon with favour. Curious and, indeed, beautiful as is the foliage and habit of Williams' Alba Magnifica, yet the flowers fail to make the impression produced by the pure white strain growing at Chiswick. So-called whites, as a rule, always become tinted with pink. This falling is very marked in Alba Magnifica, but the white here is as pure as snow, and the flowers are of first-rate quality. One feature about the eyes of these kinds is noticeable—whilst those of Alba Magnifica are of a confused lemon those of the pure white are orange. The habit and leafage of Mr. Williams' kind is, however, so pleasing and novel that it is hoped raisers will endeavour to engraft upon it various other colours. Having reached to such a point in the flowers there is no reason why the foliage might not have attention.

But the greatest novelty in this direction is seen in M. Lemoine's *Fimbriata cristata nana alba* [such a name should not be tolerated. Ed.], the flowers of which, small, of indifferent quality, are pure white and show evidence of doubleness. The leaves of this kind are singularly crested, each segment round the margin of the leaf being curiously curled, and the feature is even and perfect throughout the plant. This kind should make a capital breeder, but the blooms will have to be split to enable fertilisation to be effected. Some plants of Vilmoren's *Punctata*—which produce curious white specks on the flowers of a reddish-carmine hue and which have broad irregular white margins—now in bloom, do not promise to become a popular variety. It would take a lot of crossing to bring it into form, and the eye needs to be very much diminished. The only kinds in the Fern-leaf section are forms of the lilac-coloured variety that have usually white margins to the petals. That these have been bred from the much older white kind there can be no doubt, as the foliage is of that pale green tint peculiar to the white and this kind. These differ materially, for while one form is of a reddish-pink hue the other is blue-red. Of a similar coloured variety on the ordinary foliage very many of the blooms are distinctly flecked with a darker hue.

Primulas are so well done at Chiswick that we may be excused for wishing to see there just for once a wide representative collection of the single varieties. There is a fine lot of doubles in bloom, but as these can only be propagated by cuttings they produce no new varieties, and therefore lack the interest incidental to hybridised flowers.

A fine lot of *Cinerarias* fast coming into bloom, and which fill a large spanhouse, show splendid culture, the habit dwarf, and the leafage clean and remarkable for size. If the flowers prove as fine as the plants deserve the strain will be a singularly good one.

FARNINGHAM ROSE SOCIETY.—The committee of the Farningham Rose and Horticultural Society have altered the date of their next exhibition to June 29 instead of July 1, as announced, owing to the Crystal Palace Company having decided to hold their Rose show on the latter day.

GRAPE GROWING AT WHETSTONE.

THE acres of glass-houses at Mr. Davis' here have for some years been undergoing a change in the character of the crops grown therein. Where, at one time, plants for market were the principal feature, Grapes have now gradually taken the lead, for, although immense numbers of plants are still grown, yet they in a great measure consist of such things as can be accommodated with the Vines. Since foreign Grapes have reached this country in such quantities, not a few of the English growers have confined their practice to late keeping kinds, which are less interfered with by foreign competition than the earlier produce. Yet Mr. Davis has by no means seen cause to deter him from growing large quantities of early and mid-season Grapes, as well as late ones; the last of which are only finished as the new crop comes in. Five houses, each averaging near upon 100 feet long by 20 feet wide, are forced, so as to have their crops ripe from April 1 to the end of June. I may remark that the root treatment of the Vines is here about as widely different as it well could be imagined. The older Vines, some of which have been in being between twenty and thirty years, are mostly in borders of ordinary size—that is, with a considerable space wherein the roots can extend, whilst those that have been planted more recently have borders unusually limited in extent, not more than 6 feet wide by 4 deep, beyond which the roots cannot get.

Two new span-roofed houses, standing side by side, each 140 feet long, are filled with *Gros Colmar*; the eyes were struck in February, 1880, and planted the middle of June, forty-five in each house. These have borne a crop averaging 12 lb. to each Vine, all cut and sold within twenty months after the eyes were put in, and pronounced by those able to judge equal to any that have ever appeared in the market. Not much waiting here for the Vines getting age, such as is usually considered necessary. I had almost said age and strength, but if they have not the former, the latter is unmistakably present; for notwithstanding the weight of fruit they have borne the canes at a considerable distance above where cut back at pruning time—are of unusual thickness—some 1 measured under the ridge of the house were over 2½ inches in circumference, and it would be difficult to find anything more even than they are through the two houses. The borders are 6 feet wide by 4 feet deep. Another house, 120 feet by 24 feet, all *Gros Colmar*, just finishing a good crop of fine bunches with big berries. Some of these Vines are confined to a single cane, but the greater portion have two; in both cases they are 3 feet apart.

What these Vines have done may be judged from the fact that for eight consecutive years those with single canes have borne 30 lb. each, and those composed of two canes 60 lb. Last year's crop was similar in every way to those that preceded it—the bunches averaging 2 lb. each. A house, 90 feet by 24 feet, all *Black Alicante*, except a few *Lady Downe's*, carried a beautiful even crop, as black as possible, with full-sized berries. One side of a 110 by 15 feet span is also filled with *Black Alicante* in bearing nine years; the weight of perfectly finished fruit in this house was such as needs being seen to be credited, and yet the whole extent of border is only 3 feet 6 inches wide by 4 deep. The opposite side of the house was occupied with *Black Hamburgs* last year, cleared out to make room for *Black Alicante*, as the fire required for the latter, already existent, was so much wasted on the *Hamburgs*. The noted house of *Lady Downe's*, 100 feet by 24, now in bearing fifteen years, has during that time been seen by many Grape growers from different parts of the kingdom, and is justly looked upon as having few equals in the weight and quality of the fruit it regularly bears. Nothing in the way of this excellent keeping Grape could be finer or more uniform in condition from end to end; it contains 375 bunches that will average 1½ lb. each. None of them will be cut before the end of February, the whole not finished until the beginning of April, when the first of the new ones come in.

Large as the quantity of Grapes grown here now is, it promises to be much larger. Two new span-roofed houses, each 186 feet by 23, have been built, and were planted in July with *Lady Downe's* raised from eyes in February, which have made beautiful growth, reaching to the top of the houses.

These two spans contain 900 feet of 4-inch piping. Vets another new house, half-span, 120 feet by 25, planted in July with *Altwick Seedling*, the eyes direct from Mr. Bell, and like the *Lady Downe's* struck last February; they have done as well as the others already noticed. The even growth of the whole is most remarkable—scarcely a single rod lagging behind its neighbours.

It has been the fashion to condemn the use of stimulating manures in the formation of Vine borders, but Mr. Davis does not follow such teaching, as he uses plenty of dung for the roots to feed on from the first.

Camellias are largely grown, four big houses being filled with them, one of which is a series of spans 80 feet long by 60 feet wide. Most of the trees are planted out, and have attained a large size, and are in the most perfect health, as evidenced by their free growth and beautiful dense foliage, which is kept perfectly clean, so that the leaves shine like Laurels. It is doubtful if the equal of one of the trees here exists elsewhere; it measures 60 feet round the extremities of the lower branches, and about 16 feet in height, as thickly clothed with foliage as a *Portugal Laurel*. Some five years since account was kept of the number of flowers gathered from it in a single season, which reached 7000. Mr. Davis' system of *Camellia* growing is not to let the plants carry more flowers than they can support, and grow to full size; for to this reason the buds are thinned so as to leave two to each shoot.

Red Currants have for many years been extensively grown here, and occupy a considerable extent of ground. Through the season that the fruit is ripe a ton is sent to market every other day. T. B.

THE CULTURE OF EPACRIS.

THE cultivation of the *Epacris* for the supply of cut flowers, and also for the decoration of the conservatory, is not appreciated as it deserves to be. Healthy and vigorous plants will yield an abundant harvest of cut bloom, lasting well for at least a week after they are severed from the plant. There is no lack in variety of colour, nor is there in the size of the individual spikes; every plant will give variety in size to suit every requirement. Flowering throughout the winter months in any cool house, they are of great value to many who may be placed in disadvantageous circumstances with respect to early forcing of varied shrubs and bulbs. We grow them here in quantity, and find them extremely useful and much appreciated.

When housed in the autumn, generally during September, they are placed in ainery at rest, and where the wood is partially thinned out. As each house in succession is started they are removed to others at rest, until the latest inery is started in March. About this time they will show signs of starting into fresh growth; when indications of this are seen they should at once be cut back tolerably close if the plants are past their best in regard to flower. When breaking freely any that require a shift should be seen to before a too vigorous growth is attained. For this operation select good sound fibrous peat, from which any crude, inert matter should be removed: this with a good mixture of silver-sand and a few pieces of charcoal if the plants are large, will give a suitable soil for them. Be careful not to pot any that can be depended on to do well another season without being disturbed.

The temperature of the late inery seems congenial to the development of a good growth, without which a good supply of bloom need not be expected. We remove ours to cooler quarters when the shade from the Vines becomes too much for their well being, gradually hardening them off till about the first week in June, when they are stood out-of-doors on a bed of coal ashes. During the latter part of the summer they should be exposed to the full sunshine to harden their growth. By the treatment here detailed, I find them to come earlier into flower than if always kept under greenhouse treatment.

The following is a good selection of varieties:—Of whites, *Hyacinthiflora candidissima*, *Alba odorata*, *Vesta* and *onosemiflora* are good kinds; *Hyacinthiflora*, *Kinghorni*, *Delicata*, *Albertus*, *Devoniana*, *Lady Alice Peel*, *Mrs. Pym* and *Vesuvius* are all good sorts, varying in colour from pale pink to crimson. *Miniata splendens* and *Eclipse* are first-rate kinds, but quite distinct in growth from the aforementioned;

these should be grown under ordinary greenhouse treatment, thinning out weakly growths and tying the stronger ones to keep the plants somewhat shapely. At all times give close attention to the watering of these plants. They soon show signs of distress if overlooked, on the other hand they must not be overdone. When in full flower a rather more liberal supply should be given. Rain-water is always preferable where there is a good supply. *James Hudson, Gunnersbury House, Acton.*

TOMATOS PLANTED OUT.

THE public are beginning to appreciate the virtues of the Tomato, and the demand for them seems likely to be greater than the supply. The best way to meet this demand—which is as great in winter as in summer—is in having well appointed houses in which they can be planted out and trained on some systematic principle. The house we use here for giving a supply of Tomatos through the late summer and winter months is a span-roof with a 12-foot rafter, which gives the plants ample room to develop. The beds we plant in are 2 feet wide and 1 foot 6 inches deep, and are formed by building up the sides with turf, commencing on the floor of the house, which is formed of rough gravel, and this acts as drainage for the beds.

The soil for the Tomato when planted out should be open and porous rather than rich. A good fibrous loam, with one part of lime rubbish and a sprinkling of bone-meal, will be found to answer well, and retain its porosity for a considerable time, not readily becoming soured with frequent doses of liquid manure which will be required when the plants get over their first flush of vigour, and commence to fruit the whole length of the rafters. The greatest mistake generally made in growing the Tomato is in the training of the plants, which are allowed to run in all directions till they become a confused mass, and this is often aggravated by stopping the plants above every show of fruit. The method we adopt is to train the plants as single, double or triple cordons. For the first method of training we plant about 10 inches apart, and for the other methods we give room according, that is, about 10 inches for each growth. These cordons are allowed to run from the bottom to the top of the house without being stopped, and we never find them fail to show fruit about every six inches; and if the temperature and atmospheric conditions of the house are kept right every flower will set perfectly, and the result is a perfect wreath of fruit from bottom to top, and from end to end of the house.

As fast as the first fruits ripen and are gathered from the lower part of the cordon, another leader is brought away from the base, and is allowed to proceed as fast as the fruit is gathered on the first cordon. The second shoot soon commences to show fruit, and with a little thinning of foliage and the removal of the greater part of the foliage from the lower part of the original shoot, the young fruit has room to develop, and the result is that the house is kept continually furnished with fruit, without the growths getting in any way entangled or confused. A little care must be exercised in watering when there are many fruits ripening on the plants, as they are very liable to crack with a sudden dose of water, especially if the plants have been allowed to get very dry, but the most prolific cause of cracking is closing the house, and watering and syringing the plants at the same time.

The temperature we find to answer through the spring and winter months is 55° to 60° by night, and about 63° by day; during the summer the temperature can be regulated according to the weather, as fire-heat will not be needed unless the weather should be very dull and damp, when it will be necessary to use it a little to keep the atmosphere buoyant, and as an aid to free ventilation, as it is at all times necessary to have a circulation of fresh air through the house, and this should not be overlooked with moisture. A damp, stagnant atmosphere is fatal to obtaining a full set of fruit.

The varieties of Tomatos to select from are now plentiful enough; our favourites are Hathaway's Excelsior and Trophy. The former is a handsome variety of medium growth, and a sure fruiter; the latter is one of the largest varieties, very prolific, and perhaps unsurpassed in quality. Seed of some approved variety should be sown at once in brisk

heat, shifting them on as they fill their pots with roots, and confining them to single stems till they reach the height of the trellis to which they are to be trained, when they should be allowed to grow as single or double cordons. *J. Roberts, Gunnersbury.*

FLOWERS OR SHOOTS.

In the *Gardeners' Chronicle* of January 7 there is a very interesting and suggestive extract from Count du Buysson, which I would like to notice. Gardeners very well know that whether plants will flower profusely, sparingly, or not at all, depends to a great extent on the state of maturation to which they have been brought previously. This is true alike of Apple trees, Rhododendrons, or Orchids, and almost all flowering plants cultivated in gardens, as well in the open air as under glass. The idea that after flower-buds are formed they may be changed into leaf-shoots is, to me, a new one, and so extraordinary that I venture to think some misinterpretation of the facts has occurred [and so do we]. We are all perfectly aware that when shoots, bulbs—what you will—of Dendrobies are imperfectly ripened they in many instances, notoriously so in the case of *D. nobile*, produce leaf-stems where flowers generally appear. This results, as has generally been understood—and as I, for one, still believe—not because of any particular treatment the plants receive after the buds begin to grow, but because of the want of due exposure to the light the previous autumn.

Many, very many, plants have the power of modifying their manner of propagation according to the circumstances under which they are placed. Common Leeks, for instance, in cold climates produce many miniature bulbs on the top of the flower-spikes instead of the seed which they form under more favourable circumstances; not because of an extra supply of nutriment, but because of the want of enough light and heat. Other instances your readers will readily recall. The idea presented to me in the extract referred to is that a certain measure of starvation will make matters right. So far as regards plants growing under climatal conditions which we cannot modify, such is the only course left us, and has been pursued by us for many years; for it is with this end in view that we have used grit in our fruit tree borders, and have employed loam without much manure, and have rammed it hard to prevent a too rapid taking up of even what limited supplies of food were available. And when I did feed it was by surface-dressing, which would encourage the roots to seek the sun-warmed food, so that no lowering of the temperature of the trees might occur through cold sap. All this I have done, and so far it agrees with what is hinted, excepting that we never dreamed that a wet spring would change our blossom-buds into "leaf-shoots," although it might spoil the flowers that did form.

It is, however, more particularly to house plants, and especially Orchids, that the Count refers. As we differ altogether from the opinion that extra supplies in spring do the mischief, we think that, generally speaking, any degree of starving should be avoided, because we have the climate of hothouses in our own hands to a great extent. I by no means mean by this that Dendrobiums at all stages of their growth should be liberally supplied with water, either in the soil or the air, for such would certainly defeat our purpose if flowers were our aim. At the same time I think that it is not good to starve in any degree. The right thing in the case of Dendrobium *nobile*, and many other plants—Vines, for instance—is to start early in the season, so that the growth may be made up early, and fully matured under the influence of the sun ere yet the sun's beams have lost their power to mature. No plant requires the same moisture at the root while ripening that it does while pushing out shoots and leaves rapidly, and in many instances disaster will result if growing conditions are maintained for ripening plants.

In the case of Dendrobium *nobile*, and many others, we find that when the growths are fully made up by August, in a house not too moist or shaded, and afterwards exposed to the full sun and abundance of dry warm air, that a very free state of flowering results. When the growth is made up late, and in moist shady quarters, the result of this drying and exposure later on is shrivelling, debility, a scarcity of flowers, and a predisposition to produce "leaf-shoots" in spring, no matter what conditions they are

then subjected to. This year our Dendrobiums are flowering less profusely than they did last year, and yet they had both years the same treatment. The seasons, however, were in this district very different: 1880 was fairly sunny, while the autumn was particularly bright; 1881 was cold and dull, especially in autumn. The consequence of this was that all our indoor plants, even although helped by extra fire-heat, were later in making up their growths, and finished them under unfavourable circumstances. In the case of our Vines we fired on later to make up for deficiencies; but our Dendrobies (for want of sun in autumn, not because of too liberal supplies now), are producing flowers less freely than usual, and many more "leaf-shoots." Those later on, as with the Count's, produced more freely at the tops of the bulbs, while the former are, like his, produced lower down. This, we consider, is owing to the tops being less fully ripened, and not to any special determination of sap to the tops. Such a flow of sap may help to produce larger, finer flowers, but I cannot think it would change flowers into shoots.

In the case of many other Orchids which grow freely but flower sparsely, or not at all, all they want is more air, more light, and more heat, rather than a withholding of supplies. *Olonoglossum cirrosium*, which in a cool, moist, shaded house grows so very freely, and throws up long spikes which never flower, or only produce one or two blossoms to the yard of spike, change for the better when grown in a light, airy position in an intermediate-house, but they will grow less freely. As a matter of fact, Nature strives to reproduce the species by seed, and when the atmospheric conditions for that are unsuitable, she falls back on the vegetative method as a last resource. Taking advantage of this fact we can produce the majority of plants at will by whatever mode promises the best results. Taking advantage of this we improve the artificial climates in our vineries by firing—not by starving—so as to prepare the Vines to propagate themselves by seed to as great an extent as possible. Taking advantage of the knowledge painfully and slowly acquired, we limit the food supplies to our outdoor trees, where that is necessary, and secure the same result; when the trees are young and scarce we follow the opposite course to secure, not seeds, but "leafy shoots" to graft with.

It is the same with all our fruiting and flowering plants, Orchids not excepted. It is this knowledge which causes us to adopt so very different practices where different results are wanted; and this which makes us adopt quite different modes, according to the subjects we cultivate and the latitude in which we practise. It is this which shows one course to be right under bright skies and in dry localities, and wrong when clouds lower and rains reign, and *vice versa*. *Practical.*

A FAMOUS PLANT-POTTER.

ON the evening of November 15, James Markey, who has gained a national reputation as an expert greenhouse workman, dropped dead of heart disease, near his residence on Jersey City Heights. Though only thirty-four years of age, he had been employed in the greenhouses of Peter Henderson for nearly twenty-three years, having begun at the early age of eleven years. In all operations in the greenhouse Mr. Henderson has always claimed he had no peer for rapidity and neatness. In the operation of potting he daily did the work of two average men, and was paid accordingly.

It will be remembered that some years ago, when Mr. Henderson asserted in the columns of the *Gardener's Monthly* that James Markey potted 7500 plants in ten hours, several of our readers questioned the fact. Long since then Mr. Markey had far surpassed even that extraordinary record, and had repeatedly potted 10,000 in one day of ten hours; and on one special occasion—in April, 1881—he potted 11,500 rooted cuttings of *Verbenas* in 2½-inch pots—a feat probably never equalled, or even approached. Besides being an extraordinary workman, few men of his years were possessed of such varied and comprehensive knowledge of greenhouse work. Mr. Markey was a native of county Meath, Ireland, but came to this country at an early age, and, except two years which he served in the war of the Rebellion, had been from first to last in the employment of Mr. Henderson. He was modest and unassuming to a fault; a generous-hearted open-handed fellow, and enjoyed the respect of his employer and fellow-workmen to an extent that few men ever attain. *American Gardener's Monthly.*

PINUS CEMBRA.

Of all the trees which cover the mountains of Switzerland, the Arolle (*Pinus Cembra*) is that which offers the greatest interest and the most distinct appearance. Originating in the great forests of Central and Northern Asia this tree migrated into our western countries during the glacial period, when enormous glaciers and wastes of snow covered the centre and north of Europe. Later on the heat increased, and the arctic vegetation took refuge on the high ground, where it met with the necessary conditions for its existence. *Pinus Cembra* did the same, and invaded all the valleys of our higher Alps. It is the only resinous tree met with at that altitude, but at the present time it is unfortunately decreasing and becoming more and more rare. It is the only species of tree capable of living at so great an elevation, and the herdsmen have no other firewood. The destruction of these trees proceeds then in proportion as civilization advances. Already they have disappeared from several of our cantons, while in others the Government has been obliged to take steps to prevent their total destruction.

Setting aside the advantage that it presents, in its growth at heights where no other tree flourishes, it possesses properties which render it very valuable. Its hard balsamic wood is excellent for firewood and for constructive purposes. It is full of resin, and its seeds furnish nourishment to a number of animals which frequent our high Alps. Besides, it has the advantage of growing in places the least favourable to vegetation in general, as on loose rocky soil, and on the moraines, where it serves to check the progress of avalanches and inundations.

It attains a great age, and specimens have been found in the Alps at a great elevation, supposed to be more than 1000 years old. It grows to a height of from 20 to 25 metres (60—70 feet), which is enormous in comparison with the dwarf and liliputian herbs which grow at these elevations. It is a noble-looking tree, with spreading branches disposed horizontally, but turned up at the tips so as to resemble an immense candelabrum. The illustration fig. 13 shows one of these Pines which grows near Gruben in the Upper Valais, near the Turtmann glacier. During the heat of summer the tree exhales a very agreeable resinous odour. Its distinctive character resides in the fact that the leaves are arranged in fives in each sheath. They are of a glaucous green colour, and very long. The cones are obtuse and irregular, and take several years to arrive at maturity. They contain seeds like those of *Pinus Pine*, which are eaten and much sought after by animals, which is one reason of its scarcity. At Geneva there are several specimens which are greatly admired. The tree, which has been called with much reason the Cedar of the Alps, succeeds well in stiff and stony soil, nevertheless our dry climate, and our cold, dry north winds, do not suit it. The English climate suits it much better. There is a very fine Arolle in the garden of the Campagne Neville near Geneva, which dates from the time of Horace Benedict de Saussure. This tree is 10 metres in height, but has not yet produced seed. There is at Pregny, in the fine garden belonging to Baroness Rothschild, an Arolle younger than the preceding, but growing under better conditions. It is planted in a cool place, and sheltered from the hot rays of the mid-day sun. Several members of the Alpine Club have transported to their gardens specimens which are flourishing more or less. M. Darier, at La Servette, near Geneva, has a particularly fine specimen. M. Davall, of Vevey, who specially interests himself in the cultivation of *Pinus Cembra*, raises them successfully.

Transplantation of this species from the mountain side to the plains is not a good plan, although it is the one adopted by ninety-nine out of a hundred persons desirous of growing the plant in their gardens. Thus this tree has the unmerited reputation of being very difficult to grow. The best time for transplantation is in May or June, a period when nobody goes to the Alps because there is still too much snow. If uprooted in August or September it is still too hot to plant it successfully, while in October it is already too late, as the mountains are then covered with snow. Most tourists transplant the tree during their summer trips, which cannot be otherwise than prejudicial to success. The best method, therefore, of multiplying the plant is by seed. Some succeed very well by grafting it on *Pinus Strobus*, but propagation by seed, when it can

be done, is the best method. To be sure of obtaining the true species it should be imported direct from the Grisons or the Valais, as what is sold is often not of the true kind. The seed takes a year and a half to germinate, so that seeds sown in the autumn of 1881 will not come up until the spring of 1883. While the seed is below-ground, certain animals, such as

When the seedlings are up the wire netting is taken away, and the seedlings are pricked out. M. Davall has shown that the growth of *Pinus Cembra* is much more rapid in the mountains than in the plains. He sowed at the same time seeds at a great elevation on the mountain side, and at Vevey at an altitude of 100 metres above the lake, and he found that while the plants on

FIG. 12.—ANCIENT PINUS CEMBRA.

mice and squirrels, seek it out with avidity, and find it out with a persistence that would excite admiration were it not so disheartening to the cultivator. Our foresters sow the seeds in beds surrounded by strong planks thrust to the depth of 15 inches into the ground, and rising to an equal height above it. The seeds are sown thinly, and are covered with a few centimetres of soil, and then a wire trellis, the meshes of which are close enough to prevent the mice from entering, is fixed over the whole.

the mountain side had attained an average height of 2½ metres, at Vevey, during the same period, they had not attained 1 metre (3 feet 3 inches) in height. The Arolle does not dislike limestone or rocky soil; it prefers, nevertheless, a stiff and slightly moist soil. Several varieties are in cultivation, but none of them are equal to the type; *P. Cembra* var. *pumila*, and *P. Cembra* *pygmaea* are, however, interesting varieties. H. Corveon, Inspector, Botanic Garden, Geneva. [The illustration fig. 12 shows a specimen of this

tree growing some years since in Tyrol at an elevation of 6300 feet, and the trunk of which below the lowest branch measured between 6 and 7 feet in diameter. ED.]

Notices of Books.

Christowell : a *Dartmoor Tale*. By R. D. Blackmore, M.A. 3 vols. Sampson Low & Co.

When called on to notice in these columns a book treating of some horticultural or biological subject, it

The author has a story to tell, and his characters are made to tell the story. In some novels the story or plot is the main thing, and the delineations of character are quite subordinate. In other cases the reverse obtains. Between the two great classes there are innumerable transitions, so that it is often difficult to class a particular work, and fit it into its proper place. *Christowell* is, to our thinking, one of these intermediates; the plot does not arouse that breathless interest with which the gradual unfolding and ultimate culmination of some stories are accompanied; in fact, it is difficult at first—as well it may be—to divine what is the motive of the hero of the piece,

the consequence is that though we do not for a moment dispute all that the author says of her, we have no very urgent feeling of wishing to extend our acquaintance with her. True, she has special claims on our notice, as she can prune Vines and thin Grapes, but as it would seem under direction only; the feminine mind in gardening matters does not seem to be able to rise to an emergency, or to be able to deal with new and unfamiliar conditions. There is a villain who is most opportunely got rid of by the electric stroke—there is a country parson of the manual school, a capital sketch—there is a carrier—another well-drawn portrait—and there are various country gentlemen, poachers, sheep stealers, and other *dramatis persone*, who are made to play their parts efficiently. In dealing with humanity the author makes us know the Dartmoor peasantry and their ways and modes of thought and speech, while a vein of quaint and not ill-humoured satire runs through the book. In depicting natural scenery, the author without effort makes us feel the whiff of moorland air and the sweet fragrance of the wild flowers. But, as we have said, the chief interest for gardeners lies in the fact that the hero of the book is a gardener, and his gardening experiences are alluded to in almost every chapter. The author, indeed, knows how to handle the pruning-knife as well as he does how to wield the pen. Let us give some illustrations to prove the latter part of the statement :—

“The finest gardener that ever grew, knows well that he cannot command success, and has long survived young arrogance. Still, he continues to hope for the best; for the essence of the gentle craft is hope, rooted in labour and trained in love.”

Here is a description of a vineery and its contents :—

“It was a long low span-roofed house, with no side-lights and very simple, not even framed with rafters. . . . Here were the sweet obedience and the gay luxuriance of the Vine, than which no lovelier creature grows. Broad leaves spreading into pointlets waved and cut with crisp indenture, coving into or overlapping the ripple of each other; clear round shoots cresting up like swans and sparkling with beads of their own breath; infant bunches on the bend as yet, but promising to straighten as the berries get their weight; some bravely announcing Grapes already, some hoping to do so before nightfall, through the misty web of bloom; others only just awaking into eyes of golden dust, yet all alike rejoicing, shining, meeting the beauty of the early sun and arousing their own to answer it.”

The heroine, too, gets enthusiastic over her work, and is right in the main in her physiology, though perhaps she does give her imagination rather loose rein.

“Papa, I am sure there is nothing in the world half so beautiful as gardeners' work. What are jewellers, or watchmakers, or ivory-carvers, or even painters, to compare with a genuine gardener? The things that they handle are dead and artificial, and cannot know the meaning of the treatment they receive. But our work is living and natural, and knows us, and adapts itself to follow our desires and pleasures, and has its own tempers and moods and feelings exactly the same as we have. For people to talk about 'sensitive plants' does seem such sad nonsense when every plant that lives is sensitive.”

And here we take leave of *Christowell*, hoping we may induce some of our readers to extend their acquaintance with its pages, and feeling sure that among its other qualities they will not overlook or fail to appreciate the nervous style in which it is written.

FIG. 13.—PINUS CEMBRA IN THE VALLEY OF TURTMANN. (SEE P. 80.)

is natural for the reviewer to endeavour to find out what the author intended to do, how he has done it, and what are the general results to be inferred from the whole. The words, “What,” “How,” “Why,” “Wherefore,” and “Therefore,” may briefly serve to indicate the reviewer's ordinary method of procedure. He treats a book, indeed, much as a student engaged in an original investigation into the natural history of any subject would do. A similar course, modified to suit altered circumstances, may be followed in the present instance. It is not necessary, however, to inflict on the reader the details of the whole process, as would be required if a scientific analysis were to be attempted. In such a case how the reviewer arrives at his conclusions is of little interest to the reader, nor, provided they are sound so far as they go, does it concern the author himself.

and when at length it is revealed it is as human motives are apt to be, not sharply defined, but so mixed—“such a tangled web”—that it would need a very acute and impartial student of ethics to determine whether or not the hero, consistently and persistently, did the right thing or not under the circumstances. Without revealing too much—which would be unfair to the author—it may be said that the chief interest lies in the fortunes of a gentleman who, for reasons not here to be divulged, as they form the core of the book—has thought fit to retire, under an assumed name, into the seclusion of a Dartmoor hamlet, together with his daughter, and there, apart from crowds, to devote himself to gardening pursuits. The heroine of the book is beautiful of course—that we grant—but her personality is indicated by the author rather than made to assert itself;

— *Journal of the Royal Horticultural Society.*—The sixth volume of the *Journal* of the Society, containing the records of the proceedings from September, 1879, to August, 1880, has just been issued. It is a condensed report, bringing the narrative of the Society's work down to the date indicated. Its most valuable feature is the index to the principal plants exhibited and certificated. It is to be hoped that as soon as the arrears are overtaken means may be taken to publish the *Journal* with greater regularity, and make it more useful to the Fellows and more worthy of the Society. The speedy publication of the elaborate reports on the effects of the frosts of the last two winters is specially to be desired.

— *Commercial Law Annual.* (W. Cate, Curator Street).—In addition to the usual calendar matter this contains an abstract of various legal enactments, old as well as modern, and of interest not merely to legal practitioners, but to business men of all descriptions.

Orchid Notes and gleanings.

ORCHIDS FROM SEED.—It has always been understood that *Cypripedium Stonei* platyterium was, as its name implies, merely a form or an improved variety of *C. Stonei*. But why call it a "non-strosity"? (see p. 49). That it is a seedling form there is probably not much doubt, but as it is a variation from the original species it is very likely that seedlings from it will also vary, but some may be even better than it, and it is not unlikely that a large proportion will revert to the original. If "H. C.'s" suggestion is right, that Mr. Gedney acted wisely in not seeding the *Cypripedium* in question, Mr. Spjers must have acted unwisely in doing so, and has brought distress and probably death on a valuable plant. I think differently, and should have acted exactly as Mr. Spjers has done. I have ripened many seed-pods on *Cypripediums*, and raised seedlings from them, but never yet saw a healthy plant injured in the least. There is a small plant of *C. Hookeri* in our stove now bearing a seed-pod, the second one within two years; the first was broken off just before the seed ripened; and as another flower opened immediately it was set. Now another flower is coming up as if no seed-pod had been drawing sustenance from the plant—a small one in a 4 inch pot. Would "H. C." kindly bring evidence in support of his statement that seeding *Cypripediums* "is well known to bring distress and sometimes even death to very healthy plants"? Surely it is the nature of Orchids to bear seed, and propagate their species in that way, and I cannot understand a seed-pod killing a very healthy plant, although it might be like the proverbially "last straw" to one in the last stages of its existence. *J. Douglas.*

LELIA ANCEPS VAR. VEITCHII.—This variety was shown by Messrs. Veitch at the last meeting of the Floral Committee, and received a First-class Certificate. The segments of the flower are oblong acute, white, suffused with a lilac shade, and with the tips of a deeper violet. The lip is violet, with narrow purple lines and a yellow blotch at the base. To the eyes of some connoisseurs this is not so fine a variety as *L. anceps Dawsonii*, which has broader segments.

VANDAS are often subject to the reproach that they do not flower till the plant has attained a considerable size and age, but this delay is not always observable. A small plant of *V. tricolor* at Mr. Williams' at Holloway, about three years old, is now bearing flowers.

RENANThERA COCCINEA.—This grand old Orchid is seldom seen in flower, but I was pleased to meet with a nice young specimen in bloom at Benetton Rectory, near Salisbury. The plant is above 4 feet high, and has thrown a splendid spike of flowers, over sixty on the spike; it is very showy. Mr. Lampard attributes his success to fully exposing the plant at all times to the full rays of the sun, only shading just the pot. *A. O.*

MR. BLAKE'S COLLECTION OF ORCHIDS, at The Elms, Winterbourne, near Salisbury, is a very interesting one, grown and tended by Mr. Blake, who is a great lover of this beautiful class of plants, and takes great interest in matters connected with horticulture generally. When I had the pleasure of spending an hour or two with him recently I noticed the following in flower:—*Cypripedium igneum* and *C. villosum*, *Calanthe Veitchii* and *C. vestita*, *Lelia anceps Barkerii*, *L. autumnalis rosea*, *Lycaste skinneri*, *Masdevallia Veitchii*, *M. tovarensis* (over forty flowers on a plant in a 4½-inch pot), *M. Davisii*, *Oncidium varicosum*, *O. leucostomum*, *O. pubes*, *O. Cavendishii*, *Ptilanota fragrans*, *Odontoglossum crispum*, *O. Pescatorei*, *O. citrosum*, and *O. pulchellum* (many good varieties), *Sophronites grandiflora* (lovely varieties, well-flowered), *Zygopetalum Mackayi*. These made a very nice display, and I saw besides fine plants with good growth, showing flowers, of *Coleogyne cristata*, *Epidendrum macrochilum*, *Oncidium leucechillum*, *Odontoglossum gloriosum*, *O. cordatum*, *O. roseum*, and *O. citrosum*, *Lelia purpurata*, *Pendrobium formosum giganteum*, *Angreum sesquipedale*. They are all well done, and will shortly make a grand display; the growth of the

Vandas, *Saccolabium*s, *Cattleyas*, *Pleiones*, &c., shows that the treatment they receive from the hands of their enthusiastic owner is just what they require. I must not forget to mention a specimen of *Dionaea Muscipula* ("Venus' Fly-trap"); this plant is the finest grown specimen I have ever seen; it is in a 48 pot, growing upon a shelf in a temperature above 50°; it had over forty very finely developed traps, many measuring over 2 inches, and in splendid health. *A. O.*

THE VALUE OF RARE ORCHIDS.—When people begin to cultivate Orchids they are usually content with plants of the different favourite genera, without paying much attention to the merits of particular varieties. They procure representatives of, say, the various kinds of *Cattleyas*, *Lælias*, *Dendrobium*s, *Oncidium*s, *Odontoglossum*s, *Masdevallias*, *Phalenopsis*, &c., and if they get the different species nominally they feel satisfied, and can scarcely understand the course followed by many of the enthusiasts who form collections, and who often pay ten times the ordinary price for an exceptionally fine variety of some or other of the different favourite species, forgetting that these finest forms do not turn up every day, being simply the thinly scattered exceptions amongst the crowd of ordinary varieties that are imported, the chance of obtaining which adds no small zest to the risk incurred by those who import or who buy unfloured plants. It occasionally happens that amongst hundreds or thousands of ordinary varieties a few plants of an unusually fine form make their appearance, beyond which possibly nothing equal in colour and shape is seen for years; the result being that the variety is often divided and subdivided so far as it will permit, and still remains scarce. In confirmation of this may be noticed the fine plant of *Lælia elegans* Turneri, bearing thirteen flowers on a spike, shown by Messrs. Veitch at the August meeting of the Royal Horticultural Society; this had been grown from a single bulb which is now decayed and has been cut away, leaving eleven others in single file that have sprung from it, gradually increasing in size and strength until the leader formed last year produced the unusual number of flowers named. But it must not be forgotten that from the single bulb it has taken eleven years to bring the plant to what it is. This will show those who have not considered the subject how it is that rarities in Orchids command a high price.

ODONTOGLOSSUM MIRANDUM.—This plant, referred to at p. 59, is in flower with Mr. Bull, at Chelsea, and his plant is probably the only one that has flowered in Europe—if there is another one of the same kind in existence. [Mr. Warner has a plant. Ed.] It has not been sent to Professor Reichenbach, because there is but one spike, and Mr. Bull is loth to cut it. It may be a hybrid from *O. Lindleyanum* crossed with some deeper and better formed yellow-ground species. Whether it is a hybrid or species it is a very handsome and desirable *Odontoglossum*. *J. Douglas.*

VANDA LAMELLATA VAR. BONALLII is one of the newer varieties, with relatively small primrose and buff coloured flowers—an unusual but pretty combination of colours. At Mr. Williams' nursery a plant of this variety has lately produced eight spikes.

COLEOGYNE MASSANGAENA.—This is now in flower at Mr. B. S. Williams' establishment at Holloway; its pendulous racemes of pale buff flowers with a brown coloured lip are very pretty. We hope shortly to give an illustration of this plant.

DENDROBIUM LUTEOLUM is one of the less conspicuous species, but withal so chaste and pretty in its pale primrose flowers that not many, we imagine, would be disposed to discard it. It may be seen just now at Mr. Williams'.

COLEOGYNE BARBATA.—It was too bad of Mr. Douglas to put up a "caution" notice about this Orchid. If he had contented himself by stating it was not to his taste, or that, as I am informed is the case, it is slow to flower, no one could have raised any objection, as it would then have been understood to have been a personal matter; but those who care to see the plant at Mr. Bull's or Mr. Williams' just now will not at all agree with Mr. Douglas, while some will find the contrast between the pure white segments and the sepia or smoke-coloured lip as very effective. *A. O.*

The Kitchen Garden.

ORDERING SEED.—Now that the season for ordering a supply of seed for the current year's sowing has arrived, and with it a goodly number of trade catalogues, each containing lists of the best and most approved varieties of the different kinds of kitchen garden seed, it may not be inopportune to indicate a few of the leading sorts indispensable in every establishment. Therefore, with catalogue in hand, let us repair to the seed-room and examine the contents of the individual drawers, entering, as the inspection of the stock of seed remaining in store since the preceding year is proceeded with, in the catalogue or order-sheet, the quantities required:—*Asparagus*: *Conover's Colossal*. Broad beans: *Seville Longpod* and *Taylor's Broad Windsor*; and in the dwarf and tall sections *Canadian Wonder* and *Champion Runners*, which are the best. *Beet*: the *Fine-ape Short-top variety* may be depended upon as possessing all the essential points of this esteemed root. *Broccoli*:—*Spring varieties*: *Brimstone*, *Chappell's Cream*, *Frogmore Protecting*, *Carter's Champion*, *Cooling's Matchless*, and *Cattell's Eclipse*; for autumn use: *Veitch's Self-protecting*, *Grange's Early White Cape*, and *Early Purple Cape*; and for the present season, *Snow's Winter White*, *Backhouse's Winter White*, and *Early Penzance*. *Borecole* or *Kale*:—*Cottagers' and Dwarf Curled Scotch*. *Brussels Sprouts*:—*Imported, and Scrymger's Giant*. *Cabbages*:—*Wheeler's Imperial*, *Carter's Heartwell Marrow*, and the *Rosette Colewort*. *Savoy*s:—*Drumhead*, *Dwarf Green Curled*, and *Early Elm*. *Carrots*:—*Altringham and Long Red Surrey* are among the best long, and *Early Nantes* the best short horn varieties. *Of Cauliflower*s the *Early London*, *Walcheren*, and *Veitch's Autumn Giant* are unquestionably the three best. *Celery*: *Leicester Rod* and *Turner's Incomparable White* are excellent kinds. *Endive*:—*Batavian Broad-leaved* and the *Green and Moss-curbed varieties*. *Leeks*:—*Musselburgh and Carentan*, two fine varieties. *Cabbage Lettuce*:—*All the Year Round* and *Victoria* for summer, and *Lee's Immense Hardy* and *Hammersmith Hardy* for winter and spring use. *Cos Lettuce*:—*Paris Green* and *Paris White* for summer, and *Hick's Hardy* and the *Black-seeded Bath Cos* for winter and spring cultivation. *Onions* for spring sowing:—*The Reading*, *Banbury*, and *White Spanish* are three fine large varieties, and for long-keeping qualities *Jamies' Keeping*, *Danver's Yellow*, and *Deftford or Strasburg*, should be included; for autumn sowing: *The Queen*, *Early White Naples*, and *Giant White Tripoli*. *Early Peas*:—*Sutton's Bijou*, *Maclean's Little Gem*, and *William I.*, the two former from 12 to 18 inches high, and the latter 3 feet high, are all good varieties for early work, either planted in pits or grown in pots; and for the same purpose, for sowing out-of-doors *William I.*, *Sutton's Ring-leader*, *Emerald Gem*, and *Day's Early Sunrise*. As second early and mid-season varieties we would recommend *Dickson's Favourite*, *Laxton's Supreme*, *Carter's Stratagem*, *Culverwell's Telegraph*, and *Carter's Telephone*; and the late section should include *Veitch's Perfection* and *Ne Plus Ultra*—the latter the finest late Pea in cultivation. *Turnips*:—*Early Purple-top Munich*, *Early Snowball*, and *Carter's Jersey Marrow*. *Potatoes*:—*Kidney*, *Hammersmith* and *Myatt's Ashleaf*; *Round varieties*, *Champion* and *Schoolmaster*; and among *Vegetable Marrows*, *Moore's Cream* is the best.

SEED SOWING.—As soon as the condition of the ground will permit of its being done a small sowing of *Early Nantes Horn Carrot* should be made in a south border. Before drawing the drills the ground should be dusted over with some new soot, which will be the means of keeping the roots free from the attacks of wireworm. A small sowing should also be made in the same situation of *Early Purple-top Munich Turnips*, and *Early White Naples Onions*—the latter for drawing young.

FORCING DEPARTMENT.—A good supply of warm dung and leaves (about three parts of the latter to one of the former) should be kept in readiness for making the linings of hotbeds on which *Potatoes*, *Carrots*, &c., are growing, as a means of maintaining a gentle heat therein, also with which to make up fresh beds for similar purposes where necessary. Another batch of

Potato-sets (in quantity according to the extent of bed or pits to be planted) should be put in 3-inch pots or boxes in leaf-mould, and placed in an early vinery or Peach-house to start them into growth, and when they have made shoots 2 inches long they should be planted on the beds previously prepared for them in the manner described in the Calendar for December 10, p. 755, vol. xvi. Where Seakale is not forced in the Mushroom-house another batch of crowns should be covered with pots or boxes, and then with about 3 feet thick of fermenting leaves from the leaf-coop. A batch of Kharbar crowns may be treated in a like manner. No time should now be lost in making a sowing on a hotbed or in boxes to be placed in heat, of Early London Cauliflower, Brussels Sprouts, and Cabbages, including a pinch of the Red Dutch, also a small sowing of Cos and Cabbage Lettuce, and a pan of the most approved variety of Celery for early use; and as soon as the plants appear through the soil they should be placed near the glass and in a less warm temperature, where they can have a little air to prevent their becoming drawn and making a weakly growth. Keep a good supply of good soil in the potting-shed out of the reach of inclement weather wherein to raise French Beans, and subsequently to top-dress them.

MUSHROOMS.—Collect horse-droppings, and keep them spread out thinly in a dry shed for a few days, with which to make succession-beds, which should be formed as soon as the necessary quantity of droppings for that purpose has been collected and be beaten as firmly together as possible. A dipping thermometer or "test-stick" should be inserted in the bed, and when the heat has declined to 75° or 70° it may be spawned, inserting pieces about half the size of a hen's egg under the surface of the beds about 6 inches apart, and then covering with half an inch of such droppings pressed firmly down, after which the surface of the bed should be covered thinly with finely-sifted loam of the same temperature as the bed, and beaten firmly together with a spade. A rather moist atmosphere, with a temperature of from 55° to 66°, should be maintained in the house, but in the absence of fire-heat it will not be necessary to distribute moisture in the house. *H. W. Ward, Longford Castle, Wilts.*

—The remarks of your correspondent "Visitor" respecting Mr. Laytham's success in growing the above ought to be sufficient to convince any 60° temperature man that his own practice is not absolutely necessary to ensure the best results, and that he may, if he chooses to divest himself of his crotchets and old-fashioned ideas, obtain crops of Mushrooms quite up to "par" by a great saving of fuel and, I would add, labour also. To suppose that a practice which was successfully adopted by our great-grandfathers must necessarily be an orthodox one, is little short of idiosyncrasy, and the sooner we awaken to this fact and cease to be fettered by what are frequently termed old-established principles the better. Mushrooms, like a good many other things, may be grown and produced in abundance without going to any great expense or without any special qualifications on the part of those who undertake their culture.

Although I am not prepared to say that good crops may not be obtained with a temperature of from 60° to 65°, I have on the other hand no hesitation in saying that equally good, in fact better, crops may be had with 15° or 20° less, and for this reason beds in a lesser degree of heat continue in a bearing state for a greater length of time. We ourselves are quite as successful in growing Mushrooms as we need wish to be, and go to very little expense or trouble in their culture. When a new bed is required the cart is simply despatched to the dung-yard, and as much hot short dung brought away as is wanted; the bed is made up, spawned, and soiled over forthwith: should the dung, however, happen to be, as it sometimes is, a little too hot, a portion of the old bed is mixed up with it: from this it will be seen that a few weeks' preliminary collecting and turning over of droppings is not with us a *sine qua non*. To be successful in growing Mushrooms there are two important points which cannot be over-rated or too closely adhered to, viz., new spawn of a good quality—this can invariably be procured from any house in the seed trade of high standing—and sufficient heat in the bed to give the spawn a good start; if one of these two points is more important than the other it is that of new spawn: use old, and in nine cases out of ten failure is a foregone conclusion. *J. Horsfield.*

Peaches and Nectarines.

THE earliest varieties in the early house will by this time be pretty well set, and may now have a gentle syringing with tepid water twice daily on bright days; on dull days once will suffice for the present. They will also very soon require disbanding, a little of which may be done daily, going over the terminal and strongest shoots first, in preference to finishing a tree at once. Give them a thorough watering at the roots with tepid water, for if allowed to get at all dry, many of the fruits will drop off as soon as set. Keep the temperature about the same as already advised. The difficulty this season has been to keep the night temperature low enough, for with a little air on all night very little fire-heat has been required. If not done, a third house may now be started according to directions given for early houses, and a fourth one may be prepared for starting by the end of the present month. Keep late houses as cool as possible by keeping the ventilators open to the fullest extent night and day. Examine the borders, and if they are getting at all dry give a thorough watering with cold water. *J. Wallis, Keele Gardens.*

Grapes and Vineries.

THE CHATSWORTH GRAPE.—The remarks of "W." (p. 17) respecting this Grape tempt me to write a line or two in its behalf. If what "W." states as to its "dingy red" colour on the two occasions on which it has been before the Fruit Committee of the Royal Horticultural Society be literally correct, it is quite clear that that body have not had it put before them in its best form. It may possibly interest "W." to learn that with the right treatment it can be coloured quite as well as Alicante, Hamburg, or other black varieties. There is an impression abroad that it will not hang, or at least a certain amount of scepticism as to its keeping properties: this I will endeavour to dispel by stating that the bunches Mr. Ward saw in the Grape-room here and commented on at p. 852 of your last volume, were coloured up to the footstalk and fully ripe at the beginning of August last. On October 8 they were cut and bottled, and on December 18—rather more than a fortnight after Mr. Ward, who wrote of the berries as being "large, plump, and finely finished," saw them—they were cut and sent to the dinner-table, and were then quite plump and fresh. Now the inference to be drawn from the above is obviously this—had the bunches in question been ripened six weeks later they would have kept very well till February or March. Of course there is no disguising the fact, that in its keeping properties alone it is no match for either Alicante or Lady Downe's, but in flavour and other points it is, in my opinion, much superior. *J. Horsfield, Heytesbury.*

GRAPEB NOT KEEPING.—"Grapes are selling badly, and showing signs of indifferent keeping" (see Covent Garden report, p. 60). In the matter of keeping this remark is quite in unison with our experience here. I never saw Lady Downe's keep so badly during eighteen years' experience with the same plant in our late house. I must say that the berries are not quite so well thinned out as they ought to have been, and the berries are most likely to become mouldy when the leaves are falling; but even after all the leaves were removed many sound berries became mouldy, and infected others. *F. Douglas, Loxford Hall.*

PEARSON'S GOLDEN QUEEN GRAPE.—We have this Grape growing here on its own roots, and in-arched upon Lady Downe's seedling. The house in which they are growing is all of Lady Downe's except one Vine of Golden Queen on its own roots, which is planted at the coolest end near the door at the end of the range; and another which is in-arched on a Vine of Lady Downe's near the other end of the house. The rafter is about 24 feet in length, and the Golden Queen was in-arched at about 10 feet from the bottom. The Grapes on both Vines finished beautifully last year, both bunches and berries, however, being larger on the Lady Downe's stock than on its own roots. The latter, however, was far superior to the former as regards flavour, being more crisp and juicy. I consider the Golden Queen a second class Grape, but not quite at the top of the class. *John Garrett, Whittinghame Gardens, East Lothian.*

Plants and their Culture.

ROSES.—Of stove flowering subjects at this season of the year, *Thyracanthus rutilans* is one of the most distinct and beautiful. Grown as a standard, it shows itself to greater advantage than in a dwarf state. Care should therefore be taken of any young stock with which to make nice heads for another season. Give them a favourable position after blooming, potting them after a little rest. Poinsettias that have ceased to be attractive may be laid on their sides in a dry place in a temperate-house. *Begonia insignis*, where past its best, may be moved to a cooler house, casting off any plants that are getting old. This may also apply to *Eranthemums*, when out of flower, keeping only sufficient stock of such things as these to ensure next winter's supply of young stuff. If *Allamandas*, *Bra-gavilleas*, or the climbing *Clerodendrons* are required in flower early in the summer, the most promising should be pruned at once, and when showing indications of fresh growth the balls should be reduced, if the plants are in large pots. Where a size larger pot is contemplated, it would not be advisable to reduce much, beyond removing any sour soil not occupied with healthy roots. Considerable advance has been made of late years in the genus *Amaryllis*, seed of which can now be purchased at a moderate price. If sown now, advantage will be gained by getting a long season's growth—in fact, they need not be rooted till they have once attained to a flowering stage. All of this class of plants are attractive, good results may therefore be reasonably expected. Keep the temperature of the stove proper still at a minimum—bad weather may yet be in store for us. Economy in fuel should be practised now—later on, when more in request to maintain active growth, it can be better expended.

GREENHOUSE.—A few plants of *Solanum* of the capsicastrum varieties of a good strain may be placed in a gentle heat, an early batch of cuttings can then be had, dispensing with old scrubby plants. *Bouvardias* and *Tree Carnations* may be treated in like manner. *Cytisus* advancing into flower must be watered liberally, occasional doses of weak guano-water would be beneficial. *Lachenalis* should be watered freely now they are pushing up their spikes. Keep this structure well ventilated, remove all decaying foliage, and watch for fly, which, with the mild weather we are having, soon gains a foothold.

PITS, &c.—With a little heat, a small sowing of Ten-week Stocks may be made for flowering in pots. An early sowing of *Rhodanthe* will be serviceable, and give a pleasing variety when in flower. Well established pot Roses may be placed in heat now with good results, choosing well-tried kinds. *James Hubson, Gunnersbury House, Acton.*

CORREA CARDINALIS.—Among greenhouse plants this is one of the most useful, flowering as it does all through the depth of winter, when it quite lights up a stage with the rich glow of its blossoms. These are long and tube-shaped, and are borne freely on the ends of its small twiggy shoots, the only drawback to the plant being its thin spare habit and the peculiar curl of the foliage, which latter gives it the appearance of being in a rather unhappy condition. The curled or arched leaves, however, are quite natural to it, as they are always the same even in the most healthy plants, which have them very glossy and bright looking without downy coating, such as seen on the foliage of some of the others. Being a weaker grower *C. cardinalis* is generally grafted, as it is found to do best on a stock, the freest sort being chosen for the purpose of working it on. The soil most suited to grow this *Correa* is in fibry peat, which should be used somewhat rough, and not pressed so firm as is usually done in the putting of Heaths, as the roots, being larger, cannot ramify freely. To get plenty of growth in the spring, on which their blooming depends, the plants should be placed in a house where they can be kept a little close and have the syringe drawn over them on the afternoons of bright sunny days. Later on in the season the plants will be greatly benefited by being stood out-of-doors, as then, with the exposure to more air and full light they get, the young wood is ripened and hardened up better, and consequently flower with more freedom. *J. S.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan 23	Sales of Rare Lilies, and Other Bulbs, at Stevens' Rooms; and at the Auction Mart, by Frothergill & Morris.
WEDNESDAY,	Jan 25	
THURSDAY,	Jan 26	Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY,	Jan 27	
SATURDAY,	Jan 28	Sale of Plants and Bulbs, at Stevens' Rooms.

It will no doubt be readily admitted that the best time to PLANT DECIDUOUS TREES of all kinds is soon after the leaves have fallen. It may hardly be necessary in all cases to wait for this event taking place, but where planting has to be done upon a large scale the planting season has necessarily to be considerably extended, and planting may be successfully performed at any time from the end of October until the beginning of March, when the condition of the weather will admit of its being done. Few seasons have hitherto proved so favourable for planting operations as the present. It will also be admitted that the best method of preparing the soil for the reception of young trees is to dig or trench it at least two spits deep, and if poor to give it a good dressing of manure or fresh soil if it can be obtained, which is not often the case. We may also here allude to what is possibly the worst method of planting trees, and which is unfortunately the one too frequently practised, viz., that of digging a hole or pit so exceedingly small that the roots of the tree can with difficulty be crammed into it. This method is infinitely worse than what is known as the T form of planting, which is sometimes practised on poor rocky soils in Scotland and elsewhere with tolerable success; and where anything in the form of digging or trenching is out of the question.

Trees planted in this way must necessarily be of comparatively small dimensions. The operation itself is exceedingly simple, and consists of the operator merely making a slit in the turf with his spade, and then inserting the same at one end of the slit, at right angles with it, and by pressing down the handle of the spade the slit will be forced to open more or less, when the assistant passes the roots of the tree into the opening thus made, and a slight amount of pressure with the foot is all that is required to steady the tree, care being taken to leave it in an upright position. By this method an immense number of trees can be planted by a man and a boy in a comparatively short time.

In cases where pits or holes are dug out for the reception of trees, the same should always be of considerable dimensions as regards width as well as depth, and corresponding, of course, with the size of the trees about to be planted, but always sufficiently large to admit of the roots of the plants being spread out to their full extent, and sufficiently deep to admit of a portion of the best of the soil being placed in the bottom of the pit, in order to raise the bottom to the requisite height, and to allow the roots of the tree a portion of friable material into which to extend themselves.

But it is to the planting of trees in properly prepared soil—that is, in soil which has been drained and dug, or trenched, that these remarks are intended principally to apply. Too deep planting of trees on such prepared soil has been no doubt deservedly condemned; but it is to be feared that some planters in their endeavours to avoid Charybdis have fallen upon Scylla, and on some kinds of soil too shallow planting is as necessary to be avoided as too deep planting. On heavy and imperfectly drained land deep planting should by all possible means be avoided, and the trees may in such cases with advantage be planted on a slight mound, or slightly elevated above the level of the surrounding soil; while on very light land the converse of this practice should rather

be followed, as in the event of continuous dry weather setting in several inches of the surface of such soil becomes perfectly desiccated, and before the roots of recently planted trees can penetrate the soil to a greater depth many of them must inevitably perish. Many years ago we had occasion to know something of a large estate, a portion of which consisted of very light poor land, and a considerable part of this about the time alluded to was being planted with forest trees of various kinds, chiefly Larch, and the planting of which was entrusted to an old trustworthy man of great experience in such matters, whose invariable practice was to plant somewhat deeply, and in addition to this to form, as it were, a shallow basin round each tree, as is done in the light soil at Kew, thus securing for it as ample a share of the rainfall as was possible, or, at all events, to effectually prevent the same running from it during sudden or heavy falls of rain. This practice was generally attended with every success that could reasonably be expected, considering the nature of the soil and the prevalence of ground game. But a change happened to occur in the management of the estate, and the new manager, or agent, chanced to be one of those who fancy they have nothing to learn, and who had possibly been accustomed to land of a different character. So he demurred to this method of tree planting, declined to discuss the matter with the old planter, and peremptorily ordered him to plant as he (the agent) desired, which was accordingly done. The weather during the following spring months proving dry the result was in all respects a complete failure.

— ROYAL HORTICULTURAL SOCIETY.—The Council recommend for election at the annual general meeting, to be held on February 14, in the places of the late Dr. Denny, and of A. Grote, Esq., and Sir Chas. Strickland, Bart., who retire—Edmund Giles Loder, Esq., J. H. Mangles, Esq.; and William Lee, Esq., Leatherhead. The Council also nominates the following gentlemen as officers for the year:—President, Right Hon. Lord Aberdare; Treasurer, William Haughton, Esq.; Secretary, Major F. Mason. Expenses Committee-men: Lord Alfred S. Churchill, Major F. Mason, and William Haughton, Esq.; and Auditors: R. A. Aspinall, Esq.; John Lee, Esq.; Harry J. Veitch, Esq.

— ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—We have received the schedule of prizes to be offered for competition at the great International Horticultural Exhibition, to be held under the auspices of this Society in Edinburgh, on September 13 and 14. Since the former exhibitions were held in Edinburgh the new Waverley Market has become available, and is pronounced to be the finest hall for shows of this kind in the United Kingdom. The Council are naturally anxious that this exhibition should excel its predecessors, and that it may do so it is necessary they should be in a position to offer such prizes as will induce all the celebrated growers in the kingdom, and abroad, to send exhibits. The Council accordingly appeal to all those interested in the success of this exhibition for their cordial and liberal support. Subscriptions will be received by Mr. JOHN STEWART, W.S., 4, Albany Place, the Secretary; Mr. WILLIAM YOUNG, 33, South Bridge, the Assistant-Secretary; Mr. P. NELL FRASER, Rockville, Murrayfield, the Treasurer of the Society; or by any nurseryman in Edinburgh. Schedules may be obtained from the Assistant-Secretary.

— RAISING SEEDLINGS.—Mr. PETER HENDERSON's method is thus described in the *American Agriculturist*:—"Mr. PETER HENDERSON having hit upon a method which greatly increased the certainty with which he could raise seedling plants, not only of such rapidly growing things as Cabbages, but of slower starting greenhouse plants and of shrubs, employed it in his own establishment to his great advantage. It is very simple, as most valuable things are. In preparing his seed-beds, or seed-boxes—1st,

he puts down a layer of good loam, run through a half-inch sieve, and patted down moderately firm. Over this about one-fourth of an inch of dried sphagnum—common peat moss, such as is used for packing, thoroughly dried, and run through a wire sieve about as fine as a mosquito-wire gauze—this powdered moss, about in the condition of fine sawdust, being evenly spread. Upon this moss is placed a coating of loam about three-fourths of an inch thick, and well levelled. The seed is sown thickly on the loam, pressed down by a smooth board, and fine moss sifted on, sufficient to cover the seed, and the whole watered with a fine rose. The top layer of moss keeps the surface always moist, preventing all drying and baking, and allows the young plants to easily reach the light. The layer of soil below it affords nourishment to the seedlings, which, as soon as their roots reach the layer of fine moss below, form a mass of fibrous roots. No one familiar with raising seedlings need to have the advantages of this method pointed out."

— THE "FLORIST AND POMOLOGIST" for January, which remains under the management of Mr. MOORE, opens with a good plate of *Lilium Parryi* and *L. polyphyllum*. Mr. BARRON continues his serviceable articles on Vines and Vine culture, accompanied by woodcut illustrations. It is to be hoped that this excellent series of articles will be reprinted. A new feature of this old-established periodical consists in the "Register of Novelties," in which short descriptive notes of all the principal novelties in the various departments of horticulture are comprised.

— THE "BOTANICAL MAGAZINE" for this month opens with a good figure of the handsome *Pitcairnia corallina*, remarkable for its long racemes of crimson flowers. *Abelia spatulata* is a shrub with funnel-shaped flowers, like those of *Weigela*, but green; *Lespedeza bicolor*, a beautiful hardy shrub, with pinnate leaves, and long, many-flowered racemes of small, reddish, papilionaceous flowers; *Saxifraga diversifolia*, a species with leaves like a Violet, and terminal loose cymes of yellow flowers; *Cambesidea i paraquayensis* is a Melastomaceous greenhouse shrub, with rosy-lilac flowers.

— THE "BELGIQUE HORTICOLE" for August—October, which has just reached us, contains the very useful enumeration of "New Plants of 1880," arranged according to their natural orders by M. A. DE Vos. The plants figured are *Anoplophytum incarnatum*, *Echmea Glaziovii*, and *Montbretia crocosmiflora*.

—"JOURNAL OF BOTANY."—It is proposed to issue a complete index to the *Journal of Botany* from the commencement. We trust sufficient support may be afforded to the conductor to carry out this greatly needed work; but in matters of this kind, though I admit the utility, few are found willing to contribute to the expense, which must be considerable.

[—"ILLUSTRATION HORTICOLE."—The last issued part contains coloured figures of various foliage Begonias, of which we shall speak elsewhere, as also of *Masdevallia Shuttleworthii*, *Gynura aurantiaca*, *Bouvardia Alfred Neuner*, *Rose Guillaume Gillemot*. The text contains articles by MM. JOLY, RODIGAS, DELCHEVALERIE, and others.

— ERICA HYEMALIS ALBA.—We inadvertently omitted to state last week in our report of the meeting of the Floral Committee that Mr. KINGHORN received a First-class Certificate for this plant. It is a white-flowered sport from the valuable and popular *E. hycmalis*, and being a thoroughly good novelty, we are the more anxious that it should have its due reward. It seems to be quite fixed in character, as Mr. KINGHORN has several small plants all true to the type of the plant shown; and no doubt, being a real white winter-flowering Heath, it will be much sought after.

— THE CANTALOUPE MELON.—According to an article in *Les Mondes*, transferred to the *Belgique Horticole*, this originated in the gardens of a country house called Cantalupo, near Rome, frequented by the Popes in the summer months. The gardener in the time of Pope INNOCENT VIII. was one THOMASSO, a man of great repute in his profession. Under

[FIG. 14.—BOMAREA SHUTTLEWORTHII: FLOWER-SEGMENTS ORANGE-SCARLET AND YELLOW. (SEE P. 76.)

THOMASSO'S guidance the Pope became a connoisseur in Melon growing, and pointed out to his guests the signs of ripening in a Melon when the stalk begins to crack away from the fruit.

— **BEST WINE.**—M. AUGUSTE DELEUIL brings under notice wine made from a variety of red Beet. Beet has for long furnished both sugar and spirit, but now, in view of the ravages of the Phylloxera, it is proposed as a substitute for the Vine in wine manufacture. The gentleman above named, whose address is Gardanne, near Marseilles, offers to supply agriculturists gratuitously with seed. He tells us that the wine is as good as the wine of Southern France, which is not saying much.

— **THE EPPING FOREST NATURALISTS' FIELD CLUB** has issued another part of its *Transactions*, containing useful hints on the formation of a local museum, interesting reports on the exploration of the earthworks known as Amblesbury Baris, by General FITZ RIVERS; and on the origin of the British Flora, by Mr. BOULGER. The record of the various meetings is pleasantly given, and not too discursively, while the account of the excursion to Grays, with the accompanying photograph, may be taken as models of what such things should be, and must contribute to the members increased knowledge of the district they inhabit.

— **HOW TO PROFITABLY IMPROVE OUR SOILS.**—This is a brief pamphlet, by Dr. TAYLOR of the Ipswich Museum, on the nature of soils and the means to be taken to increase their productiveness. Rotation and manuring are dealt with, and the use of artificial manures advocated. The indiscriminate and injudicious use of these substances, however, would make things worse rather than better, and the exorbitant prices sometimes asked even for the best would render their use anything but profitable to the farmer, especially as he has no control over the seasons. Every farmer should try experiments on a small scale before embarking on large ventures.

— **NEMOPHILA INSIGNIS IN JANUARY.**—It is rarely that we see this lovely annual in flower out-of-doors in January from autumn-sown seed. Mr. KING, gardener, Wolsley Grange, Esher, is in the habit of sowing a bed early in September, in order to raise plants for planting-out in the autumn to flower the following spring. Last September a bed was sown as usual, and the surplus stock not required for planting out are now in full flower in the seed-bed—an unusual occurrence in January.

— **NORTH MIDDLESEX NATURAL HISTORY ASSOCIATION.**—A natural history society has just been established at Holloway under the above title, the objects of the Association being the formation of a natural history museum, and a library for reference and circulation among members; also the diffusion of natural history knowledge by means of lectures, papers, discussions, &c. It is also proposed to organise field excursions during the summer months. The meetings are held every Tuesday evening between the hours of 8 and 11 o'clock P.M. Further information relating to the Association may be obtained upon application to the Secretary, Mr. CHARLES M. ALLEN, 26, Ingleby Road, Grove Road, Holloway, N.

— **GARDENIAS FOR PARIS.**—The business that goes on in garden produce, including both flowers, fruit, and vegetables, between this country and France is generally supposed to be all on one side; climate and the price of labour being entirely in favour of our neighbours. But there is at least one exception. Mr. LADDIS, the leviathan flower grower, is, we understand, this winter sending Gardenias to Paris. These fragrant favourites, as known to those who have had experience in their cultivation, are terribly stubborn in refusing to open their blooms in the depth of winter; but at Bexley they have this winter been gathered six days per week.

— **HAILSTORM INSURANCE.**—We learn from the report of the directors of the General Hailstorm Insurance Society, Norwich, presented at the annual general meeting held on January 7, that the results of the last year's business were more favourable than in the year 1880, as notwithstanding the continuance of agricultural depression and the inevitable diminution of business, yet the balance on the year's

transactions was a favourable one. The falling off in the amount of business arose partly from the unusual weather up to the beginning of harvest, and the decreased breadth of corn grown, but mainly to the great depression in agriculture. And it is a matter of sincere regret that of the large number of old insurers who received heavy compensation for the disasters of the year 1880, only about 60 per cent. of them continued their insurances in the year 1881. The Society was established in the year 1843, and it has during the long period of thirty-eight years held on its beneficent career, giving, we believe, general satisfaction to those connected with it.

— **MYRTLES COVERED WITH BERRIES.**—Seldom have the common forms of Myrtle been so profusely covered with berries as they are this season. Large plants in good health, with their leaves a deep green, and thickly covered with berries, are not to be despised for conservatory decoration at this season, among Camellias, Cytisus, and other spring-flowering plants. The deep purple bloom upon the berries renders them especially interesting, and reminds one of a Sloe bush in autumn covered with fruits. Those who have ever seen the large pyramid specimens at Lowther's lastle will be able to form a judgment as to the appearance of such plants when thickly set with berries at this season.

— **CYDONIA JAPONICA AS A BUSH SPECIMEN.**—Every one is familiar with this old-fashioned plant as seen grown against the walls of cottages during the early spring months, which it adorns with its large scarlet blossoms; but a huge bush of it, 30 feet in circumference, in full blow in the middle of January is a rare sight indeed. The specimen alluded to is in the grounds of J. P. CURRIE, Esq., Sandown House, Esher, where, from its conspicuous situation and the brightness of its numerous open blossoms, it is at present an object of great attraction, and is much admired. The specimen is in the centre of a triangular figure in grass, from which three walks radiate in different directions, and comes in for no small share of admiration from visitors who are permitted within the grounds. The great drawback to what would otherwise be a remarkably handsome floral display is the want of foliage to show off the bright scarlet blossoms, which one can hardly believe to be real without taking a second look.

— **NAMES OF HERBS.**—We learn that Mr. BRITTON'S reprint of TURNER'S *Names of Herbs*, 1348, with full indexes and determinations, is ready for publication.

— **STRELTZIA REGINA.**—There are many ardent horticulturists who have a desire for plants and flowers out of the common, and to such this old subject will tend in some degree to satisfy their ambition. It is the flower that is peculiarly striking, being borne upon the terminal points of self-supporting spikes, and composed of large orange petals, in the centre of which is a sword-like sheath of purple, which grows more beautiful in form and colour as you examine it minutely. A fine plant, bearing three strong flower-spikes, is now to be seen in the conservatory of J. F. EASTWOOD, Esq., Esher Lodge, Surrey. In Mr. COLLINS' hands the plant is flowered very successfully, notwithstanding that it is somewhat difficult to bring about this desirable condition.

— **EUPHORBIAS IN SMALL POTS.**—Fine plants in small pots are a sure indication of high cultivation, and seldom fail to command that need of praise which is due to superior skill and attention. *Euphorbia jacquiniiflora* is a plant so well known and so commonly grown that there is very little left to say about its cultivation. There are exceptions, however, to all rules, and when one meets with examples of unusual excellence, such as Mr. COLLINS has succeeded in growing at Esher Lodge, Surrey, during the past season, they certainly deserve a brief notice. Mr. COLLINS has grown his plants, or rather the majority of them, in small 48-pots, with two shoots to each plant, and with 15 inches in length of flowering stem to each shoot. The plants have been grown from cuttings struck during the past season.

— **THE SEASON.**—A correspondent sends us from Taunton a shoot of Horse Chestnut, with the outer bud-scales all fallen, and the young leaves sufficiently expanded to show the inflorescence, which has

already attained a length of about half an inch. Some Horse Chestnuts are invariably much in advance of their neighbours. It is not stated whether this is the case in the present instance.

— **FUCHSIA CORYMBIFLORA FOR LARGE CONSERVATORIES.**—Those who have large conservatories to fill and who do not already possess this plant should make its acquaintance as early as possible, and grow it on as a standard or in any other form that may answer the nature of the position that the plant is intended to occupy. At Garrick's Villa, Hampton-on-Thames, Middlesex, we lately saw two fine standards from 6 to 8 feet high, grown by Mr. SPENCER, and which are found very useful for the embellishment of the large conservatory there. The plants are sometimes stood out-of-doors during the summer months, but it is as conservatory ornaments that they shine most.

— **DRAECINA TERMINALIS RULRA CUT DOWN.**—It will be no exaggeration to say that there is no plant of its kind more largely employed for decorative and furnishing purposes than this *Draecina*. Small plants of it from 18 inches to 2 feet in height are common enough, and pretty objects they are too, when in good health, but "bushes" of it are the exception, not the rule. And yet bushes would be found a great boon for vase or basket-work. Where plants have been destroyed by exposure to cold or other circumstances incident to furnishing they may be cut down sufficiently low to get "three breaks," which, when they have grown the necessary height, will make handsome bushes for a pair of vases, or a single plant will make a good centre for a basket.

— **BEGONIA NITIDA.**—Among winter-flowering plants there are few at this season that can compare, all things considered, with this fine old plant, either for cutting purposes, or for arranging with choice fine-leaved plants which its presence brightens up considerably, or for training up the back walls of plant stores, or indeed any house where a temperature of from 65° to 70° is regularly maintained. For cutting purposes, where there is room to spare, it is best to plant out, by which means a great wealth of flowers are obtained in winter. The plant is, however, amenable to any system of cultivation, and perhaps it is grown in its most useful form upon single stems in 4-inch pots and dotted about the plant stove or the house, where its charming heads of white flowers, with orange centres, has a distinct effect from most other things that come into flower at this season.

— **THE WEATHER.**—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending January 16, issued by the Meteorological Office, London:—The weather, though very free from rain, has been exceedingly gloomy, with much mist or fog. The temperature, has continued above the mean, the excess varying from 4° over the greater part of England to 7° or 8° in Ireland and Scotland. The maxima were very high for the season, the thermometer rising to 57° at Dublin on the 14th, and to the same height at Nairn on the 15th. At most other stations the highest readings varied from 50° to 56°. The temperature fell a little below freezing point in "England, S.W.," and "Scotland, E." The rainfall has been very slight everywhere, and in the "Wheat-producing districts" was scarcely appreciable. Bright sunshine districts were decreased in all places, and was very deficient, the percentages ranging from 14 in "Scotland, E.," to 1 in "Scotland, W." Depressions observed:—At the commencement of the period a depression of considerable depth and magnitude was travelling in an east-north-easterly direction off the north coast of Scotland, while the barometer was highest over France. The wind consequently varied from a strong westerly or west-south-westerly gale at our northern stations to a moderate or fresh west-south-westerly breeze in the south. As this disturbance passed away, pressure, with very slight interruptions, continued to increase steadily with moderate or light south-westerly breezes, and on the 16th the mercury had reached the exceptional height of 30.9 inches on our south-east coast, and 30.5 inches to the north of Scotland.

— **GARDENING APPOINTMENTS.**—Mr. H. YOUNG, late Foreman at Rolleston Hall, has been appointed (through Messrs. YERFILL & SONS) Gardener to W. F. GEORGE, Esq., Downside, Stoke Bishop, Bristol.—Mr. RICHARD LYE, late of Brooklands, Dorchester, is now Gardener to W. A. KINGSMILL, Esq., Sydmonton Court, Newbury.—Mr. ALEXANDER LAING, Foreman at The Glen, Inverleithen, has been appointed (through Messrs. DOWNIE & LAIRD, Edinburgh) as Gardener to WILLIAM NELSON, Esq., Salisbury Green, Edinburgh.

EVERGREEN HEDGES.

HEDGES in parks and ornamental grounds generally are usually composed wholly or in part of subjects that partake of an evergreen character. Where only required for purposes of division a good deciduous fence effectually answers, but where shelter has also to be considered, that screen which preserves its efficiency undiminished throughout that portion of the year when the cold blasts sweep over vegetation with most disastrous effect, is certainly preferable. The appearance also of evergreens in hedges during the dull months of the year is no slight recommendation, for however much we may admire the beauty of form and variety of tint and colour presented by the trunks and branches of leafless trees, little can be seen of that beauty in trimmed and bare hedges.

Disappointment and failure have followed the use of many evergreens that have been highly recommended from time to time, but which have proved either unsuitable in habit, or insufficiently hardy for the purpose. Holly would still be one of the best of fence-forming materials could it be induced to grow a little faster—its slowness of growth being the only, yet weighty, objection to its employment in any but the very coldest districts of the United Kingdom. Laurels are more suitable for an irregular screen than for a trimmed fence, but are occasionally used with good effect. Neat fences may be formed of the evergreen Privet (*Ligustrum ovalifolium*), which will quickly give the required shelter. Bat of all classes of plants adapted for making hedges that will afford good shelter and quick growth, combined with pleasing appearance, there are none more suitable than Conifers. Many sorts have, however, been used that have not stood the severe test as to hardness to which they have been subjected by the unusual severity of the late winters; whilst others that have endured the cold with impunity yet proved themselves to be ill adapted for fences by their habit of growth. The base of hedges formed of such *Thuias* as *occidentalis* and *tatarica* has a tendency to become bare from the lowest branches ceasing to extend, and the former has not stood severe cold as well as was expected.

Two long hedges here, planted with American *Arbor-vitæ*, were rendered so unsightly by deaths and injuries occasioned by the winters that it became necessary to remove them. I know of no tree more suitable for ornamental fences than *Thuia Lobbi* (*gigantea*). It is of very quick growth, and is extremely hardy. Many of the hedges here are composed of it, and it did not even the slightest evidences of the effects of frost even on the tip of a single shoot, which is more than can be said of the *Yew*—the oldest and perhaps yet the best tree in some respects for the purpose—which certainly suffered a little from frost-bite.

As this is a time when much of the planting necessary to supply the place of injured hedges will be done, a word in favour of a trial of *Thuia Lobbi*, and for the extended planting of the common *Yew*, may not be out of place. The former is of a brighter and more shining green than is common in Conifers, and contrasts favourably with the sombre effect of the *Yew*, while both are admirably suited for making durable fences that will stand trimming well, and for withstanding injury from frost or breakage of branches from snow, which will find no place for lodgment amidst the close growths of either, when they are kept regularly clipped.

In order to secure a satisfactory fence it is necessary to select good, young, and freely grown plants. The use of large plants is not in itself objectionable, provided they are not stunted—owing their size to age rather than to vigour of growth. The ground where the fence is to be formed should be deeply trenched before planting, working in a considerable quantity of well rotted manure. And where planting requires to be done on ground that has been previously occupied by a hedge or shrubs, it will greatly assist the plants and hasten their usefulness as a screen if some fresh soil could also be added to the site. It is unreasonable to expect free and vigorous growth in hedges that are planted on exhausted soil in positions where there is little chance of give them any after-assistance.

There are at the present time, doubtless, many evergreen fences that have not been killed by the severity of the late winters, but are much injured, and which have made little progress towards restored health during the summer, but to which it is yet thought advisable to give another chance before finally uprooting. In such a case planting may be deferred until the likeli-

hood of their recovery may be determined when growth commences in the spring; as from the middle of April to the end of May is as favourable a time for planting most evergreens as the present season. At the same time it may be well to point out that one disadvantage of late planting is the likelihood of the due preparation of the site being neglected at so busy a season, and also that the labour entailed in watering during June and July, should those months prove to be dry, must likewise enter into any considerations bearing on the fittest time for planting. *Ralph Crossling.*

PRIMULAS AT FOREST HILL.

In few establishments in this kingdom can be seen growing expressly for the production of seed such a large collection of Chinese *Primulas* as are now developing bloom daily in Messrs. Jas. Carter & Co.'s nursery at Forest Hill. It is not by dozens, or by scores, or even by hundreds that the plants are to be counted, but literally in thousands, so large is the number in the various houses devoted to their culture. One great advantage arising from seed growing under these conditions is that the entire stocks are produced under the immediate superintendence of the principals, who ruthlessly relegate to the rubbish heap all plants that do not produce high-class flowers. Growing also specially for seed the Messrs. Jas. Carter & Co. do not encourage high culture in their plants. They rather aim at getting them to bloom after the turn of days, and in restraining rather than encouraging coarse growth, such as the growers of market plants delight to secure. Of the thousands of plants now in bloom or coming into bloom at Forest Hill, nearly all are in 4's, and are remarkably clean, healthy and stocky. They are all that can be desired in a batch of Chinese *Primulas*, but are not fed in any way as the soil in which they are grown is rather poor than otherwise. The great benefit resulting from this style of culture is that the plants produce seed much more freely, in fact, the pollen is more abundant and more fertile than it is on plants which have been fed to produce luxuriant foliage and giant flowers. Whilst the houses are apparently low enough to suit the plants, the manager has sought to help the production of dwarf, robust growth by lifting each plant up to the light, and standing it upon an inverted flower-pot. That the plants are by this arrangement far more exposed to light and air is evident, and equally it is evident that they like it.

One of the most interesting features of this huge collection of *Primulas* is yet undeveloped. In one house there are arranged by dozens sample plants of some sixty diverse kinds, or from diverse stocks or growers. This is an annual test, and not a kind noted for any special quality or novelty of character is left out. It will, however, be a few weeks ere this interesting collection is in full flower, and when it is we may be sure that it will be worth seeing.

The great feature just now in connection with this beautiful winter flower, however, is the new blue *Primula*, now known as *Holborn Gem*, and of which we saw a few days since some 500 plants in flower, and many more coming into bloom, not one of which but is of high quality—large, flat, well fringed, and throughout as true to colour as is the most common kind we have. Here and there plants carry blooms showing even deeper hues, and these will doubtless be selected to produce the seed stocks for another year. The blooming habit of the strain is excellent. The trusses are well thrown up above the foliage, and the flowers look the spectator straight in the face. The history of this blue *Primula* is a simple one. A plant, bearing inferior flowers of a lavender tint, came into bloom from amongst a batch of seedlings. It was selected, and its pollen used to fertilise the flowers of a dark red kind of good quality. From this cross sprang the present blue strain of *Holborn Gem*, a slaty blue flower upon the old red habit and quality, and a fine rosy-pink kind that has been well named *Rosy Morn*, for it is most charming and bright flowered, the blooms large, bold, and abundantly produced. One feature of this rosy kind is the tendency of some of the flowers to assume distinctive bizarre tints, the flakes of deeper rose upon the pink ground being very clear and pleasing. There is no reason why with careful selection there may not be in time evoked from out this kind some really permanent flaked forms.

It is worthy of remark that the blue *Holborn Gem*

is in no way the product of the lilac-tinted kind that has long been grown here. This latter form is associated with the white kind, as it has the same habit and hue of foliage, the leaves and stalks being of a pale green colour. Messrs. Carter's new *Blue King*, on the other hand, has very dark leaves and stalks, so that it promises for that reason to deepen its hue rather than to lose it. These dark leaved kinds also exhibit the strongest constitution. Several hundreds of plants soon to bloom are the product of crosses of pollen of *Holborn Gem* upon flowers of rich coloured kinds. It need hardly be said that their development is being looked forward to with much interest.

A TRIAL OF MIGNONNETTES.

REPUTED varieties of the *Mignonette* are constantly appearing, but the difference they show is generally of a slight character. It will be readily understood that there must of necessity be some difference of character among the many thousands of plants of *Mignonette* annually raised, and where what appears to be a new departure from the normal type appears and possesses good characteristics it is not to be wondered at if some one seizes upon it, takes seed from it, grows it, and when a sufficient stock is obtained, announces it as a new variety. In a year or two the rigid selection applied in the first instance is withheld, and then the produce is apt, and invariably does, revert to the old type. At its best it could scarcely be termed a distinct variety, but it was a good selection, and a good selection is often better than a new variety. In a wholesale seed list we have just counted twelve reputed varieties of the *Mignonette*, but can they be very distinct one from the other?

Last summer Mr. Bause sowed a collection of eight assumed varieties at the General Horticultural Company's *Mellourne Nursery* at *Anerley*, which comprised the *Large-flowering*; *Miles' new Spiral*, a very fine white variety; the *Victoria*; *Garaway's White*, like *Miles' Spiral*; *Odorata ameliorata*, with yellow flowers; *Compacta nana*, *Parson's Giant White*, and *Odorata gigantea pyramidalis*. The most useful for pot culture is called *Compacta nana*, because of its dwarf habit, its fine close spikes of flower, and their rich perfume. To say that one strain of *Mignonette* is freer of bloom than another is assuming too much, for all *Mignonettes* are very free in producing flower-spikes, and it is the natural tendency of the plant to produce these all the season, especially when the spikes are freely cut from the plants. The dwarf compact *Mignonette* grows about 6 inches in height, the flowers of a reddish hue. The *Odorata gigantea pyramidalis* has large spikes of white flowers, is very good, and richly perfumed. A good type of what is known as *Parson's Giant White* is one of the best *Mignonettes* that can be grown. It is a selection from the *Large-flowering*, and where kept true is all that can be desired for pot and border purposes. Perhaps the durability of the *Mignonette* as a plant to cut from is not so well appreciated as it deserves to be.

A sowing should be made on a warm sunny border, which has been well manured, about the end of March, the seed being scattered as thinly as possible on the soil. When the plants appear, and are large enough, they should be thinned out to 1 foot apart, and as soon as spikes of flower show themselves, and are large enough for the purpose, they can be cut.

Then will follow a succession, lasting till Christmas if the bed be kept well watered in dry weather, and a little weak manure-water be added once a week. Those who grow the *Mignonette* in pots sow the seed in 5-inch pots, at the end of August or early in September—some make a point of sowing on September 1—some eight or nine seeds being placed in a pot, and the pots placed in a cold frame close to the glass, but shaded from the sun. Here they remain all the winter, and the plants are kept covered up in severe weather. By April and May fine heads of bloom can be obtained. *R. P.*

ROSE LA FRANCE.—Few of the hybrid perpetual *Roses* are so strongly scented as *La France* when forced early in the season. The abnormal state of things generally which has been brought about by the mild weather is playing mischief with gardeners. I have recently seen a batch of hybrid perpetuals which usually come in about March with several expanded blooms, conspicuous among them being the subject of these remarks. *W. Hinds.*

BOUVARDIAS AS EXHIBITION PLANTS.

MR. BLOMILY, gardener to W. Crosfield, Esq., Oaklands, Aigburth, Liverpool, a successful exhibitor of stove and greenhouse plants at the Liverpool and other local exhibitions for many years, has kindly furnished us with a photograph of a plant which forcibly illustrates what charming specimens these Bouvardias make either for exhibition purposes or for home decoration. The colours of the flowers, it need hardly be said, are very telling in a collection of stove and greenhouse plants in the month of November, and have enabled Mr. Blomily to carry off the leading prize for plants upon more than one occasion at the winter exhibitions of the now defunct Liverpool Horticultural Society.

The plant of which the illustration (fig. 15) is given is a very credible example of the variety *Vreelandii*, and was exhibited by Mr. Blomily at the great show of the Liverpool Horticultural Association held in Sefton Park, Liverpool, on August 2 and 4, 1879. "The specimen was over 3 feet in diameter, and the same plant," writes Mr. Blomily, "continued to flower through the greater part of the winter in the coolest and lightest position in the plant-stove. Briefly summarised, Mr. Blomily's system of cultivation after eight years' experience in growing specimens is as follows:—Cuttings about 3 inches in length taken from the points of the young shoots are inserted in a sharp compost as soon as they can be obtained in February or early in March, and plunged in a brisk bottom-heat, where they soon take root, and are gradually exposed to more light and air. It is important that the cuttings be potted off immediately they are properly rooted, in order that the young plants may not sustain a check to growth through want of sufficient root-nourishment, which at this early stage would induce a firmness of growth which would militate against their rapid development into specimens. After potting the plants are returned to a gentle bottom-heat, and as soon as they have fairly recovered from the shock and commence to grow freely they are pinched, which operation is repeated at intervals throughout the season. It is particularly recommended that the pinching of plants that are intended to be grown into specimens be not neglected in a young state, or the foundation of a handsome specimen cannot afterwards be laid out of straggling irregular-jointed growth.

In a genial growing temperature plants progress rapidly, and repotting will require attention when the roots are found to be numerous at the sides of the pots. It is, however, by no means desirable to repot until the roots have taken possession of the whole ball of earth without being what is commonly termed matted. Ample drainage is given of broken potsherds from 1½ inch in depth to a 6-inch pot to 2 inches in a 10 or 12-inch pot. A thin layer of sphagnum moss is laid over the drainage, and upon this the rougher portion of the compost, which consists of three parts rich fibrous loam and one of leaf-mould and old cow manure, with a dash of sand to keep the whole open. After repotting the plants require careful watering for a time, indeed Mr. Blomily ascribes his success in a great measure to strict attention to watering throughout the whole season's growth. When a plant is watered the soil in the pot is thoroughly soaked down to the drainage, and the plant is not again watered until it is a shade upon the dry side. About the middle of the month of June the plants are turned out into a cold pit or frame with a south aspect, which is kept close for a few days, after which ventilation is increased as the weather gets warmer. The plants are syringed overhead every afternoon in bright weather. During August and September the plants may be turned out-of-doors, but if there is accommodation they are better kept in pits and frames, where they can be protected from heavy rains, which saturate the soil and are injurious to the roots. Old plants with plenty of matured wood in them Mr. Blomily finds flower more freely than young ones, and any one growing from one to two dozens of plants in 6 or 8 inch pots, and giving them a light position in the plant-stove, need not be without a supply of these charming flowers from October to March.

Mr. Blomily treats old plants like *Fuchsias*—they are cut close back, started in an early vinery, partially shaken out and repotted, and treated as already described. The varieties Mr. Blomily recommends are *elegans*, *Hogarth*, *Queen of the Roses*, *Vreelandii*, *Bridal Wreath*, and *Maiden's Blush*. *W. Hind.*

HOME CORRESPONDENCE.

The Culture of *Tecophilea cyanoceros*.—I give with pleasure the information asked for at p. 44, as to culture of *Tecophilea cyanoceros*. I found the bulbs to the kindness of my friend M. Max Leichlin, and his directions were, "Keep cool and airy; a little frost will do no harm, but the greenhouse is too close and warm." Acting on these I sunk the pot in a bed of ashes in a *Lilium auratum* case in our large unheated orchard-house. I had two bulbs only—one of them has flowered. I have some notions as to a rockery which should enable us to grow what are considered half-hardy bulbs; time will show whether our hopes will be realised. Mr. Dominy once said to me, "A gardener should have two lives"; the longer one gardens the more one feels the force of this. *George F. Wilson, Heatherbank, Weybridge.*

Imantophyllum miniatum.—I am glad to see that attention has been called to this plant, as unquestionably it is one of the finest things out, for besides having handsome and very healthy-looking foliage, it bears magnificent heads of large Lily-like flowers, that last a long time in perfection. In shape the blooms bear a close resemblance to those of the well known *Agapanthus umbellatus*, and they are borne on stout stems much in the same way; and as they are as large as those of the *Valloia purpurea*, and of a bright orange-scarlet colour, some idea may be formed of the effect they produce. For large windows in houses I know of nothing in the plant way so valuable, as the leaves, being very thick and fleshy, and having a smooth shining surface, stand the dry atmosphere of a room well and are proof against the injurious effects of the fine particles of dust almost always floating about. Another reason why it does so satisfactorily in a dwelling is that it will stand almost any amount of watering, as, like the *Agapanthus* and *Arum*, it is half aquatic in its nature, and such plants as a rule are the best for amateurs to cultivate, as they do not take much room. When grown in pans that receive the drainage, the continuous wet from which rots the roots of the most of them. Although *Imantophyllum miniatum* is generally regarded as a greenhouse plant, it does very much better in a little more warmth, thriving best when grown in an intermediate temperature, in which it not only flowers more freely, but the blossoms come of a brighter and richer colour. Plants of it also force well, and may be had in bloom almost at any time during the winter by subjecting them to the heat of a stove. The *Imantophyllum miniatum* is a very rosy subject, and likes plenty of pot-room, and a free, rich, open, porous soil to feed on. That which suits it best is fresh rough fibry loam and leaf-mould, with a little old rotten cow-mannure, in which mixture, if potted loosely, the plants grow and spread at a great rate. The only way to propagate is by division, which may be most readily effected by shaking the plants out, as then the suckers can be pulled off, or the crowns split up with safety. To get the plants so obtained to root freely, they should be potted, and plunged in gentle bottom-heat, which will soon cause them to root afresh, and give them a good start. *J. Sheppard.*

Strawberries for Market.—Your correspondent, "Market Gardener," who inquires at p. 59 for the names of two or three of the earliest and best varieties of Strawberries to be grown for market on a gravelly soil have given some inkling as to the locality he hails from; but, assuming that he lives in England, somewhere there is no difficulty in recommending him three varieties that cannot be approached by any others in cultivation for the purpose he mentions. They are as follows:—*Vicomtesse d'Hericart* of Thury, President, and *Sir Charles Napier*. They come into bearing in the order in which their names are given. If your correspondent hails from the North of England he will probably find the former variety sold under the names of *Garryhall* or *Duc de Malakoff*, but it has been so much written about of late years that its synonyms are pretty well known. *Sir Charles Napier* can hardly be called an early variety, but it is indispensable for marketing purposes. It is positively unapproachable by any other variety for marketing purposes in nine cases out of ten, and comes into bearing immediately after *President*. *W. Hind.*

Ice Storing in Sawdust.—I can corroborate all that Mr. Melville has said as to the great value of sawdust in the storing of ice. Mr. Melville says he is not aware that sawdust has ever been used for preserving ice out-of-doors, but I have known it to have been used in several places for at least twenty years with great success. I shall only mention one place where the experiment was regarded as highly satisfactory—viz., *Hallyburton House*, the seat of the late Right Hon. Lord Hallyburton, where a large supply of ice was always on demand, but never could be kept longer than October in the ice-house, although

the house was in all respects a good one, I went there as foreman in the year 1863, and in that year the sawdust was tried, but previous to that, for some years, they were in the habit of building stacks, using turves and straw to cover them; but that expensive way was ultimately abandoned. In January, 1864, three stacks were built, two round and one square, or rather oblong, the latter being put up as an experiment to see how long ice would keep stored out-of-doors in sawdust. It contained about sixty loads as near as I can remember. After it was built several pits of water were thrown over it and left for two or three days in the frost uncovered, when it got like a solid block; it was then properly thatched with Wheat straw and covered with sawdust to the depth of 20 inches, and, with the exception of filling up all cracks in the sawdust, was not touched for two summers, and in the winter following several loads of ice were taken out. It may be as well to note that not so much expense as they do at Dunrobin in making pits, as I built them entirely on the surface, and I believe they have done so year after year ever since with the same amount of success. I consider that stacks built on the surface with ample drainage, (which should never be overlooked, as drainage is one of the great secrets in keeping ice), and the sawdust properly looked after, will be quite as satisfactory as the more expensive system of digging out deep pits. *J. Inglis, Howick Gardens, Leith, Northumberland.*

Wall Copings.—The concluding paragraph in Mr. Fawke's practical letter at p. 59, sums up in a few words the difficulty that must have presented itself to most gardeners at some time or other when considering the subject of wall copings, and the gradual change by additional appliances from simple protectors to the similitude of indifferent fruit-houses. It is likely that so long as our climate remains what it is, some years yielding good results from the open wall, although others sadly perplex the cultivator, there will always be a portion of the more tender stone fruits grown upon walls that are only protected by copings in gardens which are favourably situated either in latitude, soil, shelter, or other local circumstance; while that supply will be somewhat extended by the supplies of the fruit-houses proper. That open walls were productive of regular crops of Peaches and Nectarines when glass structures were neither so cheap nor so plentiful as now, and when more attention was devoted to them because of their then comparatively greater importance, is an undoubted fact which it is becoming the fashion to ignore. I have been acquainted with gardens both in the North of England and in Scotland, where heavy crops of Peaches were the rule and deficient ones the exception. The seasons have recently been adverse, but I venture to suggest that the all-engrossing attention required by the houses in large forcing establishments, and the growing disinclination of journeyman gardeners for the work of a supposedly lower branch of the profession, have had a greater share in the poor results and consequent condemnation of open walls for the more tender cultivation of fruit-covers of any other cause. It is no uncommon circumstance to see the cultivation of Peaches given up, and their places filled by Pears or other fruits, on walls that were noted for nearly half a century for cultural attention and splendid results. Is it that we of the present generation are less persevering? or, which is more likely, are the duties in gardens now of too multitudinous a character to admit of as much time and such close attention being devoted to open walls as in former times?—of which, however, they are as worthy as ever. Good results were and are obtained by permanent projecting copings of an opaque character, and by the use of nets, branches, or other make-shift appliances during the blooming season. That a stone coping which projects more than a few inches from the wall is in some respects open to objection I freely admit, but that it "should certainly not project more" is a hard and fair rule that is upset by copings of good results and of such good effect, which certainly has virtues as well as faults. I am limited that a stone coping is absolutely essential, it is not a matter of great additional outlay to have it a trifle wider; and the extent of wall from which the sun's rays will be obstructed by an extra six inches of projection will be small except in the hottest months of summer, when such a shade is not likely to be a disadvantage on a wall with a southern aspect; whilst in the autumn the direction of the sun's rays are such as to be scarcely intercepted at all in exercising their beneficial and maturing influence on even the highest shoots. The question of the helpful results of rain and dew that are lost by the use of a heavy permanent coping is less easily disposed of, yet where the water supply is good it can be as freely applied as the exigency of the case requires, or the discretion of the cultivator deems necessary; and the drenchings of rain by day and condensed moisture by night—which combine during continued dripping weather occurring at the season of ripening to the production of decay and the

destruction of quantities of fruit—will be in a good measure warded off. In reality it is with many not a question of house or house-like protection, but simply such a coping as will best protect the wall—and consequently the trees—from wet and hoar-frost, and at the same time afford facilities for attaching additional protection speedily on emergencies. And that one means of accomplishing this is by projecting stone coping I have proved from practical experience in several districts, and by observation of results in others. R. C.

Glass Wall Protectors.—I must disclaim the merit of the invention of these structures; the design was given to me by M. van Lierde, a Belgian horti-

Kerner in his work on alpine plants classes it as belonging indifferently to either. Nevertheless in Switzerland we usually find the plant on limestone soil, and in our experimental cultivation we have found lime particularly suitable for it; without it the peculiar white velvety appearance of the involucre is not produced. *Henry Correvon.*

Orange Blossoms.—I send for your inspection two or three sprays of *Citrus Aurantium*, cut from a tree 5 feet high and 4 feet in diameter of the branches, which is covered with bloom from top to bottom. The tree was removed in March from the conservatory, and reotted in a compost of two parts of fibry loam, one of peat, and the remainder nightsoil taken from a

gardener (Mr. Milne) both tasteful and careful management. At the time of my visit (the beginning of December), about the most gloomy period of the year, the houses were most attractive with *Chrysanthemums*, zonal *Pelargoniums* (of which *Ambassador* and *Indian Chief* formed striking features), *Mignonette* exceedingly well done, and the same remark applies to *Chinese Primulas*. A span-roofed stove formed as a whole one of the most charming pictures I ever saw, and yet the material used was exceedingly simple, consisting of *Panicum variegatum* and *Selaginella Krausianum*, as an edging and groundwork. *Calanthe Veitchii*, *Adiantum cuneatum*, *Begonias manicata* and *nitida*, tastefully arranged, all combined to awaken the

FIG. 15.—A SPECIMEN HOUWARDIA. (SEE P. 88.)

culturist. My share in the matter consisted of having contributed an idea, which he afterwards improved upon. *T. Francis Rivers.*

Apricots in Bloom.—I send you some blooms from Apricot trees on the open wall. Some of the fruits are set, and the foliage is fast expanding, showing the unprecedented mildness of the winter. We had a few blooms of Apricots out at Christmas. Broccoli we have been cutting without cessation. The minimum temperature here on December 23 was 27°, with eighteen wet days in December, registering 4.38 inches. *J. C. Mundell, Moore Park, Rickmansworth.*

Alpine Plants; Soil for the Edelweiss.—I perceive that one of your correspondents took exception some time since to my statement that the Edelweiss is specially a limestone plant, and asserts that he finds it more frequently on granite than on calcareous soil. This may be so in Tyrol, indeed, I find that

Vine-border that had been top-dressed with the same twelve months previously. It was then put into an early vinery, and after making its growth was placed in a cool vinery, and from thence taken out-of-doors to a position under a north wall, and kept moderately dry, to thoroughly ripen the shoots. In the third week of October it was again placed in a cool-house until it fairly showed its bloom-buds, when I removed it into a stove temperature of about 60°. *Alfred Bishop, The Gardens, Elm Grove, Saffron Walden.*

Vale Royal, the Cheshire Seat of Lord Delamere.—Few gardens with which I am acquainted are better kept than this. The fruit and kitchen gardens are most productive, while the floral department, consisting of a well-kept flower garden immediately in front of the mansion, and several span-roofed plant-houses well stocked with a judicious selection of free-flowering plants, which are constantly a blaze of floral beauty and sweetness, indicates on the part of the

admiration of the beholder in equal degree to the most choice display of valuable Orchids. What is the inference? Just this—that in order to produce the most pleasing effects it is not absolutely necessary to use the most expensive plants. It is quite refreshing in these days to come in contact with some of the good old-fashioned things which have been in too many instances discarded for novelties. Look at the enormous quantity of new kinds of Crotons and Dracaenas which have been brought into cultivation during the last few years; and yet I venture to say that, take them all round, the three old Crotons—viz., *angustifolius*, *pictus*, and *variegatus*—are equal in every respect to any three of the newer kinds, and the same remark will apply to Dracaenas—*D. terminalis* and *D. Cooperi* have not yet been beaten; therefore, it seems desirable to stick to the good old things, and not cast them away until you are quite sure that you have better ones to take their places. This seems to be the rule adopted at Vale Royal, and

hence it is that you meet with a quantity of the good old-fashioned things which makes it a most interesting place to visit. *Tipton*.

Carriage of Goods by Rail.—A few days ago I received from London a small sack of Peas, Beans, and other seeds by L. & N.W. Ry., with a charge of 5s. 6d. for carriage, the weight of the parcel being 11 lb. more than 1 cwt. I refused to pay, and have since got the demand reduced to 3s. 6d., with an explanation that it was "a mistake." As I still regard the 3s. 6d. as "a mistake," I have refused to pay that until I get further explanation. I am a country seedsman in the Midlands, and had I not some knowledge of railway rates I should have paid the 5s. 6d. as a legitimate charge. When packages, however, go to private persons, many an overcharge is paid for want of knowing what the proper rate should be, and I ask you to give a word of caution to senders to be careful how they consign goods, so as to have them brought by rail at a proper rate, instead of a much higher one, and in fact it would be a great help if consignors would send with invoice or advice note an intimation of the rate of carriage each consignee should pay. This information ought to be placed before us by the railway companies, but is not done, but the information can be obtained by the wholesale houses. *A Warwickshire Seedsman*.

Hoya imperialis.—This old stove climber may now be seen bearing fine umbels of its singular and quaint flowers, in company with the *Spiraea Horsfallii*, in the plant-houses of Messrs. Cripps, Tunbridge Wells Nurseries, which contain one of the most interesting collections of plants in the county of Kent. *Hortus*.

Helleborus fœtidus.—After trying with indifferent success many varieties of aspect, situation, elevation, depression and composition of soil, I have come to the conclusion that Hellebore, and especially Christmas Roses, require atmospheric conditions which cannot be supplied out-of-doors in a cold clay district. There is, however, one Hellebore which thrives very well here, and is ornamental in winter—I mean *Helleborus fœtidus*, the only evergreen native Hellebore. Fifty years ago it was abundant on the limestone rocks on both sides of the Derwent, between Cromford Bridge and Matlock Bath, but it is now hardly to be found there except in the private grounds of Wiltshire Castle, where it still grows wild plentifully. It likes pockets of lead-mould amongst the shady parts of the rocks, but in cultivation it is not particular about soil or situation. It sometimes in its third or fourth year from seed forms a bush a yard high, and as much across; at this age it is liable to be broken by wind or by its own weight, and is not reproduced from the root, though cuttings of it will strike. In most seasons it ripens seed plentifully, which is shed in June, and germinates on rocky light soils the following spring. The seed is stored dry till spring it sallows down. The juice of the plant contains a strong acrid poison. I collected some seed last summer, and with opening the pods my thumbs and forefingers were made as sore as if they had been scalded. The large deeply cut dark green leaves and the light green flower buds, which are produced in large bunches, and last all through the winter months, make it a handsome plant for a rough stone bank, or a dry shrubby walk. *C. Witley Dow, Edise Hall, Malpas, Jan. 16*.

Plants in Flower at Colwyn Bay.—I send you a list of plants in flower to-day in my garden at Nant-y-Glyn, Colwyn Bay, without any protection. I would particularly call attention to that abominably named Tea Rose, *Isabella Sprunt*, which has been for the last two or three months, and still is, producing numerous blooms almost, if not quite as good as if it were early autumn:—*Arabis albidus*, *Iberis sempervirens*, *Wallflowers*, *Stocks*, *Viola* (Czar), *Hills*, *Tea Roses*, *Corydalis caryophylla*, *Othonna chertifolia*, *Chrysanthemum indicum*, *Schizostylis coccinea*, *Snowdrops*, *Fuchsia macrophylla*, *Veronica ligustifolia*, *Berberis Aquifolia*, *B. Darwini*, *B. nepalensis*, *Escallonia sp.*, *Lonicera fragrantissima*, *Pittosporum Tobira*, *Ceanothus punicicus*, *Rhododendron arboreum*, *Arbutus Unedo*, *Laurustinus*. *Alfred O. Walker, Chester, Jan. 16*.

Plants for Covering Walls.—A very knowing writer, a gardening correspondent of the *Field*, who lately undertook to grow more alpine in a common ploughed field than gardeners could grow on all their rockeries, recommends in last week's issue amongst useful climbing or creeping plants for covering unsightly walls, out-houses, &c., Tea plants, specifying *Thea bohea* and *Thea viridis*, which he has seen used for such purposes with very good effect. I quote the sentence:—"The Tea plants, *Thea bohea* and *T. viridis*, are rapid-growing plants, of elegant appearance, and will grow anywhere. I have seen them used to good purpose in hiding unsightly spots in back-

yard gardening." One might suspect that he means *Lycium barbarum*, commonly called the Tea-plant, but he writes with such confidence, and is apparently so well up, that I write to ask whether the Tea plants proper are usually hardy in England, and whether in any country they could be used as wall climbers? *C. W. P.*

Lycopodium Forsteri.—This beautiful Fern has been spoken of as a newly introduced species. Nearly twenty years ago, when serving in the gardens of the late Mr. Hadwen, at Edge Hill, Liverpool, we frequently exhibited this *Lycopodium* in collections of Ferns at the exhibitions then held in the Botanic Gardens. It is a charming plant when nicely trained, and nearly equal to a *Cleicheia* in merit when exhibited in a collection of Ferns. It thrives well in an intermediate fernery, and puts on a beautiful colour when grown in rather deep shade. No lover of Ferns should be without this plant, as it is the gem of the climbing kinds. *J. Roberts, Gunnersbury*.

The Snowdrops (*Galanthus nivalis*).—Whether flowering in the cottage or palace garden, or in the wayside hedges, it matters not, the thoughts and the impressions which they convey are the same, and in the words of Miss Howell they are—

"White as driven snow,
And as snowflake pure;
Drooping heads they show,
Of our welcome sure."

A blessing on the early flowers
Which take us back to childish hours!"

Since the beginning of the new year the Snowdrops—principally of the single variety—have been and are still flowering very profusely in many of the village gardens and orchards in this district, which with the embossed masses of pure white, with a background of rich verdure, and the trees musical with the song of birds, have a very chaste and cheery effect in the middle of January, when contrasted with the surrounding landscape. On either side the winding walks in the shrubberies here, which are edged with flints, is a row of double Snowdrops, which in the aggregate are about 2 miles long. The curvilinear lines of these when in full flower, with the red gravel in the foreground and the ornamental evergreens in rear, together with the murmurings of the rivers Avon and Chalk, which flow through and unite at the bottom of these grounds, and overhead the flutter of pigeons consequent on the sound of approaching footsteps, makes a pretty picture for the time of year. *H. W. Ward, Longford Castle*.

FORESTRY.

HEDGEROW TIMBER.—An important branch of forestry, and one which deserves considerably more attention than has hitherto been bestowed upon it, is that which is generally termed hedgerows. Hedgerows are grown for various purposes, such as shelter and shade to man and the lower animals, ameliorating the climate of the country, yielding useful and valuable wood and timber, and beautifying and embellishing the landscape. These all, except perhaps the first and last, can be attained by other, and in some respects cheaper and better means. To those, however, who are charmed with and see beauty more in lines or chains of trees than in other phases and features of the landscape, and believe that kind of rural adornment surpasses all others, there is no need or reason for applying argument, and therefore, if you can afford it, there is no good reason why they should not have and enjoy their own luxury as others do theirs, and in order to assist them in this commendable and praiseworthy undertaking, the following observations may be found serviceable.

In the first place, when rows of trees are proposed to be planted in lines of fences, divisions of fields, or along roadsides, it must be seen to that the ground is sufficiently dry, for although some species of trees—as the Alder, Willow, and Poplar—flourish for a time in damp or even wet soils, they yet soon lose their root-vitality within and decay. In flat-lying districts hedgerows now, as in the days of the Romans, are planted upon mounds or ridges, laid up for the purpose. Some of the mounds are only about 6 feet wide and 3 feet deep, and others, as should be, are often more than double these dimensions. When the land is of small value the mound may be made 15 feet wide at the base, and rounded, so that the highest and deepest part is in the centre, which may be about 7 feet deep. In such cases, Thorn or Quick-set hedges are planted near the base of the mound on each side and a row of trees in the centre, 30 to 40 feet apart. This kind of hedgerow is very useful as

a game covert, and in such both partridges and pheasants delight to breed and find shelter and protection, and the hedges may either be trimmed or allowed to grow up roughly as taste and other things suggest. Such mounds, which are usually formed of wet or clay soils, become sufficiently dry when so raised above the natural level of the ground, and are well adapted for the growth of several species of forest trees. Clay soils are adapted to Oak, which also makes an excellent hedgerow tree, and some of our finest qualities of timber are grown on strong tenacious clays. Beech also grows well in strong clay soils, especially on mounds, and is also very ornamental in such situations, but if allowed to stand to old age, especially on flat clay ground, it is very liable to become decayed in the heart. The quality of clay-grown Beech, however, like that of the Oak, is very superior, and only requires attention to cutting at the proper age. The common Ash is also an excellent and valuable hedgerow tree, and its timber upon clay soils is of the very finest quality. As an object of beauteous trees surpass the Horse Chestnut, and it grows in almost any soil, if only dry. It, however, though very hardy in these respects, does not stand the wind well, as its branches are very brittle, and its excessive shade is also against it. Clay-grown Ash should, however, be cut before its bark becomes cracked, as after that period it often becomes decayed in the heart, and deteriorates in quality by losing its toughness. The grey or Able Poplar and Willow also grow well on clays, but, like the Beech and Ash, require to be cut before attaining old age, otherwise decay in the heart deteriorates their value, and at best they are but short-lived.

The Silver Fir, as an evergreen tree, often very properly called into service, and supplies an important requirement in the landscape, especially for winter effect. It grows well on clay soils, and often attains large dimensions and considerable age, and still remains quite sound. It is also very hardy, and endures with impunity all kinds of weather except frost, when young, in low situations. As a single grown tree, however, it inclines much to branches, and unless they are judiciously checked and containing leaders relieved the value of the tree as timber is much deteriorated.

A truly beautiful line of trees, surpassing probably all others, is that composed of Horse Chestnut and copper-coloured Beech planted alternately at 40 to 60 feet apart, according as the trees are expected to grow to very large or medium size.

The distances apart at which the trees in all cases should be planted, how they should be pruned, and when they should be cut, are all matters requiring much attention. Having planted hedgerow trees at all distances apart, from 30 feet to 30 yards with equal success, it may safely be left to the taste of those whom it is to please, to plant at such distances as they prefer. If hedgerow planting is done with a view to profit 30 feet apart is sufficient, as thereby each tree spreads its branches 15 feet before coming in contact with the nearest adjoining tree; but, as already said, hedgerow planting is most frequently done entirely with the object of beautifying and enriching the landscape, and when this is attained the end in view is considered well accomplished. Trees in the landscape, where they should stand isolated, and each showing itself in full perfection, should be about 50 yards apart. Great attention should, however, be paid to the work of planting, especially in seeing that the trees are not too deeply planted, which is too often the case, as the results are destructive and ruinous. Nothing tends more to the decay of the roots and central lower part of the trunk and blowing down of the trees than deep planting. Small trees are not so apt to be too deeply planted as large ones are, for it is too often the practice to plant large trees deep in order to firm them in the ground, and avoid the necessity of laying stones over their roots, driving stakes into the ground, and adopting other means of supporting them against blowing down by the wind. *C. J. Michie, Forester, Cullen House, Banff*.

ROYAL BOTANIC SOCIETY.—We learn that the special exhibitions organised by this Society for the coming season will include shows of *Camellias* and *Ilyacynths* from March 8 to 18, by Messrs. William Paul & Son, Waltham Cross; *Hardy Azaleas*, *Rhododendrons*, and *American plants*, in May and June, by Mr. Anthony Waterer, Knapp Hill; and *Roses* in pots and cut blooms from July 18 to 25, by the Cranston Nursery Co., Hereford.

Reports of Societies.

Edinburgh Botanical: Jan. 12.—The Society met in 5, St. Andrew Square, Mr. Alex. Buchan, M.A., Vice-President, in the chair. The following communications were read:—

I. "On the Geology and Botany of the Isle of Man," by the late Professor Edward Forbes, with additions by J. F. Robinson, Frodsham.

II. "On the sudden appearance of Epilobium angustifolium on burnt clay forming the lower part of an embankment of the Great Northern Railway in the parish of Breadsall, Derbyshire," by Mr. Joseph Whitaker. The plant is rare in the neighbourhood; a patch of it was known to Mr. Whitaker in a lane 2 miles distant from the new station, but this is now extinct. He had also picked up a solitary specimen in a lane in 1879, some 6 or 7 miles distant from the railway embankment.

III. "A series of recent researches submitted to the Botanical Society of France regarding variation of intensity of colour in the same species at different altitudes and varied latitudes," by Andrew Taylor, Assistant-Secretary.

Mr. John Sadler, Curator of the Royal Botanic Garden and Arboretum, intimated that he had received from Mr. Elwes, Cirencester, Gloucestershire, a collection of ninety packets of seed, from Tibet, to be raised in the Botanic Garden, and said he expected that many of these would prove to be new species and new varieties. This was the first consignment of any extent of seed that had been sent home from the uplands of Tibet. He had also received a collection of seed from the Botanic Garden at Saharanpur, collected principally between 10,000 to 15,000 feet in the Himalayan Mountains. Referring to the improvement which was being carried out at the garden, he said they had got the walls up of the new house to raise those seeds and to grow cool plants, and in a week or two it would be completed, the cost being about £200. This was an important acquisition to the garden. They had also got a nursery finished which they called a marsh or bog garden. They had always been at a disadvantage in the cultivation of certain plants which required to be grown in boggy or marshy soil, and in this marsh garden they intended to give them a place, and they thought they had a much better chance of flowering properly than in pots. With regard to the Arboretum, he might say they were making progress. They had formed a nursery to receive the donations which were coming in in a few weeks from New, and from many nurserymen. They wanted to make a start with the planting by the end of February or beginning of March, when they hoped to be able to show the public and the Society a nice collection of trees and shrubs. It would take four or five years to make anything like a complete collection, and he hoped they should have the sympathy of all who could assist them in making it a success. In submitting his report on the progress of open-air vegetation at the garden Mr. Sadler said this was the most remarkable season he had ever had anything to do with. He could not get one season to stop that he might begin with another—the thing went on continually. For instance, during November they had in the aggregate only 1 1/2" of frost. In December the thermometer was at or slightly below the freezing-point on sixteen occasions. The greatest frost was on the 22nd, when it fell 27°, and 25° were registered respectively. That was the heaviest frost—in fact, the frost—of the whole month. This was very extraordinary, when they considered the severe frost they had at the same period last year. Since January commenced the thermometer had been at the freezing-point on eight occasions, the lowest temperatures being on the 4th and 5th, when 28° and 29°, or 1° and 3° of frost respectively, were registered. In consequence of the exceptional mildness of the season, vegetation had hardly been retarded. He had, that afternoon, gathered out fifty-two species and varieties of plants in full leaf, and these were now on the table for the inspection of members. The collection included fourteen different species of Hellebores, which he strongly recommended gardeners to propagate. In the course of some further remarks, Mr. Sadler said that he had not been so very serious for them yet. He called their attention especially to sprigs of Mignonette in flower, which he supposed was a thing unheard of in the memory of man—in the vicinity of Edinburgh at all events. He also specially mentioned Crocuses, Fannies, Koses, and many other plants.

VI. Miscellaneous Contributions: 1. Mr. John Campbell, Ledaig, Argyllshire, sent the following flowers in bloom:—Rhododendron Noëlbium, Galbanus nivalis, and Erica heather. 2. Messrs. J. C. Grove, Strirling, and the botanist, in the basket of Orchids presented by Dr. Paterson, Bridge of Allan, to Her Majesty, on her last journey southwards from Balmoral.

Scottish Horticultural Association.—The ordinary monthly meeting of this Association was held in 5, St. Andrew Square, Edinburgh, on Tue. day, January 3, 1882. Mr. John Downie, President, in the chair.

Mr. W. Wilson Macdonald read a paper on the "Food of Plants," the paper on this subject, and of which we shall publish in another issue. Mr. Chas. Buchanan, Penicuik House gardens, exhibited two flowers of Luculia gratissima, cut from a plant which had over thirty flowers upon it. Mr. Robertson Munro, Abercorn Nursery, exhibited a collection of hardy cut

flowers, all taken from the open air. The most noticeable in the collection was a bunch of Gloire de Dijon Roses in splendid condition, the other articles, were Carnations, Hepatica biloba, Veronica rupestris, Wallflower, Jasminum nudiflorum, Primrose, Christmas Rose, Daisies of sorts, Polyanthus, and China Roses. The Lawson Seed & Nursery Co. exhibited a plant of the new double Bourardii, Alfred Neuner, in flower. Messrs. Ireland & Thomson also exhibited a plant of this Bourardii, and a flower-spike of Anthurium Andreanum. It was intimated that Mr. Isaac Anderson-Henry, F.L.S., F.R.S.E., Honorary President, had in preparation a paper, to be read at a future meeting of the Association, on the retardation of vegetation of seeds in various tribes of plants.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 18, 1882.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygrometric Deductions, WIND, RAINFALL. Rows for Jan 11-18.

- Jan 11.—A dull, overcast, foggy day. Fine night.
12.—A fine morning, but overcast day. Fine cloudy night.
13.—A fine day, but dull and overcast. Fine night.
14.—A fine but dull day. Fine night, but damp falling in the evening.
15.—A fine fresh morning; dull, overcast day. Fine night, but misty.
16.—A dull, foggy day, and night damp and cold. This is the first day since December 25th that the temperature has been below its average.
17.—A very dense black fog, day and night cold. Remarkable high reading of the barometer.

LONDON: Atmospheric Pressure.—During the week ending January 14, the reading of the barometer at the level of the sea decreased from 30.25 inches at the beginning of the week to 29.25 inches by midnight on the 8th, increased to 30.36 inches by midnight on the 9th, decreased to 30.16 inches by midnight on the 10th, increased to 30.45 inches by 9 A.M. on the 13th, decreased to 30.41 inches by 3 P.M. on the 13th, and was 30.64 inches by the end of the week.

The mean reading for the week at the level of the sea was 30.35 inches, being 0.56 inch higher than last week, and 0.42 inch higher than the average of the week.

Temperature.—The highest temperature in the shade in the week was 51.5, on the 11th. On the 14th the temperature did not rise above 42°. The mean of the seven high day temperatures was 47.5.

The lowest temperature in the week was 36°, on the 10th, on the 11th the lowest temperature was 45.4°. The mean of the seven lowest temperatures was 39.2°.

The greatest range of temperature in one day was 12.9, on the 8th; the smallest was 3.5, on the 14th. The mean of the seven daily ranges was 8.3.

The mean daily temperatures were, on the 8th, 41.6°; on the 9th, 41.3°; on the 10th, 42.6°; on the 11th, 48.1°; on the 12th, 44.9°; on the 13th, 44.3°; on the 14th, 40.2°.

The mean temperature of the air for the week was 43.6, being 0.1 higher than last week, and 7.3 above the average for the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 87°, on the 13th; the highest, on the 8th and 14th, was 46°. The mean of the seven readings was 60.2.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 35.5, on the 10th. The mean of the seven readings was 35.2.

Rain.—Kain fell on two days, to the amount of 0.54 inch, of which 0.51 inch fell on the 9th.

ENGLAND: Temperature.—During the week end-

ing January 14, the highest temperatures were 56° at Truro, 53.8° at Plymouth, and 52° at Cambridge. The highest temperature at Hull was 48°, at Wolverhampton 48.5°, and at Brighton and Leeds 49.7°. The general mean was 50.9°.

The lowest temperatures in the week were 31.5° at Wolverhampton, 32° at Truro, and 33.8° at Leicester. The lowest temperature at Liverpool was 39.4°, at Leeds 38°, and at Bristol 37.5°. The general mean was 35.3°.

The greatest ranges of temperature in the week were 24° at Truro, 18.8° at Plymouth, and 17.7° at Leicester. The least ranges were 11° at Leeds, 11.5° at Liverpool, and 12.3° at Bradford. The general mean was 15.6°.

The mean of the seven high day temperatures was highest at Truro, 53.4°, at Plymouth 50.9°, and at Sunderland 49.5°, and was lowest at Hull, 45.7°, at Wolverhampton 45.8, and at Bradford 46.4°. The general mean was 48°.

The mean of the seven low night temperatures was highest at Truro, 43.3°, at Plymouth 42.8, and at Liverpool 41.7.4; and was lowest at Wolverhampton, 31.9, at Leicester, 36, and at Nottingham 36.8. The general mean was 39.3°.

The mean daily range was greatest at Sunderland, 11.1; at Wolverhampton 10.9, and at Leicester 10.8, and was smallest at Bradford, 5.6, at Leeds 7.4, and at Bristol 7.8. The general mean was 8.7°.

The mean temperature for the week was highest at Truro, 48.1°, at Plymouth 46.6, and at Bristol 44.6, and was lowest at Wolverhampton, 40.1, at Hull and Leicester 41.2. The general mean was 43.5°.

Rain.—The largest falls were 1.09 inch at Bristol, 0.83 inch at Cambridge, and 0.63 inch at Leicester. The least falls were 0.08 inch at Sunderland, 0.23 inch at Hull, and 0.26 inch at Sheffield. The general mean was 0.44 inch.

SCOTLAND: Temperature.—During the week ending January 14 the highest temperature was 57, at Glasgow; at Dundee the highest temperature was 48°. The general mean was 51.9°.

The lowest temperature in the week was 36.9, at Aberdeen; at Paisley the lowest temperature was 34.7.

The general mean for the 34th week was highest at Paisley, 45.5; and lowest at Aberdeen, 40.7. The general mean was 42.7°.

Rain.—The largest falls were 0.96 inch at Greenock, and 0.89 inch at Glasgow. The least falls were 0.04 inch at Aberdeen, and 0.06 inch at Edinburgh. The general mean was 0.43 inch.

JAMES GLAISHER, F.R.S.

Obituary.

It is but a comparatively short time since Mr. KIPPIS retired from the office of Librarian to the Linnean Society a post he had filled for more than fifty years with such zealous faithfulness that the award on the part of the Council of his full pension was felt by all to be only what was fitting under the circumstances. Mr. Kippist, however, has not long lived to enjoy his well-earned leisure. For some years past he had suffered from chest affection, and to this he succeeded in his seventy-second year, at his residence in Chelsea, on the 14th inst. Mr. Kippist entered the service of the Linnean Society so long ago as 1830, and in 1842 he was appointed Librarian in place of the late Professor Don. Precise and methodical almost to a fault Mr. Kippist completely identified himself with the Society, and it is very questionable whether the President and Council did not, in his opinion, hold a higher place than any other or department of State, no matter how exalted, from his long association with successive generations of Fellows Mr. Kippist was imbued more deeply with the ancient traditions of the Society, and had a fuller recollection of its departed worthies—the Browns, the Stanleys, the Lamberts, the Bennetts, and many others—than any one, save perhaps Mr. Bentham, happily still spared to us. Faithful to his trust and diligent in his work Mr. Kippist, though in this, as in other matters, scrupulously careful as an observer, and with a well-stocked memory, published but little. He had, however, a good knowledge of plants, especially Australian plants, Proteaceæ, &c. His name will be commemorated among botanists by the name Kippistia (a genus of Composite), named in his honour by Baron von Mueller, but those who came in contact with him will need no such reminder of a man who by his devotion to the Society and his fidelity to his duties, and his courtesy and willingness to aid others, earned the goodwill and respect of the Society at large and of naturalists generally.

—We regret to record the death, at Melrose, N.B., on the 14th inst., aged twenty-two years, of Mr. CHARLES WALTER ORMISTON, of the firm of Ormiston & Renwick, seed merchants and nurserymen.

Enquiries.

He that questioneth much shall learn much.—Bacon.

DECAY OF CONES.—I am desirous of ascertaining how long various cones float before becoming waterlogged. I am also trying to ascertain whether all Cedar cones fall piecemeal, and whether Abies cones decay much more rapidly than those of Pines. Can any reader help me? J. S. Gardner.

BOOKS: A Young Beginner. 1. Either Oliver's Elementary Lessons in Botany (Macmillan & Co.), or Botany for Beginners (Bradbury, Agnew, & Co.). 2. Ross' Practical Remains of the Latin Language (Blackwood). Any bookseller could get them for you.

CAPABILITY BROWN: II. A portrait of Lancelot Brown exists in the Pagoda Room at Burghley, according to a writer in Notes and Queries. Brown is said by some to have died in 1773, when at work at Burghley; by others it is asserted that he died in 1783, while acting as head gardener at Hampton Court.

COLOURS OF ROSES: J. Fair. Baron Rothschild, crimson; Catain, bright rose; Heroine Vaucheur, clear rose; La Favorite, rose; Madame Bellenden Ker, white; Madame Charles Bude, pale rose; Madame Lilienthal, bright rose; Rev. H. D'Ombraun, carmine; Senateur Cheveau, bright red. We cannot find the other names in any list in our possession.

CUCUMBERS AND BEANS: A. P. The plants have become so weak check to their growth, but we can find neither fungus nor insect. They are not diseased, but what is the cause of the mischief we cannot say. Has it been done by pouring water on pipes or flue while over-heated?

ERIOSTEMON NERIFOLIUS: A. P. B. By cuttings in glass, inserted in sand, and covered by a bell-glass.

HEDGROW TIMBER: Landed Proprietor. See p. 90.

MYSTACIOUS PLANTS: T. H. T. We presume it must be a misprint for "myrtaceous."

NAMES OF PEARS: W. H. B. Not recognised, being too much decayed.

NAMES OF PLANTS: G. Steel. 1. Erica Melanthera; 2. E. Caffra; 3. E. Boniana; 4. Erica Mrs. Pym. — T. P. The specimens were too much damaged for recognition through the post. You should pack them in green moss in a small tin box.—J. Sauter. The shrub is Photinia serotina; the white seed, Job's Tears (Coxia laetifolia). We do not recognise the other.—H. E. Franka verticillata, var. sinensis.—J. H. The seeds received from the West Indies, and labelled "Yellow Valloa," will probably turn out to be the Pynolirion aureum, syn. Anarjalis aurea. We have never heard of a yellow Valloa. —Hatch & Son. From your description we suppose Arum Draconculis is the plant you allude to.—Constant Reader. Cupressus nutkanensis, better known as Thuopsis borealis.

PERIANTH: T. H. T. This is a general term applied where the distinction between calyx and corolla is not obvious, as where both are similarly coloured, as in the Tulip, Crocus, Iris, &c., or it may be used in cases where the calyx is brightly coloured and the corolla is present, or only in the form of scales, as in Daphne, Grevillea, &c.

SEEDSMEN AND ASSISTANTS: Roberts. No doubt both seedsmen and assistants have sufficiently good reasons for advertising under noms de plume, and it would do no good to publish your letter.

STRAWBERRIES: S. August is, of course, the best month for planting out Strawberry runners, but it is not always convenient to plant then, and the work is deferred until nice open weather sets in, in February or March. If carefully planted in good soil the "prepared runners" will do well, but the weight of the crop the first season will depend upon the strength of the crowns when planted.

SUTHERLAND GARDEN ENGINE: F. Urquhart & Co. We do not know the name of the maker.

TWIN FLOWERS OF EUCHARIS: H. & Co. Not uncommon. It is the result of union at a very early stage from compression.

WANTED A GARDENER: Synophthalma. We cannot interfere. Every one has a right to do as he pleases in such matters.

* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editor," and not to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

CATALOGUES RECEIVED.

Markets.

COVENT GARDEN, January 19.

Our market remains the same as last week, with a continued demand for good Apples. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant names and prices. Includes Aralia Sieboldii, Arabis var. (golden), Begonias, Bouvardia, Cyclamen, Dracena terminalis, Euphorbia, Eucyamus, Evergreen, Ferns, Ficus, Foliage Plants, Hyacinths, Lily of the Valley, Myrtles, Palms, Pelargoniums, Primula, Scabiosa, Tulips.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower names and prices. Includes Abutilon, Azalea, Bouvardia, Carnations, Cyclamen, Euphyllium, Gardenias, Hyacinths, Primula, Tropaeolum, Violets, Lily of Val.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns for vegetable names and prices. Includes Artichokes, Lettuce, French Beans, Onions, Peas, Potatoes, Radishes, Rhubarb, Spinach, Tomatoes, Kent Regents, Champignons, Magnum Bonitas.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit names and prices. Includes Apples, Grapes, Kent Cobs, Lemons, Peas, Pine-apples.

SEEDS.

LONDON: Jan. 18.—Owing to the weather being so dark and foggy the market to-day opened with extreme quietness. All kinds of Clover seed, however, keep firm in value. For both American and Canadian red rather more money is asked. As regards Italian Rye-grass choice samples have now got into very narrow compass. In spring Tares the tendency is still upwards. Hemp seed being scarce for the time is dear. The trade for Canary seed is slow. John Shaw & Son, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday prices ruled fully 6d. lower for Indian Wheats. The white descriptions of foreign were also generally rather easier where sold. Other sorts were about as before, but with very little doing. Flour was in limited demand, at about previous rates. The official top price of town flour has been reduced 3s. 6d. to 47s. per cwt. Fine quality Barley upheld late value, but grinding sorts were barely supported. Common Russian Oats were 3d. to 6d. lower, with a dull sale, but good qualities were steady. Beans and Peas were steady, and Maize, with large supplies, was 3d. to 6d. easier on the week.—On Wednesday, so far as English Wheat is concerned, there was no disposition to accept lower bids on the spot. Foreign Wheats on the spot were dull and nominally unaltered. Barley was unaltered on the spot, but weaker forward. Maize on the spot was quieter, off-ast firm, and forward weaker. There was rather a steadier tone in the Oat trade, though business was restricted.—Average prices of corn for the week ending January 14:—Wheat, 45s. 5d.; Barley, 32s. 6d.; Oats, 20s. 3d. For the corresponding period last year:—Wheat, 42s. 1d.; Barley, 32s. 1d.; Oats, 19s. 3d.

CATTLE.

At the Metropolitan Market on Monday trade in beasts was slow, but little change occurred in prices. Sheep were in short supply; choice qualities sold well and the general trade was steady. Calves brought previous value. Quotations.—Beasts, 4s. to 4s. 8d., and 5s. to 5s. 10d. (in some cases 6s.); calves, 1s. 8d. to 1s. 6d.; sheep, 5s. to 6s., and 6s. 6d. to 7s. 4d.—Thursday's trade was very quiet, and without feature. Supplies were short, but in the absence of demand sufficient, both beasts and sheep being nominally the same as on Monday. Calves were unaltered.

HAY.

Tuesday's Whitechapel Market report states that with large supplies, of hay more especially, trade was dull. Quotations:—Prime Clover, 120s. to 136s.; inferior, 120s. to 95s.; prime meadow hay, 115s. to 126s.; inferior, 55s. to 90s.; and straw, 30s. to 54s. per load.—On Thursday there was a moderate supply of fodder on sale. The trade was dull for Clover and hay, and prices were lower for meadow hay, but for straw stiffer.—Cumberland Market quotations:—Superior meadow hay, 120s. to 130s.; inferior, 84s. to 100s.; superior Clover, 126s. to 136s.; inferior, 90s. to 110s.; and straw, 50s. to 56s. per load.

SPITALFIELDS.

The Borough and Spitalfields Markets reports state that foreign arrivals continue moderate, but English supplies are fully adequate to the demand, which is dull, at the following quotations:—Best Scotch, 75s. to 110s.; Scotch, 60s. to 80s.; Essex, 60s. to 70s.; Roscoff, 100s. per ton; German reeds, 3s. 6d. to 4s. 6d. per bag.—The imports into London last week were as follows:—1600 bags Hamburg, 664 tons Roscoff, 50 casks Dundee, 73 tons Earleury, 91 tons Pampul, and 113 tons Dunkirk.

COALS.

The following are the prices current at market during the week:—Beaside West Hartley, 14s. 3d.; East Wylam, 17s.; Ravensworth West Hartley, 14s. 3d.; Walls End—Hetton, 17s. 6d.; Hetton Lyons, 16s. 3d.; Thorns, 13s. 6d.; Lambton, 16s. 6d.; Oriental Hartlepool, 16s. 6d. and 17s. 6d.; Wear, 15s. 6d.; South Hetton, 17s.; Chilton Tees, 15s. 6d. and 16s. 6d.; Tees, 17s. 3d.; Caradoc, 16s. 6d.; East Hartlepool, 15s. 6d.

Government Stock.—Consols closed on Monday at 100 to 100 1/2 for delivery, and 100 1/2 to 100 1/4 for the account; the same figures were recorded at the close on Tuesday. On Wednesday Consols for delivery closed at 100 1/2 to 100 1/4, and at 100 1/4 to 100 1/2 for the account. Thursday's final quotations show prices to be easier for delivery, and 1/2 lower for the account.

Kent: The Garden of England.

- A slight extra charge must in most cases be made for packing. Where cash in payment of goods is sent *before the order*, the amount for postage may be towards the stamps after despatch of goods. All the above prices are subject to the discounts named at head.

THE GENERAL AUTUMN LIST
will be forwarded *Gratis* and *Post-free* to all applicants.

N.B. Post-office Orders should be made payable to EWING AND CO., at Eaton, near Norwich. Cheques crossed GURNEY AND CO., Norwich.

Trade Terms on application.

ORCHIDS.

The Largest and Best Stock in Europe of good Established Plants. Tens of Thousands of Plants to select from.

MR. WILLIAM BULL
Begs to intimate that his Orchid-houses are always quite a sight, from the large number of plants in flower, and he will be pleased to show them to any one interested in this beautiful class.

MR. WILLIAM BULL
Recommends those desirous of having their Houses gay with Orchid flowers, to purchase good established well-cultivated plants, which bloom well, are far more satisfactory, and comparatively cheaper than newly imported or semi-established plants.

WILLIAMS' UNRIVALLED STRAIN OF PRIMULAS
POST-FREE.

Having for many years devoted special attention to the cultivation of Primulas I have, by careful selection, succeeded in bringing my strains to the highest state of perfection attainable. They never fail to maintain their well-merited reputation, and are invariably securing prizes whenever exhibited—a fact which sufficiently attests the excellence of their quality. Numerous unsolicited testimonials are received from Customers in all parts of the world, in the expressions, in the most eulogistic terms, the satisfaction these strains have given them.
The difference in price of packets applies to quantity only, the quality of all being alike.

THE QUEEN'S SEEDSMEN H.R.H. THE
SEEDSMEN, Special Warrant PRINCE OF WALES
TO
237 High Holborn, London, W.C.
2381

VICTOR POTATO.

CHARLES SHARPE AND CO. regret that their stock of the above valuable Potato is already exhausted. They can still supply

DUKE OF ALBANY,

a heavy cropping early variety. It grows a crop as heavy as the Magnum Bonum, and is 10 weeks earlier. Ripe in August it will keep unto March, and be good for the table any time from July to March. As a main crop Potato it is unequalled.

Price, 6d. per Pound.

CULVERWELL'S GIANT MARROW PEA,

LONGEST PODDED EXHIBITION PEA.

See the *Gardener's Chronicle*, October, 1881. A Correspondent tells how he had 9 ounces of Peas from 24 pods of this variety. In the same paper Mr. J. MUIR says:—"Indeed it is the longest podded Pea with which I am acquainted, and the pods are produced abundantly. They fill quickly and well, and the flavour is all that can be desired."

Price, 2s. 6d. per Packet.

SHARPE'S INVINCIBLE BLUE MARROW PEA,

Price, 2s. 6d. per Quart.

NISBET'S VICTORIA TOMATO.

Seedling from Vick's Criterion. Fruit, smooth, elegantly oval, and produced in immense bunches. Colour, bright red, with a tinge of blue. In size and appearance resembling a Victoria Plum. It is a vigorous grower, requires no stopping, producing a bunch of fruit at every joint, and is well adapted for training up the raters in the manner of a Grape Vine. It is admirably adapted for winter fruiting, and for summer fruiting it is one of the best. From the quantity of handsome fruit it produces and its exquisite flavour, it is certain to become an universal favourite, and

TOMATOS ALL THE YEAR ROUND can easily be secured by cultivating the VICTORIA.

Price, 1s. per Packet.

This, the perfection of frame Cucumbers, is a cross between Telegraph and Tender and True; in form it has a resemblance to Telegraph, but is of a darker green and much longer—fruit 31 inches in length having been cut from it. In flavour it is superior to Tender and True, but its chief recommendation is its marvellous productiveness, in which it excels everything that has come under our notice, as many as 300 and 400 fruit having been cut at one time from 12 plants, in a 3-light pit, 3-quarter span.

For succession it is unequalled, bearing as abundantly at Christmas as Midsummer—and in addition to its handsome form and lovely colour, it is a variety that seldom produces seeds, not one in a hundred containing a trace. This peculiarity has delayed sending out the stock for a year or two, and at one time it was so nearly lost that only by striking cuttings could it be preserved.

Price, 3s. 6d. per Packet.

CHARLES SHARPE & Co., SLEAFORD.

SOME OF HOOPER & CO.'S SUPERB NOVELTIES.

"EARLIEST OF ALL" PEA

(LANTON).

Dwarf. Price, 3s. 6d. seed half-pint.

Opinions of Eminent Authorities:—

Mr. BARRON, Royal Horticultural Garden, Chiswick, writes:—"When I had the pleasure of visiting your Seed Farm last summer I was very highly pleased with the appearance of a Pea which very appropriately bore the name of Earliest of All, and it was not only a most cropper, the pods of good size, fine colour, and the quality, when cooked, really excellent. It seems to me that this will prove to be a very valuable and useful early Pea."

Mr. SUTHERLAND HENDERSON says:—"When visiting your Seed Farm in the past summer, I had an opportunity of seeing the Earliest of All Pea as a field crop and also as a table vegetable. In the latter case the pleasure of seeing was supplemented by the delight of tasting; and surely I have never met with such high table quality in a first early Pea. It is just the kind of thing we want, as hitherto our first early Peas have been notoriously wanting in quality."

Mr. GILBERT, of Barchin, writes:—"The earliest of all my Peas sown outside is the blue round early from you. Day's Sunrise is simply nowhere."

Mr. DOUGLAS, of Losford Hall, says:—"I think Earliest of All is an excellent early Pea. Growing side by side with Wilton I, it is quite as fruitful as that variety—rather earlier, and has the advantage of producing eight Peas in a pod—a number I have not yet obtained in any Pea so early as this."

PRIZES

For best Twenty-five Pods of this Pea at the Royal Horticultural Society, June 27.—1st Prize, 31s. 6d.; 2d, 21s.]

HOOPER'S ABUNDANCE TOMATO

Per packet, 1s.

"Enormously productive. The fruit of one plant 37 lb. 7 oz."

PRIZES

For this Tomato at the Royal Horticultural Society, July 25.—The Heaviest Fruit—1st Prize, 21s.; 2d, 10s. 6d. The Handsomest Dish of Nine Fruits—1st, 21s.; 2d, 10s. 6d.

QUEEN OF THE VALLEY POTATO

7 lb., 6s.; half bushel, 21s.; bushel, 31s. 6d.; three bushels, 80s.

"But, alas! for the mutability of earthly honours; even the Prime Minister had so unexpectedly popularised the 21-oz. tuber... the Messrs. Hooper, of Covent Garden, had exhibited at the Crystal Palace a regular whooper, against which even 21-oz. tubers became pigmies, for this huge specimen of the progeny of the Queen of the Valley weighed 2½ lb., or 49 oz."

Then ye wish that mankind to aid With idle dreams like Plato's, Betake ye rather to the spade, And plant some large Famos.

PRIZES

For this Potato at the Royal Horticultural Society, October 10.—For the Heaviest Tuber, 1st, 21s.; 2d, 10s. 6d. For the Best Nine Tubers, 1st, 15s.; 2d, 7s. 6d.

HARWOOD'S PRIZETAKER GIANT ASPARAGUS.

Half-ounce Packets, 1s.; one ounce, 1s. 6d.

"Taken invariably the 1st prize with the following astonishing particulars. The bunches were 10 inches long; in 1875 fifty heads weighed 7 lb. 2 in 1876, 7½ lb.; in 1877, 8 lb. 14 oz.; in 1878, 8 lb 2 oz.; in 1879, 100 heads 15½ lb."—The Gardener.

This is the Finest Stock of Asparagus in the World. Further particulars in Hooper's Spring CATALOGUE, post-free on application.

WILLIAMS' GIANT CYCLAMEN.

Having for many years devoted special attention to the improvement of the Cyclamen persicum, I had, a few years ago, the honour to introduce the improved types of Giant Cyclamen, with their splendid reflexed petals. They are now pronounced by growers all over the world (see Press Reports and Testimonials) to be the finest strain in cultivation. I still assiduously continue to bestow the greatest care to select such plants of these magnificent strains as are most suitable for the production of seed. My strains this year are without exception the finest ever offered.
The difference in price applies to quantity, the quality of all being alike.

MAGNIFICENT IMPORTATION OF BURMESE ORCHIDS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. SANDER, on MONDAY, January 30, at half-past 12 o'Clock precisely, a

GRAND IMPORTATION of ORCHIDS from BURMAH,

consisting of large quantities of DENDROBIUM WARDIANUM, DENDROBIUM CRASSINODE BARBERIANUM, DENDROBIUM FALCONERI, ten plants of DENDROBIUM RHODOPTERYGIUM, and other fine DENDROBES; also a large lot of DENDROCHILUM FILIFORME, CATTLEYA DOLOSA, AERIDES QUINQUEVULNERUM, and other importations.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

DENDROBIUM WARDIANUM.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, February 1, at half-past 12 o'Clock precisely, by order of Messrs. H. Low & Co., a large quantity of very choice Burmese ORCHIDS—the First Consignment of the Season from Mr. BOXALL—comprising:—

DENDROBIUM WARDIANUM and DENDROBIUM CRASSINODE, the unusually fine varieties sent by Mr. BOXALL some years since;

D. DEVONIANUM, D. FALCONERI, D. PRIMULINUM, D. THYSIFIORUM, D. CHRYSANTHUM, and D. either SUAVISIMUM or CHRYSOTOXUM.

The plants are to hand in splendid condition, and amongst them are numerous fine specimens.

At the same time will be offered strong Imported Plants of CATTLEYA LABIATA VARIETIES, many of which were seen by the Collector in flower in November last and marked by him as specially fine; also strong plants of ONCIDIUM MARSHALLIANUM.

On view morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

CATTLEYA LABIATA PERCIVALIANA
(Rchb. f.)

TRUE AUTUMN-FLOWERING LABIATA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by Order of Mr. F. SANDER, on THURSDAY, February 23, a wonderful Importation of this magnificent CATTLEYA. It is well known there are numerous varieties among the old Cattleya labiata, such as PESCATOREI, PICTA, &c., and the varied Bulb show that many varieties are among the lots offered. It is true Autumn-flowering. Flowers will be on view of this the finest Brazilian CATTLEYA: sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed with deep velvety-purple: in some varieties quite one half of the lip is dark; throat golden-yellow. We have never previously seen imported a Cattleya so floriferous: there is hardly a Bulb which has not flowered, and whose spike does not show three and four flower seats. Mr. Seidl, the lucky discoverer, states that one mass alone had 380 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importation, which is altogether in simply superb condition. The whole will be given into Mr. Stevens' hands, and comprise all that could be found, and none sold privately; but Mr. Sander earnestly invites prior inspection at the St. Alban's Nurseries, which are easily reached by the Midland, London and North-Western, or Great Northern Railways, from any of the Metropolitan Stations, Liverpool Street, King's Cross, or from St. Pancras, by fast train in half an hour.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

GENUINE SEEDS.

JAMES VEITCH & SONS, ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

DAHIA, SINGLE.

Saved from the new, distinct, and improved hybrids raised by Thomas Moore, Esq., of the Chelsea Botanic Gardens figured and described in the *Gardeners' Chronicle*, Octo. 22, 1881, and illustrated in the *Florist and Poinsettia*, July, 1880. They comprise the *Gracilis* and *Coccinea* types of this most beautiful border plant, the flowers being of long duration in bloom and extremely valuable for cutting. For descriptions see SEED CATALOGUE for 1882.

- DAHIA GRACILIS, finest new hybrids .. per pkt. 3. 6
- " COCCINEA, finest new hybrids 2. 6
- Collection of 6 separate new varieties of the coccinea, mexicana, and intercrossed forms .. per collection 7. 6
- Collection of 12 separate new varieties of the coccinea, mexicana, and intercrossed forms .. per collection 15. 0
- DAHIA (SINGLE) MIXED, all colours .. per pkt. 1. 0

BEGONIA, CHOICEST HYBRID.

James Veitch & Sons have given very particular attention to the hybridising of the new Tuberos-rooted Begonias. The seed now offered is the produce of the very finest kinds. The colours of the flowers are very brilliant, and comprise many beautiful shades of scarlet, crimson, orange, rose, &c. In habit the plants are dwarf, compact, and very free blooming, the individual flowers being of large size and good substance, and this strain is undoubtedly the finest that has yet been offered to the public. Per packet, 1s. 6d. and 2s. 6d.

POLYANTHUS.

- FINEST GOLD-LACED .. Per packet—s. d.
- MOTTLED, LARGE-FLOWERED 6d. and 1. 0
- MAGENTA KING 1. 0
- WHITE, LARGE-FLOWERED 1. 0
- YELLOW, LARGE-FLOWERED 1. 0

AMARYLLIS.

Saved from our magnificent collection grown at our Chelsea Nursery, from which so many exceedingly beautiful varieties of rich colour and improved shape have been selected by the Royal Horticultural Society for First-class Certificates. Per pkt., 2s. 6d.

CYCLAMEN PERSICUM.

Saved from the finest varieties, and cannot fail to produce flowers of the finest substance and of the most charming and diversified shades of colour. Per packet, 2s. 6d.

CYCLAMEN PERSICUM GRANDIFLORUM, a very large and greatly improved variety. The flowers measure 2 to 2½ inches in length, and are of fine form, with very broad massive petals. First-class Certificate. Per packet, 2s. 6d.

Our *Cyclamens* were awarded a SPECIAL CERTIFICATE by the ROYAL HORTICULTURAL SOCIETY.

GLOXINIA, VEITCH'S SUPERB STRAIN.

Our magnificent collection of this lovely decorative plant is well known. The seed now offered has been saved from the finest varieties, specially selected for that purpose, and will produce flowers of the finest quality, embracing all the fine tints of colour usually found in the genus. Per packet, 2s. 6d.

CELOSLIA PYRAMIDALIS.

- CELOSLIA PYRAMIDALIS AUREA .. Per packet—s. d.
- CELOSLIA PYRAMIDALIS COCCINEA 1. 0
- CELOSLIA PYRAMIDALIS PLUMOSA 1. 0

BALSAM, VEITCH'S SUPERB.

This fine strain has been specially selected by us while in bloom, and cannot be surpassed in doubleness, variety, and brilliancy of colour, form of flower, or habit of growth. Finest mixed colours. Per packet, 2s. 6d.

PRIMULA, VEITCH'S SCARLET GEM.

This beautiful variety cannot be too highly recommended, the brilliancy of colouring, and form and quality of the flowers placing it on an equality with our superb strains of Red and White Primulas, which are acknowledged to be the finest in cultivation. The flowers are of a charming shade of scarlet, of fine substance, and beautifully fringed, and the plant is of fine habit, the flowers being thrown well above the foliage.

Per packet, 2s. 6d.

PRIMULA SINENSIS FIMBRIATA RUBRA, Veitch's superb fringed, red. Per packet, 2s. 6d.

PRIMULA SINENSIS FIMBRIATA ALBA, Veitch's superb fringed, white. Per packet, 2s. 6d.

PRIMULA SINENSIS FIMBRIATA, Veitch's superb fringed, mixed. Per packet, 2s. 6d.

Our *Primulas* were awarded a SPECIAL CERTIFICATE by the ROYAL HORTICULTURAL SOCIETY for superior quality.

CALCEOLARIA, International Prize.

Saved from plants which have carried off the leading prizes at the chief Metropolitan Exhibitions, remarkable for its free flowering qualities, and the compact habit of its growth. The flowers are exceedingly rich and varied in colour, beautifully spotted and blotched, and of remarkably fine form and substance. Per packet, 2s. 6d.

PETUNIA VEITCH'S SUPERB STRIPED.

Selected for many years with great care; very constant, and produces beautifully striped and spotted flowers. Per packet, 1s.

MARIGOLD, Veitch's Superb Striped.

A fine selected strain of this favourite flower. Per pkt. 1s. 6d.

VIOLA, SNOWFLAKE.

A very dwarf variety, of compact habit, admirably adapted for spring bedding. The flowers are of medium size, long duration, and good substance, and are produced in great profusion. The plant is perfectly hardy, and comes into bloom very early in spring, its snow-white flowers making a fine display during the spring and summer months. Per packet, 1s.

WALLFLOWER, Veitch's Dwarf Dark Red.

A new and very superior selection, of rich dark colour, dwarf growth and bushy habit, fine for spring gardening. Per pkt., 1s.

NOTICE.
Messrs. Suttons' Novelties are subjected to
careful test trials, and all those offered this sea-
son are of sterling merit and perfectly distinct.

The Best New Pea of the Season.

AMERICAN WONDER PEA.

This valuable new early dwarf Wrinkled Pea was introduced by us last season. It is as early as our Kingleader, which is still the foremost Round White Pea. The haulm is thickly covered with fine pods, each containing from seven to ten Peas of delicious flavour. Height 10 to 12 inches. It is specially suited for large gardens, because it is unrivalled for forcing, and is far in advance of any previous introduction for a very early crop. Also unsurpassed for the Amateur's Garden because of its remarkable earliness, and the fact that, although it occupies only half the space of some other varieties, it produces double the crop.
Price, 6s. per quart, 2s. 6d. per pint.

From Mr. T. LOCKE, Gardener to the Right Hon. Lord O. FitzGerald.

"American Wonder" is exceedingly useful for forcing; only 10 inches high, producing a good crop of fine large Peas, of excellent flavour. Sown in a cold frame March 10, was ready for use May 10. For forcing it is far superior to "Little Gem" or "Tom Thumb."

For full particulars of the above and other Choice Varieties, see

The most Practical Work on Gardening yet published.

Beautifully Illustrated with Coloured and other Engravings, and containing full particulars of the

THE

Gardeners' Chronicle.

SATURDAY, JANUARY 28, 1882.

THE NEW FRUITS OF 1881.

IN respect of new fruits the past year, like many of its immediate predecessors, was not remarkable for any very marked or great addition to our stock. It may be described as, on the whole, a fruitful year, although, singularly enough, the greatest fruit-growing districts were the worst favoured. Apples were by far the most abundant, the crops generally being good and the individual fruits especially so. As a consequence, many of the shy-bearing, although old and recognised sorts, were brought very prominently under notice. These, however, can scarcely be deemed novelties—or, at all events, new fruits. There is one Apple, however, which stands prominently to the front, and as a new fruit, too, although it has been in cultivation in certain districts for a good many years, and its merits have been well known—we allude to Lane's Prince Albert, which during the past year has received the approbation of the Royal Horticultural Society as being one of the largest, most handsome, and best kitchen Apples yet introduced; and having noted its extraordinary cropping qualities at Derkhamstead we can most thoroughly recommend it. We would like also to speak favourably of Landsberger Reimette, a German variety, somewhat after the nature of Mank's Codlin, but extremely handsome, and of a wondrous freshness and richness of flesh when gathered fresh from the tree Kirke's Schöne Rambour, another German fruit, having a strong resemblance to Cox's Pomona, but even more handsome than that popular variety, the skin being more golden and keeping longer in good condition, deserves mention. A few very promising seedlings came under notice, but none of any very decided merit.

Of Pears the number of new aspirants was not nearly so numerous as usual, and it may be remarked that in general they were not very good. The only noticeable really new Pear was a seedling raised by Col. Trevor Clarke, from Marie Louise, and named Welton Hall Baurré. The fruit is of medium size, of greenish colour, and of very fair quality for a Pear grown in that somewhat cold locality. It is to be hoped that it may prove valuable for northern latitudes. We note also as one of the largest and most handsome Pears in cultivation a comparatively new variety named Marie Benoist, brought under notice by Mr. Haycock during the past season. It is wital of good quality, and will, we have no doubt, become a great favourite, especially for the exhibition table.

Of Cherries, Mr. Rivers gives us Guigne d'Annonay, a remarkably early variety, greatly resembling in appearance the Black Circassian. Of Plums there was no actual novelty, but Grand Duke—the latest novelty, it may be remarked—proved especially good. Amongst black Currants we have a great addition in the Black Champion of Mr. Dunnett, the berries of which are not only very large, but of extra quality, and hang well; and from America we hear of an extraordinary new red Currant, named Fay's New Prolific, with which we hope

to become better acquainted. Amongst Melons there is always a full supply of new names and never-ending variety, if there is little permanent improvement. At the present time we need only allude to High Cross Hybrid, from Mr. Hopkins, a handsome netted variety, with deep green flesh, and of excellent quality. The Newton Count, of Carmichael, may be named as very promising.

Grapes do not furnish anything remarkable as regards novelty this season, almost the only aspirant being Ollerheid's White. This is a large-bunched white Grape, intermediate in character between Trebbiano and Foster's White Seedling. If it should prove as early and as good a quality as the latter, and producing the big bunches and keeping as well as the former, it will prove an acquisition.

New Garden Plants.

PIPER BORNEENSE, *N. E. Brown.*

This is a new Pepper, that was introduced into Messrs. Veitch & Sons' nursery last year by Mr. Curtis, who discovered it in Western Borneo. It is not a plant that has any very special attractions to recommend it to the notice of horticulturalists generally, though it might find favour with some. The plant is of dwarf habit, with a thick hairy stem (made up of short internodes), well furnished with good-sized leaves, wrinkled and glabrous on the upper surface, hairy-pubescent beneath, 11-nerved, of a rich dark green, with broad but faint silvery-grey stripes between the principal nerves. If these stripes were more distinct and brighter, which it is possible they may become under the influence of more sunlight in summer, the plant would then be very ornamental and useful for decorative purposes.

Specifically Piper borneense is nearly related to the Javanese Piper muricatum, Bl., from which species it may readily be distinguished by its stouter stem with very much shorter internodes, rather differently shaped leaves, and axillary peduncles. The following is a description of Mr. Veitch's plant:—

Plant 9–12 inches high. **Dioecious.** Stem stout, terete, 4–6 lines thick, herbaceous, green, densely hairy, with rather long soft hairs, internodes $\frac{1}{2}$ –1 inch long. Leaves alternate, petioles stout, 1 inch long, green, densely hairy like the stem, vaginate nearly to the apex, vagina of a paler green, soon turning black, pubescent on the outside. Lamina elliptic or oblong-elliptic, acute, auriculate-cordate at the somewhat narrowed base, auricles rounded, upper surface glabrous, bullate-rugose, of a very dark green, with a somewhat indistinct, broad, silvery-grey stripe between each pair of lateral nerves, under-surface pale green, softly hairy, pubescent. Midrib slightly prominent above, hairy towards the base, very prominent beneath, as are all the other nerves and veins, primary lateral nerves five on each side of the midrib (the lowest one in the auricle on each side very small) opposite, all arising from the midrib below the middle of the leaf, most of them at an acute angle, they are curved and disappear in the margin in the upper part of the leaf, except the innermost pair which run into the apex; secondary veins transverse. Peduncles axillary, stout, 1–1 $\frac{1}{2}$ inch long, pale green, hairy. Spike cylindrical, $\frac{2}{3}$ – $\frac{3}{4}$ inches long, $\frac{1}{2}$ lines thick; bracts few, petalate, subsessile, glabrous; ovary sessile, glabrous; style obsolete, stigma 3–5. The rachis beneath the bracts is pubescent.

I have only seen the female plant, and the flower-spikes in this are at first green, soon changing to whitish; but this change of colour may not be the normal condition, but is perhaps accounted for by the abortion of the ovaries for want of the male plant, as the whole inflorescence appears rather soon to disarticulate at the base of the peduncle. If this species could be successfully hybridized by a variegated

Peperomia, such as P. Saundersii, a very interesting hybrid might result. Perhaps Messrs. Veitch will take the hint here given. *N. E. Brown.*

CHLOROPHYTUM KIRKII, *Baker, n. sp.**

This is a new species of the Antheroid genus, Chlorophytum, sent by Sir John Kirk from East Tropical Africa, which flowered for the first time at Kew this winter. It is nearly allied to the Cape C. elatum, K. Br., of which a form with variegated leaves is now often to be seen in gardens labelled Anthericum, or Phalangium variegatum, under which former name it is figured at tab. 152 of the new series of the *Floral Magazine*.

Description.—Root of long cylindrical fleshy fibres. Prostrate leaves 8–12 to a stem, subultrioribus, lanceolate, sessile, bright green, $\frac{1}{2}$ –2 feet long, 1– $\frac{1}{4}$ inch broad, with 12–14 hyaline chlorenchlorens on each side of the distinct midrib. Peduncle 1 foot long, simple, lorate, furnished with three or four erect much reduced leaves. Flowers in a moderately dense erect subcylindrical raceme, 3–4 inches long; pedicels mostly in pairs, $\frac{1}{4}$ inch long, jointed at the tip; bracts lanceolate, scarious. Perianth white, $\frac{1}{4}$ inch long; segments oblong, the three outer tinted green outside. Stamens as long as the perianth; ovary green, globose; style white, filiform, $\frac{1}{4}$ inch long. *J. G. Baker.*

BROADLANDS.

THE Hampshire residence of Lord Mount-Temple, and formerly that of his illustrious step-father, the late Lord Palmerston, who, in its improvement and management showed that vigorous energy which distinguished him in public life. It is situate on the sloping banks of the clear-running Test within a mile south-west of the lussy semi-agricultural and semi-manufacturing town of Romsey.

The park, of an irregular shape, extends about $\frac{1}{4}$ mile to the River Test, which here unites its various branches into a single channel, and spreads out into a broad expanse of ornamental water. This park exhibits many noble trees of various kinds scattered singly or in groups, arranged with exquisite taste and effect; especially noticeable being several fine specimens of the Cedar of Lebanon. On the side that abuts on Romsey it is about half a mile in length. The width of the valley of the Test is here almost three-quarters of a mile, if measured from the commencement of the rise on either side. Above Romsey it extends westward into a sort of basin, and again widens in the same direction opposite the middle of the entire length of Broadlands. Between these points it is narrowed by hills that jut out in gentle swellings, one of which slopes, lawn-like, towards the meadows, while the other stands out like a fortress made by Nature, and indeed bears the marks of having been once artificially fortified upon all except its steepest (west) side. The summit is remarkably flat, and covered with a green turf as soft to the tread as velvet. Mingled with the grass is an abundance of wild Thyme and other aromatic herbage, so that on a fine summer's day the whole place glitters with the glance of tiny wings, and the air is alive with the busy hum of bees, attracted thither by the fragrance. From the top of this eminence the views are exceedingly beautiful, and their effect is not a little heightened by being broken and separated by clumps of trees that are variously dispersed upon the crown and margin of the hill. These views are principally four, though, of course, they may yet be diversified if the spectators take up other positions. First, upon the right hand is a prospect down the valley and across Southampton Water to the New Forest; perhaps it may even extend, as the peasants of the neighbourhood say it does, to the Isle of Wight; but for this the day must be fine, and the atmosphere remarkably free from vapour; it may be doubted, too, whether much would be gained to the spectator by this extension of prospect, for nothing can be well imagined more beautiful than the nearer landscape, when the clouds, under the influence of a gentle west wind, are flinging their light shadows upon it, and for a moment interrupting the sunshine. Secondly, to the left of the scene just mentioned, is

the view of Broadlands, forming, with its home park, a graceful contrast to the beauties of Nature. Thirdly, comes the view of Romsey (on the Salisbury and Southampton line of railway), the only objection to which is the too great remoteness of the Abley church, the most interesting feature that the town presents—a fine specimen of Norman taste and Norman skill, carefully restored a few years since. Lastly, there is the view up the valley of the Test, which here assumes the appearance of an amphitheatre, with lined wooded margins, the bright streams glittering among the fields of the freest verdure, while here and there some bright trunk of a tree stands out amongst all this life and youth like a churchyard in some crowded city, as if to remind us that the scene, after all, is fleeting.

The kitchen garden, which is situate at the east side of the mansion, is enclosed and divided into four compartments by substantially brick-built walls 10 feet high, which are covered with fruit trees of the most approved kinds, all of which—especially the Peaches and Apricots—bear ample evidence of skillful management and congenial soil. Pyramids, too, of Peas—Tilmaston Duchess and Marie Louise—are also in a flourishing state on either side of some of the walks in these well-managed gardens, and were at the time of my visit (the end of September) carrying, like most of the other fruit trees, nice crops of fine fruit. *En passant*, I may remark that Mr. Thirly (Lord Mount-Temple's gardener) uses soap-suds as an insecticide, to the efficacy of which the healthy and luxuriant foliage of the Peach and other wall trees appear testified. This is applied to the trees late in the afternoon with the syringe or garden engine, and washed off the following morning with clear water. The walks which intersect these gardens, which were judiciously cropped with vegetables, bush fruit, and Strawberries, all in a high state of cultivation, are edged with ornamental tiles, alongside which was a good well grown batch of the Vicomtesse Hellecart de Thury Strawberries in pots. In addition to the kitchen garden, which covers an area of 3 acres, there is a 3-acre orchard a short distance from the former, which is also cropped with vegetables.

The fruit and plant-houses, excepting the orangery, are located in the kitchen garden, and are some sixteen or seventeen in number, besides pits and frames, which are necessary adjuncts to all garden establishments. There is no occasion for me to particularise the houses and their occupants here further than remarking that within the last three or four years Mr. Thirly has destroyed some of the old exhausted Vines, made new borders, and planted young Vines, and in some cases renovated the old ones. Some of the former—Muscat of Alexandria—planted in 1878, were carrying big bunches to each rod, which would average 2 $\frac{1}{2}$ lb. each. In the Lady Downe's house the Vines were bearing heavy crops of good-sized, well-finished bunches; the same may be said of many of the other vineries. The condition of the trees in the Peach and Fig-houses, as also those under the new Peach-case by Mr. Messenger, of Longborough, and to which Mr. Thirly laid on hot water last autumn, augur well for this year's crops. In the plant-houses, one of which (a nice span) has been recently erected, is a general collection of clean, nicely-grown plants, principally of a decorative character, noticeable amongst which were a few downy good plants of Calanthe Veitchii, a nice piece of Peristeria elata, a grand plant of Bougainvillea glabra planted against the back wall of the furnishing-house, where it forms an arch over a recessed water tank, then it is trained partly over the roof, whilst upon a shelf in one of these houses were a few dozen pots of splendid bulbs of Anaryllis aulica being rested, and in a hot-water pit hard by a fine lot of Cyclamens, which will now, together with the numerous other winter-flowering plants which are grown at Broadlands, be making a lively display in the houses there. A fine plant of Inantophyllum minimum, just going out of flower, and 4 feet through, deserves passing notice.

Mr. Thirly speaks very highly of a small free-setting variety of Melon named Orion; it is of good flavour, and is grown largely and well at Broadlands. Before leaving the well-appointed kitchen garden, I would like to refer to a few noteworthy trees which are growing in a plot in front of the forcing-houses—I refer to the Maidenhead Tree (Salisburia adiantifolia), which at 3 feet from the ground is 7 feet in circumference, from 35 to 40 feet high, and having a spread of

* *Chlorophytum Kirkii*, Baker, n. sp.—Folius 6–10 sessilibus subultrioribus, latis 1 $\frac{1}{2}$ –2 pediculis lanceolatis; pediculis petala foliis 2–3 velle reductis erectis lanceolatis; floribus in summo hinc erectis subultrioribus dispositis; pediculis primis perianthio ovulogulis apice articulatis; bracteis lanceolatis scariosis; perianthii albi parvi segmentis oblongo-lanceolatis; perianthibus perianthio ovulogulis.

branches of 45 feet; *Magnolias* (standard) *grandiflora*, *purpurea*, and *glauca*, splendidly flowered and filling the air with their perfume.

The pleasure grounds, which are north, south, and west of the mansion, are, as already hinted, beautifully situated, and contain many interesting spots and choice trees, some of which latter are noticeable for their graceful habit of growth, and others are remarkable on account of their great size, vigour, and beauty combined. Amongst the latter are two large Elms, a well-balanced pair, growing within a few feet of each other, and which at 3 feet measured 17 feet 6 inches and 18 feet respectively, and a little way from these representatives of the forest a handsome tree of the deciduous Cypress, about 100 feet high, the trunk of which at 3 feet from the ground measured 8 feet 2 inches in circumference.

The flower garden, which is nicely laid out and enclosed by a neatly kept ornamental Yew hedge about 2 feet high, with pyramids taken up on either side the walks leading thereto, and at short intervals between, is situated immediately opposite the south front of the house, the design of which is in character with the latter. Dwarf pyramids of golden and variegated *Hollies* are planted here and there in the turf, while fine specimens of American Aloe (*Agave americana*) in square boxes, standard and pyramidally-trained *Portugal Laurels* and *Bays*—the latter fine specimens—in tubs occupied prominent positions on the walks. These, together with the masses and mixed beds of the most telling and pleasing colours, which Mr. Thibily had effectively and harmoniously arranged, and the silvery sprays from the ornamental fountain (which occupies a central position) playing in the sunshine, complete a superb picture when contrasted with the expanse of greenward and the purring waters of the Test in the foreground, the picturesque mansion, Cedars and other stately trees in the background, and the New Forest away in the distance—south. I must not omit mentioning two oblong beds, one on either side the portico at the west front of the house, from whence they had a delightful effect, and which were really good examples of carpet bedding.

The orangery, a fine structure, also in the Italian style, with a portico and circular columns at the west end, abutting on the "New Forest Vista," is a short distance south of the flower garden, 40 yards long, 22 feet wide, and during the summer and autumn months is used as a conference hall (in which conferences Lord Mount-Temple takes part) by friendly societies and working-men's institutes, to whom, upon application, the use of this "hall," together with permission to roam *ad libitum* through the picturesque and well-kept grounds, are granted. And for the special enjoyment of the younger members of society who frequent Broadlands on such occasions, swings, &c., are suspended from lofty trees with leaves—

"Speckled with crimson, spotted with green,
And shaded with hues of Paradise."

The many thousands of people who from Southampton, Portsmouth, Salisbury, and intervening districts avail themselves annually of this privilege, show by their orderly conduct and hearty enjoyment of the beauties of Broadlands how thoroughly grateful and appreciative they are of Lord and Lady Mount-Temple's kindness and liberality in placing such enjoyment within their reach. In conclusion, I may be allowed to state that upon such occasions as those referred to, Lord and Lady Mount-Temple enter into the enjoyments of those assembled, towards which, by their presence and otherwise, they have contributed so much, and to whom the lines of the poet Cowper may not inaptly be applied—

"Tis to the virtues of such men man owes
His portion in the good that Heaven bestows."

Tourist.

BEGONIA SOCOTRANA.—This pretty winter-flowering species is still producing its blossoms in abundance at Messrs. Veitch's; even very small plants flower freely as soon as they are established. There are two varieties, differing slightly in the formation of the flowers, and more so in their colour, one being of a much deeper rosy-pink colour than the other. The very distinct orbiculate leaves, and the free, dwarf habit mark this plant as a valuable acquisition. The flowers would be most useful for cutting to put in vases.

THE KINGSTON-ON-THAMES NURSERY.

This extensive and well known nursery, having several branch departments in the neighbourhood of Kingston, the property of Messrs. Thomas Jackson & Son, is advantageously situated for business, being but a few minutes' walk or drive from the principal railway station, which is in direct communication with the metropolis and but a short distance from the junction of the South-Western Railway at Surbiton. The healthy, bracing climate of a district which has grown such a popular resort for pleasure seekers need hardly be mentioned as proof that plants and trees of all kinds are in the best possible condition that a favourable soil, climate, and a strict system of cultivation can establish.

The nursery is entered from Clarence Street, or, as it is often familiarly called, the old road to London. Upon the right of the entrance gate the show-house is gay with winter flowers, *Chrysanthemums*, *Mignonette*, *Heaths*, *Epacris*, *Primulas*, and *Cyclamens*, the *Chrysanthemums* when I saw them early in December being a show in themselves, comprising every variety in cultivation that has any reputation of merit. Before proceeding to describe the occupants of the houses, which are numerous and well adapted to their work, I may remark that hard-wooded *Heaths*, *Azaleas*, and New Holland plants are a speciality of the indoor stock, the *Heaths* alone being well worth a visit to the nursery. Messrs. Jackson's successes as exhibitors at all the leading shows entitle them to a foremost place among the names of the great plant growers of the kingdom, and their manager, Mr. Puttock, who has grown most of the plants from cuttings, may well be proud of the specimens he has nursed from their infancy.

In a long lean-to house with a north aspect are some grand specimens of *Rhododendrons* Countess of Haddington, *Princess Alice*, *Dalhoussiana*, well set with buds. What ornaments such plants would make for a show-house when in bloom? Other notable plants in the same structure are choice named *Camellias* in pots, and grand specimens of *Imantophyllum* miniature. In a division set apart for propagating there is a fine display of winter flowering *Begonias*, *Euphorbia jacquiniiflora* with from three to four plants in a pot, dwarf and healthy, and showing well for flowers. These plants are found to be very useful grown in 3-inch pots. The visitor who has time for a general look round will in the ordinary course find much to interest him in the different department—now trained specimens, from the handsome pyramid to the natural bush form—now of rare and fancy *Orchid*, then of florists' flowers, as the *Cyclamen*, *Primula*, *Pelargonium*, and *Bouvardia*.

There is such a thing as making a nursery interesting by arrangement, and this is exactly what Messrs. Jackson have done—all the gaiety is not squeezed into one house, while the rest contain monotonous-looking groups of flowerless plants. There is no confused mixing of plants, but flowering, foliage, and new and rare plants are so arranged in their respective houses as to afford agreeable variety to the ordinary visitor who is not an authority on plants. As bearing out these remarks, it will be observed that the next block of three span-roofed houses, 130 feet long each, is filled with a variety of plants that may be called gay at this season. These houses are conveniently arranged with side stages and a path up the centre. No. 1 is filled with seedling and other *Pelargoniums*. No. 2 contains stocks of silver tricolor *Pelargoniums*, *Cyclamens*, decorative *Pelargoniums*, including *Miss May Gill*, *Rosy Morn* (both raised and sent out by Messrs. Jackson), *Madame Thibaut* (double pink), *Bouvardias* in full flower; *White Vesuvius* *Pelargonium*, a mass of bloom; seedlings of *Aralia Sieboldi*, *Begonia insignis*, *Heliotropes* in full bloom; *Begonia Schmidtii*, a new white Continental variety; double *Primulas*, *Abutilons*, *Cyperus alternifolius*, and *Eschynanthus splendens*, a capital plant for basket-work in winter. The third house of the block contains among others a collection of succulents, of which there is rather a large stock of the old favourite *Koehia falcata*, *Cytisus*, *Salvias*, *Habrothamum aurantiacum*, sweet-scented *Pelargoniums*, *Chrysanthemum frutescens* and *Etoile d'Or*, *Cianthus*, *Cape Geraniums*, *Anemone Honorine Jobert*.

Of new plants, the Myrtle, *Jenny Reichenbach*, flowers freely in company with the above, the plants being no larger than ordinary grown *Lobelias* as seen in the flower garden in summer. The large *Camellia*

house contains a fine stock of *Camellias*, specimen *Azaleas*, of which *Duc de Nassau* is a noble plant, *Tree Ferns*, and other plants requiring a greenhouse temperature. Next to the latter structure the large *Heath-house* is reached, which is adorned with some of the finest-green specimens in the kingdom. One sample of *mutabilis* is in flower, and a grand example of *Erica kingstomensis*, which comes into flower about June, is in fine exhibition form. Other popular varieties among an extensive collection are *Erica ampullacea obtusa*, *aristata major*, *canadensis*, *Caevendishiana elegans*, *eximia*, *compacta*, *Irbiana*, *McNabiana*, *vestita*, *coccinea*, *veritellata*, *ventricosa*, *Bothwelliana*, *coccinea minor*, and many unnamed seedlings equal in quality to some of the named varieties. The plants are all kept close to the glass upon large inverted pots, and their general condition is excellent; in a word, they are show specimens ready grown.

Connected with the latter structure is a lean-to house facing the west, also containing an interesting collection of miscellaneous plants, including *Palms*, *Ferns*—among them good *Gleichenias*—in better health than they are usually seen in warm houses; *Orchids* in variety; *Kondeletia speciosa*, and a nice piece of *Microlepia lirta cristata*, a lovely Fern for furnishing. The collection of mixed hard-wooded plants is of equal merit with the *Ericas*, and quite as extensive. They occupy a large span structure, and consist of fine plants of *Stactes*, *Apulexis*, *Dracophyllum*, *Pimeleas*, *Chorozomas*, *Hederaomas*, *Boronia*, *Acrophyllum venosum* (which used to be very common at exhibitions), *Asclepias*, *Phenacommas*, and *Kalanthes*. I noticed a nice *Erica* (*Victoria Regina*) still out-of-doors for a special purpose, probably to retard the season of blooming.

There is a good collection of cool *Orchids* in a house by themselves, and a nice batch of *Diss grandiflora superba*, one of the loveliest of cool *Orchids*. The collection of stove plants embraces all the latest novelties, and the large span-roof structure in which they are arranged is a very interesting sight to lovers of fine-foliaged plants. *Ferns* and flowering plants are introduced by way of giving variety, and a very charming effect they have when tastefully arranged with foliage plants. There is a large assortment of *Anthuriums* of different varieties, fine *Aralias*, *Campylobotrys pyrrophylla*, *Crotons* in variety, *Dracenas*, *Cyanophyllum magnificum*, *Dieffenbachias*, *Maranthas*, choice *Palms*; and of flowering plants *Ixoras*, *Dipladenias*, *Franciscea*, *Euchoris*, *Clerodendrons*, *Catalpas*, *Hibiscus*, *Eranthemums*, and a good plant of *Gloriosa Plantii* trained upon the roof. A seedling Fern of Messrs. Jackson's, named *Pteris serrulata magnifica*, is a choice addition to our stock for cutting. In this house also there is a stock of *Asparagus plumosus*, and the fine specimen *Azalea* (*Jackson's crimson*) that was in the large collection exhibited at South Kensington in June of last year. The plant is being forced for a display of early flowers.

In smaller structures, span-roofed and well ventilated, there is a very fine collection of soft-wooded *Heaths*, *Hyemalis*, *Wilmoriana*, *gracilis*, and a group of North American *Pitcher-plants*. Next to this an *Orchid-house*, with *Anthuriums* (variety *Scherzeriana*) 3 to 4 feet across, and a general collection of free-flowering *Orchids*, as *Dendrobiums*, *Catleyas*, and *Oncidiums*, also quantities of *Ferns* for cutting and furnishing. *Adiantum Bausei* is largely grown for the latter purpose on account of the dark green colour of its fronds, which yield a very desirable effect in a sitting-room during the winter months, and also *Nephrolepis Duffii* and *N. davallodes furcans*. Still another *Orchid-house* filled with *Vandas* in fine condition, *Phalenopsis amabilis*, *Schilleriana*, and *grandiflora*, with splendid leaves 13 to 14 inches long and 6 inches in width, and with three to four breaks on each flower-spike, which will make a fine show when the plants are in bloom. I should mention specially a capital plant of *Vanda oerelia*, and a large plant of *Vanda teres*, *Saccolabium*, *Aerides*, and other species are numerous and well grown, and a variety of other plants, of which *Platycentrum alcei-rose*, *Braimea insignis* (a very scarce species of Tree Fern), *Palms*, *Marantas*, and a very fine specimen of *Phyllitenum Lindenii* are the chief and most noteworthy objects. The *Phyllitenum* is probably the largest plant in the country.

Pits and frames are filled with *Heaths*, *Daphne indica*, *Azalea mollis*, *Charles the Tenth Lilacs*, *Rhododendrons* and *Deutzias* for forcing. All these plants

are laden with flower-buds, and only require a gentle warmth to insure an early display of flowers at the turn of the year. The stock of pot Vines grown from eyes of the celebrated Hampton Court Vine are quite up to the usual standard of Vine growing in these nurseries. Messrs. Jackson have exceptionally good facilities for growing pot Vines in the Royal Gardens at Hampton Court, and the result is Vines of the best quality, well ripened and brown as Hazel. The first structure of importance that I have to notice contains valuable specimens of Camellias and Tree Ferns in pots, and specimen Azaleas in splendid order. The Azaleas are stood in a single row along the front stage close to the glass, and they are certainly a creditable exhibition in themselves, whether as regards cultivation or training. They are trained but not smoothed down with that degree of flatness which is fatal to anything like a free or natural appearance. Other plants of particular merit are *Eperis bellis*, *Chorozema Lowei*, *Rhododendron Comtesse de Derby*, *Edgworthii*, and *Comtesse of Haddington*. *H. Z.*

(To be continued.)

JOTTINGS ROUND ESHER.

WOLSEY GRANGE.—Whether for good or evil hereafter, the extraordinary mildness of the season has already produced a state of revolution in gardening. Go where one will there is fresh evidence of the advent of spring a full month earlier than usual. Plants under glass are making rapid progress, and many a greenhouse can boast of a better floral display during the first month of the year than has ever before been seen by the present generation of gardeners. The show house at Wolsey Grange, Esher, the residence of R. Few, Esq., is at present gay with plants of a very choice character—choice not so much because of the variety of the plants as because of their high cultivation and quality. Here are Camellias, red and white; *Deutzias*, *Platanus grandiflora*, pyramid-trained *Deutzias*, *Polygala Dulcamaria*, *Statice profusa*, *Azalea amena*, very neatly trained; grand plants of *Lobelia floribunda*, *Tetralinea verticillata*, *Cinerarias*, *Primulas*, *Cyclamens*, *Eperis*, and *Azaleas*. The house is kept at a greenhouse temperature. Roses in pots are fast swelling their buds, and in the plant-stove I noticed fine orange plants in fine condition, especially plants for furnishing which are highly coloured, chief of which are *Croton Lord Derby* and *C. albicans*, which is a favourite and is very prettily grown, and the surface of the pots covered with growing moss—a very good way of preparing plants for the dinner-table, or for vases in rooms. Mr. King is a very successful grower of soft-wooded plants, as the prize lists of various horticultural exhibitions abundantly testify.

ESHER LODGE is the seat of J. L. Eastwood, Esq., and stands on a sloping position, which commands a good view of the surrounding district, which in this part of Surrey is particularly interesting, owing to the immediate vicinity of one of the Royal residences, Claremont House, now in process of being put in order for Prince Leopold. It is a well authenticated fact, that most gardens of moderate size usually contain something interesting in the plant line, and the subject of this notice is no exception to the rule. The plant-houses are very gay just now with seasonable flowers, some of them indeed rather before their time. The stove plants, both flowering and foliage, are of rather exceptional merit, as for example, *Euphorbia jacquiniiflora*, *Lamotus rosea*, several varieties of *Cattleyas*, *Dendrobium densiflorum* and *D. crystallinum*, beautifully flowered upon a block; the flowers of this variety are very delicate, the upper petals shading to blue, and the lip a delicate pale yellow. In the insect-foliage division the finest plants are *Croton majusculus*, splendidly coloured; *C. Disraeli*, *C. intermixtus*, *C. undulatus*, and *Draecena amabilis*. Flowering plants include *Vincetoxicum*, which flowers all the year round; grand pots of *Eucharis*, *Platanus grandiflora*, *Imantophyllum nimbicum*, throwing up magnificent flower-spikes; and *Poinsettias pulcherrima* and *pulcherrima alba*, the latter showing some very fine bracts. The greenhouse is gay with *Primulas*, *Cinerarias*, *Chrysanthemum frutescens*, *Pelargoniums*, and a few New Holland plants showing bud; *Pinelæa spectabilis* almost in open bud—a rather unusual occurrence in January. The conservatory is filled with *Palms* and very fine Ferns, early *Deutzias*, flowering *Begonias*, and other seasonable flowers. There are some very fine examples of *Goniophlebium aureum appendiculatum* in this

house, which remain as permanent objects, and a very fine effect they produce all the year round, their drooping fronds being always so graceful in appearance.

SANDOWN HOUSE.—This compact and beautiful country seat, the residence of J. V. Currie, Esq., can boast of a garden that is both orderly managed, and is in a state of the very highest cultivation. Not only are walks and lawns in first-rate order, but fruit trees and vegetable quarters are quite a pleasure to look at. In a word, whatever is supposed to be under garden cultivation is looked after, whether it is within the walls or outside of them. But the houses naturally attract the eye of the horticultural visitor at this dull season. The greenhouse is doing duty as a show-house, and the front stage is very prettily arranged with *Solanums* in berry, *Hyacinths*, *Tulips*, *Cinerarias*, and *Mignonette* in flower, which imparts a welcome fragrance at this season. The large plants in the body of the house consist of good specimens of *Chorozema rotundifolia*, *Cytisus racemosus*, *Richardias* in flower, *Polygala Dulcamaria*, with its Pea-like flowers, and trained in a natural fashion to a trellis; several early *Azaleas* are also in flower, and many other plants in forward bud. The plant stove is gay with *Poinsettias*, flowering *Begonias*, *Euphorbia jacquiniiflora*, very finely grown in 48-sized pots, and tied loosely to a trellis-work upon the roof. There are several species of *Orchids*, including *Cyclopogon cristata*, *Oncidium sphecatatum*, *Dendrobium* of sorts, and a very fine form of *Anthurium Schzerianum*. In addition to the fine-foliaged plants and *Palms* are well grown for table, notably *Aralias*, *Crotons*, *Draecenas*, and *Pandanus Veitchii*. Mr. Beckett has distinguished himself as a cultivator and exhibitor of plants, both in plant groups, and trained specimens, having won His Royal Highness Prince Leopold's prize for a group of plants at the summer show of the Kingston-on-Thames Society in 1850. Mr. Beckett is also a successful exhibitor of *Chrysanthemum* cut blooms, his favourites being the Japanese section, and few people will differ with him in his taste. I noticed a fine stock of *Cinerarias*, *Calceolarias*, and stage *Pelargoniums* in frames, grown half-specimen fashion, which promise to make a good display later in the season. Plant growing is evidently an important feature in this well-managed garden. *Visitor.*

DRINKSTONE PARK.

THE seat of S. N. Powell, Esq., near Bury St. Edmunds, has long been famed for the Roses and the excellence of its general collection of plants. Mr. Nichol, the late gardener, and Mr. Palmer, his able successor, have carried off many provincial and not a few metropolitan prizes for Roses. The soil is a heavy loam, the site somewhat sheltered, and these favoured conditions helped by skill led to success. The Grapes on young Vines have also been very fine. But of late years Drinkstone is acquiring a new fame, that is, for its *Orchids*. The proprietor takes a lively interest in horticulture, and without losing his love for Roses, has taken to *Orchids*, with exemplary energy and success. Being fond of mechanism as well as practical science, he varies his chemical and other experiments with basket-making for his *Orchids*, and in this and other ways combines utility with recreation. He has, in a word, made *Orchid* growing one of his chief hobbies, and, ably seconded by Mr. Palmer, the result is a great success. Having the courage to abolish bedding-out, Mr. Powell has also dared to select specialties among *Orchids*; and instead of a general collection, including all the classes, has chiefly concentrated his strength on *Phalænopsis* and *Ophrysoglossum*. Hence, while a great many *Dendrobiums*, *Oncidiums*, *Cypripediums*, *Lælias*, *Macdowellias*, &c., are well grown at Drinkstone, the two first genera are grown in quantity and in first-rate style.

Of *Phalænopsis* over sixty plants are grown. These consist of five varieties of *amabilis grandiflora*, and *Schilleriana*, with a few plants of *rosea* and *Luddeemanniana*. They are now (the middle of January) a sight to see, most of the *amabilis* and several fine spikes of *Schilleriana* being in full flower, and the latter one showing very fine spikes. The plants are in robust health, the leaves, that add so much to the interest and beauty of such plants, being without speck or flaw. Most of the plants are set on the top of latticed cylinders, 18 inches or more in height, designed and made by Mr. Powell, which brings

them near to the glass. The base of these acts as a sort of shallow trough or shelf filled with broken coke. The whole of the bed of the houses is also furnished with this. It is frequently sprinkled with water, which is quickly absorbed, and gives out vapour when the dryness of the atmosphere requires it—the coke thus acting as a regulating vapouriser; it also has a unique and cleanly appearance. Great care is taken to prevent the roots from grasping the bottom shelf and coke, though they are encouraged to lay hold of the sides of the upright cylinders as freely as possible. These arrangements seem to suit the plants admirably, as they were in the most robust health. Several of the *amabilis*, however, had their roots in the free atmosphere, and looked as healthy as those mounted on the latticed cylinders. Next to the *Phalænopsis* the grandest feature at Drinkstone was without doubt the *Odontoglossum*. The house was a perfect blaze with *O. crispum* (Alexander), and others. Some of these had had, or had still, from twenty to twenty-four flowers to a spike, and the plants were in the most robust health, and many of them the finest varieties of this charming *Orchid*, which is almost a collection in itself. Among other fine *Odontoglossum* in flower were *Pescatorei*, *cirrosium*, *roseum*, *tripudians*, *Illwili*, *Rossii*, *Rossii majus*, and the chaste and fragrant *paluchellum*.

There was a specially fine lot of *Calanthe Veitchii*, *vestita*, *vestita rubra*, and *oculata*, or *latea*, in full and fine bloom; these were grown in pots, and not in pans as so frequently practised and advised. A few large pots of the old *Bletia hyacinthina* were also remarkably strong. Among other *Orchids* in flower were *Mastveillia Veitchii*, and some fine pans of the delicate and useful *M. tovarensis*, the latter showing to striking advantage in contrast with the vivid *Sophronitis grandiflora*, *Lælia anceps*, *albida*, and *autumnalis*; *Vanda gigantea*, *Phaus grandiflora*, *Saccolabium giganteum*, *Lycaste Skinneri*, *Maxillaria grandiflora*, *Platanus fragrans*, *Cymbidium eburneum*, *C. Lowii*, *Pleione humilis*, and *Mesospidium sanguineum*, and *M. vulcanicum*. Amongst *Dendrobiums* and *Oncids* the following were either in, or just coming into, bloom:—*D. Wardianum* (several fine plants), *D. heterocarpum*, *Oncidium cucullatum*, *O. cheiroporum*, *O. ornithorhynchum*. *Cypripediums* were well represented by *barbatum*, *villosum*, *insigne*, *insigne Maulei*, and *venustum*. The striking *Angreecum sesquipedale* was represented by two nice specimens; *A. citratum* was also in bloom, as was the rare, choice, and seldom met with *Trichosma saxiviv*. Other things, such as *Roses*, *Vines*, *Peaches*, *Lagararias*, *greenhouse* and *stove* plants, *Ferns*, &c., are remarkably well done at Drinkstone, and a house is devoted to fruiting the *Passiflora quadrangularis*, which is much prized for dessert; but my object now is merely to note the *Orchids* in bloom in the middle of January, and it must be admitted that for a new collection and a private place I have been able to chronicle such a bouquet of sweetness and beauty as must afford much satisfaction to the proprietor, and reflect well-merited credit on Mr. Palmer, his able and zealous gardener. *Quærens.*

The Nursery.

ROSES ON THEIR OWN ROOTS.—I have read with much interest the communications of your correspondents, "Wild Rose," and the Rev. E. Fellows, on the much debated subject of *Roses* raised from cuttings. Quantities of trimmings are annually thrown away which would yield serviceable plants for general garden embellishment, if removed at a proper time, and duly inserted before the least exhaustion is occasioned by the drying of the tissues by exposure after separation from the parent stock. I have not at any time struck very large quantities of *Rose* cuttings, but annually insert a few, which prove most successful when taken with a heel during August, or early in September. At this time much of the wood that has bloomed may be cut away to encourage the thorough maturing of the young strong shoots from near the base of the plants; and thus much of the best ripened and most suitable growths can be procured with heels for propagation, without injury, and, in fact, with advantage to the future welfare of the bushes operated upon. The majority of own-root *Roses* are prone to exhibit a somewhat thinner arrangement of petals

than those of the same variety worked on vigorous stocks, at least for some years, and until they become very strongly established. One point to be observed, whether with Teas under glass or hybrid peonials inserted in the open ground, is to prevent rapid evaporation by reducing the shade and burying the greatest portion of the canes underneath the soil. Tea Roses when once established do even better on their own roots than when worked, but they are very liable to lose their roots during the first season after striking if at once planted out, and are consequently in some instances considered shy growers under such conditions of cultivation, and further effort to establish them on their own roots is from this cause abandoned. A stock of them is most readily got up by putting in during summer the half-tipped shoots, which are kept quite close until struck, then gradually ventilated before being potted off into small pots for the winter, from which they must be shifted into larger ones in the spring and kept potted on for one year. Strongly established plants of a year old will have developed their tough woody roots, which will resist the destructive effect that cold and wet soil has on the immature roots of recently struck Teas, which of all Roses seem the most liable in this respect. I have not observed that any varieties resist to root, but it is evidently scarcely worth while trying the weaker growing sorts of hybrid perennials when there are so many strong growers manifestly suited to be self-supporting. Mr. Fellowes may await with confidence the result of his experiment with the Baroness, as it will form roots in this country, however peculiar it may be in that respect in America. Some five years ago cuttings of it and the other exceptionally difficult one to root quoted by "Wild Rose," Madame Lacharme, were inserted on a north border in common with other varieties, and there are now in vigorous health plants of both varieties in the rosery resulting from that hatch; but, if my memory serves me correctly, they yielded a lower average result of rooted plants than other sorts.

Amongst the freest of Roses to root may be mentioned Duke of Teck, every cutting of which speedily becomes a rooted plant. Propagation by cuttings will not, however, take the place of budding, but can only be viewed as a supplementary mode of supply; for it will always be necessary to increase new varieties more quickly than can be done by cuttings, and even the private grower who buys in a new Rose of the current year must be content to bud up a stock of it before any quantity of cuttings will be available for the increase of the variety. Roses on their own roots for old places, such as mixed flower borders, shrubberies, &c., and for distribution in cottage gardens in country villages, cannot be too highly recommended. *R. Crossing.*

ROSES AT THE OAK HILL NURSERY.—To have cut Roses all through the winter months is an object which has been accomplished by few, although attempted by many. Reference is not particularly made to the occasional good luck of producing a stray bloom or two, but to the constant production of cut Roses throughout the entire winter, when Rose-bushes are in great demand for buttonholes and ball bouquets, and bring the cultivator a highly remunerative price. Mr. Rose, of the Oak Hill Nursery, Surbiton, has a capital show of Roses at the present time, and the same plants have been in flower for some time past. Only one variety is grown by Mr. Rose for this purpose, which very much resembles the Duchess of Edinburgh in colour, and has small leaves not unlike the common monthly Rose of gardens. This variety is grown by hundreds, indeed one house alone contains 500 plants in 8 inch pots, clearly showing in what high estimation the plant is held for winter flowering. The plants are remarkable for their sturdy habit and general appearance of good health. The buds are produced in great profusion, and vary in colour from light red to a delicate lilac shade, which is the result of a rather warm temperature and insufficient light. *H.*

FRUIT NOTES.

Cherries.—Several kinds of fruit have had some notice of late, but little has been said about Cherries, which are as important as any, and as the time for planting, though late, has not yet passed by, a few notes respecting them may yet be of use to those not well acquainted with the different sorts. The one I would first call attention to is Governor Wood, an American kind, sent out some twenty years ago, which besides being a prodigious bearer, ripens very early, and is a valuable sort for dessert. The fruit is large, obtuse, heart-shaped, and has a pale yellow skin, which becomes mottled and rosy-coloured on the sunny side, thus giving it a rich-looking tempting appearance. When quite ripe it is nearly transparent, full of sweet refreshing juice, delicious in flavour. The next in

point of earliness, and one equally desirable, is Fingermore Bigarreau, the fruit of which, if the trees are in a warm sunny aspect, ripens about the middle of July, and is most luscious. In size and shape it is like the old Bigarreau, but has more colour, and is a valuable kind for an orchard-house, although it does not bear so freely as Governor Wood. Take it all in all the finest Cherry as a mid-season variety is the Elton, which is very large, exquisitely flavoured, and one that makes a remarkably telling dish amongst a dessert. The Bigarreau is an old favourite, greatly resembling the last-named, as it bears large heart-shaped fruit of a pale whitish-yellow colour on the shady side, streaked with red next the sun, and if allowed to hang till quite ripe is most luscious. Many others as there are these are all amongst the white class that are worth growing for dessert, unless later sorts be desired, when Belle Agathe and Late Duke should be chosen. Among the blackes the earliest and best is Black Eagle, which ripens in July; and though not large is a handsome looking Cherry, very firm, sweet, and nice eating. The next in point of merit and earliness is Knight's Early Black, which is a fine noble-looking fruit, larger than Black Eagle, but not quite so good in quality. As a show kind none surpass the Black Circassian, which bears very large heart-shaped fruit of a deep bluish-black colour, but not first-class in flavour. The foregoing and Verdel's Early Black are about the only ones worth growing for dessert, the best situation for them being an east or west wall, where they ripen well and come of good quality. For culinary purposes during the summer there are none to rival the May Duke, which is a fine sub-acid kind and a prodigious cropper, as when the trees are closely spaced and well managed the fruit hangs in thick bunchy clusters. Another very useful Cherry for cooking is the Kentish, the stone of which is so tightly attached to the stalk that it may be drawn out with it, and this is generally done before making use of it in tarts. The most valuable Cherry for kitchen purposes after the May Duke is the Morello, which succeeds well on a north wall, where, if protected, it will hang till very late in the season. The best way to cultivate this valuable Cherry to obtain heavy crops is to support the main branches against the wall, and allow the young shoots to grow somewhat freely, as on these the Cherries are borne. Any thinning that is requisite can be done in the winter, when the finest and most healthy of the shoots should be left. Morellos also do remarkably well grown as bushes, pyramids, or standards, or they may be trained to wires, as espaliers, which is a very good way of managing them, as they can be more easily moved than the average of kinds. Dessert kinds, such as those mentioned, may likewise be grown in the same manner, or as closely spiced bushes, when, if planted together, they may easily be wired round and netted in over the tops. *J. S.*

Very Late Pears.—A correspondent lately asked a question very much to the point concerning Knight's Monarch. In the East of England, speaking from personal experience, the fruit always drops prematurely, shrivels, and never ripens properly. In Somersetshire and Scotland I have had the Monarch very good, the fruit ripening in a long succession. As every pomologist knows, the tree is a most abundant bearer, but I am afraid cursed with the dire habit of shedding its fruit prematurely in nearly every locality. Mr. Rust laments the scarcity of good late Pears—a glance through Leroy's *Dormitive* opens up a whole galaxy of late Pears. I have heard of an *Index expurgatorius*, but surely there must be a number of them really distinct and good. There seems to be no enterprise in the trade to import and try thoroughly, or perhaps the fault is with us—we feebly complain, but do not set to work to remedy. There are many Pears ripening from January onwards well worthy of being grown, such as Bonneserre de Saint-Denis, General Duvivier, Maréchal Vaillant, Marquette de Milleville, Octave Lachambre, Olivier de Serres, Fiance Napoleon, and Beurré de Bolwiler. Others that have been recommended to me are Doyenné d'Alençon, Lydia Thiercelin, Masqué d'Espéran, Bourré van Dreissche, Belle Moulinoise. With a little care Alexandre Lamure, my pet of all Pears, Duchesse de Bordeaux, Marie Benoist, Louis-Victorin, and others will keep till near the end of January. I have before recommended Fiance Napoleon and Marquette de Milleville: the latter is truly an *arbre expurgé*, but the fruit is large, melting, and juicy, not unlike Bergamotte d'Espéran (which cannot be planted too largely) in appearance; it ripens when all other sorts are done, and for the season is really good. Josephine de Malines is very variable in quality, and Jean de Witte I have never had good. Has any correspondent ever ripened a fruit of Beurré de Mal? My best Pear this year has been Doyenné Robin. *H. Carnahan.*

The Arboretum.

HARDY TREES AND SHRUBS.—A committee of the Massachusetts Horticultural Society has been discussing a list of the best twenty deciduous shrubs and a similar number of evergreens for Massachusetts. Two lists are given, one for small places, the other for plantations of larger extent. It will be remembered that the winter climate of Massachusetts is in general much more severe than our own, though the summer is hotter and the atmosphere clearer. The following are the lists in question:—

- Deciduous Trees.*
 Golden Locust
 Variegated Maple
 Weeping Cypress
 Weeping Bird Cherry
 Variegated Dogwood
 Virginia (Yellow-wood)
 Magnolia cordata
 " Soulangiana
 " conspicua
 " glauca-longifolia
 " Lenoxii
 Camperdown Weeping Elm
- Shrubs.*
 Dwarf Horse Chestnut
 Oak-leaved Hydrangea
 Hydrangea paniculata grandiflora
 Vitivornum plicatum
 Berberis Beala
 " japonica
 Scarlet Dogwood
 New-Weeping Scarlet Thorn
 New White Double Thorn
 New Double Scarlet Thorn
- Evergreens.*
 George Peabody Arbor-vitæ
 Veronese's Arbor-vitæ
 Senner aenea Arbor-vitæ
 The Retino pines
 Cephalis, Lawsonii
 " duplex
 American Holly
 Virginia Spruce
 Thuopsis dolabrata
 " betulifolia
 Pinus Cedrus

The next list, by H. H. Hunnewell, is intended for a much more extensive place than the above.

- Deciduous Trees.*
 Tulare
 Magnolia acuminata
 Magnolia Lenoxii
 Linden American
 " American
 Virginia white (Yellow wood)
 Sassafras (Ginkgo)
 Dogwood
 Cedrus
 Flowering Cherry
 Birch American
 Liquidambar
 Weeping Willow
- Conifers.*
 Abies alba (White Spruce)
 " canadensis (Hemlock)
 " Spruce
 " Spruce (Norway)
 " orientalis (Oriental)
 " Menziesii
 " Aleutica
 " Douglasii
 " Nordmanniana (Nordmann's Fir)
 " cephalonica
- Maple, Rettenbach's purple*
 " Scarlet
 " Schwedler's
 " Sugar
 " Weir's Weeping
 Magnolia acuminata
 " japonica
 Tulare-tree
 Virginia, or Yellow-wood
 Walnut, Black

The following list was selected by William C. Strong:—

- Deciduous Trees.*
 Acaea, Three-thorned
 Beech, American
 " Purple
 " Weeping
 Birch, cut-leaved Weeping
 Cherry, Myrtle-leaved
 " Weeping
 Elm, American
 " Camperdown Weeping
 Golden (Saxifraga)
 Maple, Norway
- Shrubs.*
 Almond, Double White
 Ardisia, China
 Clethra aliflora
 Cornus sanguinea
 " japonica
 Deutzia crenata flore pleno
 Fuchsia grandiflora
 Forsythia viridiflora
 " longicaule, White
 Hydrangea paniculata grandiflora
- Evergreen Trees.*
 Pinus White
 Retinospora filifera
 " pinus
 " pinus strobus
 " quadrifida
 " Virginica
 Spruce, Hemlock
 " Norway
 " New-Weeping
 " Oriental
 " White
- Maple, Rettenbach's purple
 " Scarlet
 " Schwedler's
 " Sugar
 " Weir's Weeping
 Magnolia acuminata
 " japonica
 Tulare-tree
 Virginia, or Yellow-wood
 Walnut, Black

PROLIFEROUS CONES.

It is not necessary to enter very deeply into the history of plant construction to see the contrast between vegetative growth and reproductive growth, shoot production and leaf formation, let us say. In the one the tendency is towards contraction, concentration, accumulation and concentration of food, and change in structure; in the other towards extension and repetition of similar parts and diffusion of food supply.

The distinction is so obvious and so important that many of our cultural practices are based upon it. By transplanting, re-training, girdling, withholding water, and a score of such means, we check growth in one direction in order to facilitate the production of flower buds, fruits, or seeds. Nevertheless, though once established, the contrast is great, there can be no sort of doubt that the two tendencies have had one common starting point whence divergence has gradually taken place in this direction, or in that, according to circumstances and the needs and pliability of the plant. In the lowest plants or animals the contrast between the two tendencies is not always manifest, and where it is so it is reduced to its simplest expression. In one "cell," or in one bit of protoplasm, take place all the processes of life. Then, as we mount higher in the scale, one bit

office. If we see one machine doing the same sort of work as another, we naturally draw the inference that, despite any superficial or accidental difference in appearance, the nature of the machinery in the two cases is substantially identical; and so, if we find in a plant a scale doing duty for a leaf, or a leaf fulfil-

have not yet explained, to the general satisfaction of all concerned, the exact nature of the Fir cone, but that is no matter for our present purpose. All that we set out to do is to illustrate our previous statements, and to indicate certain appearances easily observable, and concerning which, if we do not plunge too deeply into theoretical explanations, there is no controversy.

Any ordinary Fir cone will show the tendency to arrest in growth and coincident change in appearance and structure which have been spoken of as characterising reproduction rather than growth, and, if the cone be examined while still growing on the tree, it is in general not difficult to satisfy one's self that the cone is no new structure stuck on or developed from the end of the shoot, but is only the end of that shoot itself which has undergone sundry modifications.

The Larch cone, fig. 16, shows a not unfrequent condition where the branch has, as is said in common parlance, grown through—the cone; really the tip of the cone, from some cause or another, has lengthened into a leaf-shoot. This condition is so common in *Cryptomeria* in our experience as to be nearly as frequently met with as the more normal state. It may be that our summers are not hot enough to cause that arrest of growth which occurs under other circum-

FIG. 17.—THE DOUGLAS FIR.
A, Normal bract; B, the same seen from the side attached to the scale at the base; C, Bract and seed-scale from the outside; D, Bract from a proliferous cone passing into leafy condition, in E, F the bract is completely leafy—E seen from the outside, F from the inside.

FIG. 15.—DETAILS FROM CONE SIMILAR TO THAT SHOWN AT FIG. 18.
A, Bract and scale from the side and from the back respectively; B, Section of A, to show detachment of scale and bract; C, Bract; D, Bract and portion of "needle" from proliferous cone, seen from the back.

FIG. 16.—PROLIFEROUS CONE OF SCIAPODITYS.
A, Proliferous cone of Sciadopitys; B, Leafy bract and seed-scale; C, Leafy bract, the seed rudimentary; D, E, Abnormal scales with trace of scales.

of protoplasm becomes set apart to do certain work—another bit to do something else. Primal simplicity gives place to division of labour. Changing conditions and altered circumstances demand corresponding pliability on the part of the organism, and so in the higher plants we find the well-marked distinctions we have been alluding to. But even in those higher plants, if we study their individual life-history, we shall find in the course of the career of each one of them precisely the same sort of evidence as to the common origin in what we may term structureless simplicity of organisation, of the complexity and contrasted structures of the adult individual plant as we have done in the case of the group. In other words the life-history of the individual plant and the life-history of the entire vegetable world may broadly be told in the same words, because, in principle, they are the same. And so, when we trace any one individual plant from its earliest condition as a mere speck of protoplasm, through all its gradually increasing stages of complexity to its final condition, or whether we investigate the lower organisms, as we call them for convenience sake, and compare them one with another in their stages of progression, the course is the same—from simplicity and uniformity to diversity and contrast.

There are also occasionally to be met with other indications of the original oneness of composition and

ling the office of a scale, we take it as pretty good evidence that leaf and scale, scale and leaf, despite their obvious superficial differences, are fundamentally one and the same; and if the testimony so afforded be substantiated by evidence derived from other sources, the case becomes then established.

The accompanying illustrations will afford further exemplification of our meaning. The morphologists

stances, but that is a mere surmise. Our purpose is simply to exemplify the propositions previously laid down, and we think these Fir cones do so satisfactorily. But there are other points to which we can make only passing allusion: they are of very great interest to the botanist, but at present they do not throw much light on points of practical horticulture. In some cones, as in that of the Cypress, the seed-scales are simple, with these we have nothing to do; in others outside the woody seed-scale is a bract or leaf-scale. It is this latter which is so prominent in the cones of the Douglas Fir (fig. 17) and which adds such beauty to the cones of *Abies nobilis* or *bracteata*. A glance at the cone when growing will usually suffice to show that the bract just mentioned is, what we have termed it, a leaf-scale, for it is continuous with and in a direct sequence with the leaves though itself usually a mere brown scale. In the out-growing cones just mentioned the nature of the bract becomes still more evident, as in them it generally shows itself what it really is, a leaf. The illustrations at fig. 17 will show this. Within this bract is the more or less woody seed-scale, an aggregation of which forms the mass of the cone, and upon the upper surface of which lie the seeds. Now, as to the true nature of this seed-scale, the conflict of opinion still wages. We have no inten-

tion of taking sides in this conflict, for it would lead to too long, and perhaps in this place not very entertaining, discussion. The botanist, however, will see in the details of the Larch cone (fig. 16, c, d, E), evidence in support of the opinion adopted by Caspary and others, that the seed-scale is composed of a shoot and two side leaves, all usually arrested in growth and forming one woody mass. Be that as it may, there is in these cones a bract which no doubt is a leaf, and there is a seed-scale upon which nothing more need be said here.

Now, let us turn to the cone of *Sciadopitys* figured at fig. 18. Knowing the difference of opinion that pertains as to the real nature of the so-called leaves of the plant, as well as to the nature of the cone, the sight of the figure in Messrs. Veitch's *Manual of Conifers* inspired us with a curiosity which none but a botanist could appreciate.

FIG. 20.—BRANCH AND CONE OF *SCIADOPITYS*: NORMAL.

Messrs. Veitch have kindly lent us the woodcut (fig. 18), and, better still, they have allowed us to examine a cone similar to the one figured, but less perfect. From that examination we are enabled to say that the state of things is very different from what obtains in the outgoing cones of Larch or *Cryptomeria*; the bract-scale (see fig. 19) remains as a scale like that surrounding the base of the tufts of leaves, and which does not become leafy; while the seed-scale, in normal cones blended with the bract (fig. 20), first becomes separated from it, and then gradually assumes the appearance of a leaf, or of a leafy shoot, if we adopt the latter view of its nature (fig. 19, D). It would seem to follow from this, that whatever be the nature of the so-called leaf of *Sciadopitys* it must be essentially the same as that of the seed-scale of the *Abietineæ*, and if so, it contributes a remarkably interesting item in the discussion of a problem of which, in this case, we can indicate the general nature only. *M. T. M.*

THE GENUS *FREESIA*.

The bloom of *Freesia refracta* which I send with this is not much to boast of in itself, being small, with only two flowers on the spike, and one of those deformed, but is of interest inasmuch as it was borne by a plant which less than twelvemonths ago was an unimpregnated ovule. A pot of *Freesia* came into bloom in my greenhouse on Feb. 2, 1881, and continued to flower for some time. Several flowers were artificially impregnated (the stigma is raised so high above the anthers that self-fertilization is almost impossible) and went to seed. Some of the seed as soon as ripe was sown in a 48-pot some time in the summer; of the exact date I have no memorandum. In the course of the autumn the seed germinated, and from the number of seedlings which appeared I think hardly a seed can have failed. Kept in a cool green-

separate names. I possess at present three forms. The first of these (A) grows freely, and bears large flowers of a pale yellow, with a slight tinge of green, the paleness or deficient saturation of the yellow varying somewhat in the different flowers. The form of the flower is characteristic: the perianth tube towards its lower part suddenly narrows, and the perianth segments spread out, but not so as to become horizontal, since they do not pass through more than about 45° or 60°. The second (B) is of a dead white with a tube relatively longer and more slender than that of A, and narrowing below much more gradually; the perianth segments spread out nearly horizontally, and the throat of the tube is smaller than in A. Moreover, the style projects more above the perianth than in A, and the ovary seems less distinctly trigonal; but these latter characters are possibly not constant. The form of the perianth gives the flower quite a distinct aspect. The third form (C) is in colour of a deeper, more saturated yellow than A, but with a more obvious tinge of green, and with obscure purple stripes on the inside of the tube. The perianth tube segments spread out so slightly that their curves form simply a continuation of that of the perianth tube, which, like A, narrows suddenly below, and the whole plant is less vigorous. In all three forms, even in the white one, the orange blotches on the perianth segments below the anthers are well marked. These blotches appear to serve as "insect signals," like the corresponding marks on other liliæ.

The form A, which I had under the name of *F. refracta alba*, seems to deserve the name *F. refracta grandiflora*; it corresponds closely to the specimens in Kew Herbarium bearing that name. The seedling and seed come from this form; it exactly resembles its parent save that it is small and pale.

The forms B and C both come from three bulbs which I bought as *F. Leichlinii*; C corresponds very truly to *F. Leichlinii*, but it seems obviously to be *F. refracta alba* (there had evidently been a mixture of bulbs in the sample which I purchased).

All these three forms differ clearly from what may be considered as the typical *refracta*, the *F. refracta* of Klatt, and the *Gladia refracta* of Rebutin, in which the flowers are of a greenish-yellow, largely marked with purple or violet streaks and blotches, and in which the spathe-valves are wholly membranous—not merely green, with membranous edges, as in the three above forms.

Whether the *F. odorata* of Klatt, characterised by intensely yellow flowers and narrow leaves, is as distinct does not seem so clear; and the same may be said of the *F. xanthopala* of Klatt, the anthers of which are marked with purple.

There is nothing very extraordinary in even a bulbous liliæ flowering the first year from seed, since *Turkella* will do the same; but the fact seems worth knowing, since these *Freesias* are not only charming flowers to look at, but have a delicate, delicious fragrance, and last a long time as cut blooms. If any that any practical gardener who took them in hand, for the purpose of furnishing cut flowers at this season of the year, would find them pny.

It is true I have heard complaints of their being difficult to bloom, but I have not experienced any trouble with them except at the beginning. I believe that the cardinal points in their culture are—1st, give them plenty of water while they are growing, but ripen the bulbs by roasting the plants as soon as they have done growing and the leaves begin to wither; 2d, do not let the bulbs be out of the soil a moment longer than you can possibly help. Keep them dry in the old pots until you are ready to repot them; and, provided the soil is not overwatered, they will do all the better if they are kept a second year in the same pot, with a super added refuse-ling just as they start into growth; 3d, ripen them at a low temperature, avoiding frost of course, until they are nearly ready to bloom, and then a gentle heat will help to expand them, and, besides, is necessary for the due development of their fragrance.

The soil I use is loam, with nearly an equal amount of peat, and a liberal addition of sand. By repotting at different times the season of their bloom may be prolonged, and the *New Plant and Bulb Company* say they may be planted out in the open, like *Gladia*, to flower in the summer or autumn. *M. T.*

house since the beginning of winter, the little plants grew apace; a little while ago several threw up bloom-stalks, and yesterday (Jan. 27, 1882) the flowers which I send you opened. The blooms coming on appear to be larger and fuller than the one I send, and all would probably have done better if they had not been over-crowded in the pot.

The nomenclature of *Freesia* bids fair to lead to some confusion. Mr. Baker, who in his *Synopsis* admitted two species, *refracta* and *Leichlinii*, now allows only one, and defends his position by referring to the collection in the Kew Herbarium, where may be seen a large number of specimens differing widely in the size of the plant, in the width of the leaves, in the colour, in the size and form of the flower; but, nevertheless, as far as can be judged from the dried plants, passing almost insensibly one into another. When, however, we come to deal with the living plants we shall find, I imagine, several distinct forms which for garden purposes will have to be distinguished by

CYCLAMEN COMPLANATUM.—The rich purplish-crimson blossoms of this little harbinger of spring form a striking and pleasing feature on the rock-work in the nurseries of Messrs. J. Backhouse & Son, York. It is by no means difficult to grow, as it thrives in any well-drained garden soil in a lightly shaded position.

Orchid Notes and Cleanings.

WORK IN THE HOUSES.—The season has nearly arrived when many insect pests that have remained in abeyance during the winter will begin to show signs of greater vitality, and as cleanliness and freedom from these pests are necessary conditions in growing Orchids successfully, I would urge that the plants be gone over and cleaned without delay. We are now going over our East Indian-house, as the greater heat in this division generally brings insect life into existence earlier than in the cooler houses. Every plant will be carefully sponged over, and a soft brush will be necessary to get into the axils of the leaves. We have no liking for any kind of insecticide in the water when cleaning Orchids, but rely on pure soft water slightly warmed. At the same time the house will be thoroughly cleaned down, and the beds of cocoa-fibre which we always keep in the house for giving off a regular supply of moisture will be turned and replenished, adding a surfacing of fresh fibre before re-arranging the plants. Where ants and cockroaches abound efforts should be made when cleaning the house to reduce their number. As soon as the earliest *Phalenopsis* in this house are cut it will benefit the plants to keep them slightly drier at the roots; this will tend to give greater firmness to the foliage, and will keep the plants from making growth too early, as in my experience I have never found foliage made on these plants during early spring or late autumn ever stand like that made under a mid-summer sky. In the Mexican-house the most useful plants at present are *Lelia anceps* and *L. anceps Dawsoni*. Other *Lelias* in this house that will now be fit for repotting are *L. allida*, *L. harpophylla*, *L. autumnalis*, and *L. autumnalis atrovirens*. These we grow in pots in preference to blocks, but are careful not to use too much material about their roots, as few Orchids are more impatient than these in having their roots smothered up with compost. As soon as growth commences they should have a light position accorded them with a fairly moist atmosphere, watering them sparingly for the present. *Plumna fragrans*, now flowering, is a useful plant at this season, and as soon as the flowers are cut it should be potted. We use a mixture of fibry peat and sphagnum in equal parts when putting it, and keep the roots moist at all times. During summer the cool-house will suit this plant best. *Cattleya Warneri* and *C. maxima* are now in a fit state for repotting or top-dressing, and should be seen to early, before the growths get much advanced. *Cattleya Mossii*, *C. Mendelli*, and some others will need to be kept dry at present, both at the root and atmospherically, otherwise they are apt to start into growth, which would prevent them flowering at their proper season. *Cattleya chrysensis*, *C. Warszewiczii delicata*, and *C. Trinoe*, are pushing up their flowers, and are kept moderately moist at the root. There will not be much growth going on at present among the *Dendrobies*. Where there is a good stock of *D. nobile*, *D. Wardianum*, and other early bloomers, the object now should be to treat them so as to get a long succession of flowers. In the cool-house *Odontoglossum Rossi majus* and *O. bicolorense* need potting, also *Masdevallia Daviesii* and *M. tovarensis*: the latter we have kept in the cool-house this winter, and the plants are in better health than we have ever had them when kept in the Cattleya-house. Where the *Calanthes* have been scattered through the warm houses during their flowering season, which will now be nearly over, they should all be got together and put into a temperature of about 65°, and be kept dry for about six weeks or two months. *J. Roberts, Gunnesbury.*

EFFECTS OF LONDON FOG ON ORCHIDS.—Those who happen to have resided in any part of the kingdom much subject to fogs, need not be told that these visitations are by no means desirable, even in localities where there is nothing in the atmosphere that is of an objectionable nature; but where, as in the neighbourhood of London, the thick vapour is charged to the full with sulphurous exhalations from hundreds of thousands of chimneys large and small, the injurious effects on both animal and vegetable life are easily seen. Amongst plants that invariably show by the flowers the presence of fogs are some Orchids, which, even with tightly closed

ventilators and a genial atmosphere kept up by the presence of artificial warmth, seldom fail to show when a visitation of fog has occurred. Such species as possess flowers of a soft fleshy texture suffer much more than others, amongst these *Phalenopsis*, *Calanthes* of the *vestita* section, and *Angreecum sesquipedale* are particularly liable to injury from it; the partially developed flowers of *Phalenopsis* and *Angreecum* turn yellow and advance no further; whilst the open blooms, as well as those that are advancing in the *Calanthes*, die. The way in which it kills a portion of the unexpanded flowers of the *Angreecum* is singular and unaccountable; in some cases all on one spike which a plant bears will be destroyed, another spike on the same plant wholly escaping; in other instances a single flower will be killed, whilst another on the same spike will be uninjured. A recent opportunity of seeing the plants in one of our nurseries verified this. Amongst some three dozen examples of this fine winter-flowering Orchid, having from two to three spikes each, some of them being unusually fine varieties, some had altogether escaped, but the majority had partially suffered, and a few had all the flowers killed. Not so with *Phalenopsis*; in the long house, where quantities of beautiful plants in splendid health are located, bristling with their arched spikes, many had all the flowers killed that were advanced further than the bud state. On the *Calanthes* the open flowers hung soft and flacid, just as if they had been subject to frost; difference in position near or further from the roof appears to make no difference; but with *Phalenopsis* the buds that are only just formed suffer comparatively little and go on. There is a grain of consolation however in the loss, for it is well known to cultivators that there are few Orchids whose strength is so much taxed by blooming as *Phalenopsis*, and when the immature flowers are thus stricken before they have drawn to the full from the plants, the latter are so much less weakened. It would be interesting to know how the flowers of Orchids, particularly the species here noticed, are affected by fog in localities where it is not charged with smoky vapours, to the presence of which the destructive effects are generally supposed to be due.

THE PHALENOPSIS AT HENHAM HALL.—These are now (the middle of January) in full bloom. They consist of about fifty plants of *P. anabilis*, *P. grandiflora*, and *P. Schilleriana*. They are suspended from the roof of a small house, and almost fill the front of it. On the front shelf there is a row of *Calanthe Veitchii*, also in full flower; the spikes of the latter reach up to within a short distance of the drooping spikes of the *Phalenopsis*. The varieties of the latter being also mixed together, the effect of the whole is rich and chaste beyond compare, and must be seen to be thoroughly appreciated. The *P. anabilis* and *P. grandiflora* were in full bloom at the time of my visit, while several of the *P. Schilleriana*, which is later, were also in flower, the whole furnishing a feast of beauty and fragrance such as is seldom met with. Lady Stralbrooke is justly proud of her *Phalenopsis*, in which she takes a very lively personal interest. Mr. Eden, her ladyship's gardener, pointed out to me a fine healthy plant with two fine leaves, which was obtained from surrounding a bud on a last year's flower-stem with damp moss; shoots were developed, and this fine plant was the result. It must, however, be added, that other buds treated in the same way refused to form plants. But as success is now proved to be possible, every promising bud on the strong flowering shoots are to be enticed by every available means to follow the example set them by this young plant, which promises soon to equal the finest specimens in the house. There are many other plants and features of interest at Henham, but the Orchids are so far superior to all else at present that it may suffice to chronicle such a feat of *Phalenopsis* as is seldom or never seen in the provinces. *D. T. F.*

CATTELEYA CRINA.—This charming Mexican Orchid is rarely seen in better order than it is in the hands of Mr. Hinnell, at Anglesea House, Surliton, where it is suspended from a wire in a house kept at a temperature higher than Mexican Orchids appear to like generally. The plant has made fine buds, and is showing flower-spikes accordingly. All who grow Orchids, and who value their rarity, should possess this beautiful yellow-scented variety, if for its fragrance alone. *W. B.*

The Hardy Fruit Garden.

MANURING OF BORDERS and quarters devoted to the cultivation of fruits must not longer be delayed, and if much of such work yet remains to be done it will be well to set about it at once, rather than to wait for the uncertain chances of severe weather setting in. To prevent injury to walks, the surface of which is soft from continued damp weather, it may be necessary to use planks to wheel upon, which will be the means of saving much labour in putting the paths right again. For passing over loose ground, and for protecting the roots of shallow-planted fruit trees, a like resource must be adopted. Use manure of as short and thoroughly decomposed a nature as possible for fruit trees, both as being more speedily useable by the roots, and as being more easily worked in where the roots approach near the surface of the ground. Any droppings that have been accumulated in excess of the requirements of the Mushroom-beds will be amongst the best of materials. The product of the waste vegetable heap when thoroughly rotten, the cleanings from poultry-houses, and any wood-ashes that can be produced by the burning of prunings, weeds, and rubbish of all descriptions, may all be used with good results and comparative ease in application.

TANKS for the reception of liquid-manure from the stables or cow-houses and for house sewage are useful adjuncts to the garden; especially is this the case where the supply of ordinary farmyard manure is limited in quantity, and for use on fruit borders, where it is considered unadvisable to fork in much manure, because of the number of surface roots, and where continued surface-dressings may be raising the borders higher than is desirable. Large quantities of such liquid manure may be put upon fruit quarters at this season, as it is generally much diluted from the rainfall where the water from buildings and the rain running from the surface of yards, &c., is permitted to mingle with the other drainage. Heaps of loam or compost in stock may be thoroughly enriched by being frequently favoured with a supply when available, which is seldom the case after the growing crops in other departments make heavy demands upon this stimulating food. Where no such tank accommodation exists—or where it is not adequate for the storage of the supply available, and to the demands upon it, it may be well to see if tanks cannot be had by trying to spare a little labour from the garden for excavation, cutting drains, &c., which will greatly reduce the direct outlay incurred in their formation. Where the subsoil is a retentive clay tanks may be constructed at a trifling expense, as a 4-inch brick wall, set in cement, will generally be found sufficient for the sides, provided they are well puddled around; but on light soils and on stony ground two such walls may require to be built with a half-inch cavity between, which can be filled with cement.

ARRANGERS OF WORK should now be looked to, and brought up as soon as possible. Where, from pressure of work in other departments, or interruption of any description, any necessary planting of fresh trees, root-pruning of those requiring this assistance, removal of useless specimens, and trenching and enrichment of stations remain undone, use the utmost expedition to recover lost ground. Also where the needed staking and mulching of newly planted trees has been suffered to remain unattended to, and where any pruning, tying, or nailing, is further behind than is advisable with lengthening days and increased work at hand, it will be well to push on such operations at once. Trees that have yet to be lifted in order to check excessive root-action must now be raised with even greater care than was necessary in the autumn, avoiding all unnecessary mutilation, carefully preserving all the smaller roots, and duly trimming with a clean cut any root that is found necessary to remove in lifting the tree. Careful lifting is usually all that is necessary to insure fruitful growth by preventing roots from descending into unsuitable subsoil, or by raising the roots nearer the surface, and more within the sun's influence, on cold soil while root-pruning as sometimes performed is rather a barbarous process, which frequently gives too great a check to the trees operated upon—especially to old ones, and

which it requires great strength of constitution to withstand.

CUTTINGS of bush fruits may yet be put in, choosing straight vigorous growths, which may be cut to a foot in length, removing all but the selected number of buds at the top—except in black Currants, and insert deeply and firmly, working in a little sand and leaf-soil where the ground is heavy. *Ralph Crossling, Castle Gardens, St. Fagan's.*

APPLE ARCADES.—There are so many ways of improving gardens and of making them remunerative as well as attractive, that it is by no means certain whether those who complain of circumscribed space make the most of what they possess. One way of utilising space would be to erect an arcade for training fruit trees upon, over the main walks of our gardens. At Esler Lodge, Surrey, the seat of J. F. Eastwood, Esq., there is one of these arcades thrown over the main walk of the kitchen and fruit garden, which is as profitable as it is ornamental. Apart altogether from the beauty of the arcade when the trees are in flower, or the refreshing shelter it provides from the scorching sun of summer when it is thickly covered with leaves, it produces a never-failing supply of Apples without encroaching upon the space of the garden. In autumn, too, the rosy-cheeked fruits peeping out from among the green leaves form a very pretty sight. The arcade is made of strong iron wire, and is from 9 to 10 feet in height, covering a walk from 8 to 10 feet wide. A strong iron arch is thrown over the walk at either end, into which wires 1½ inch in circumference are fastened and run lengthwise at 2 feet apart. Wires of the same strength are then shaped arch-fashion and placed under these at 12 inches apart, and fastened to them by smaller wires. The arcade has been erected over fourteen years, and the trees, which are very healthy, are swarming with fruiting-spurs. The varieties are Ribston Pippin, Emperor Alexander, Waltham Abbey Seedling, Lemon Pippin, Duke of Devonshire, Hanwell Souring, Farleigh Pippin, Newtown Pippin, Bedfordshire Foundling, Northern Greening, Hubbard's Pearmain, Rosemary Russet, Boston Russet, Keswick Codlin, Blenheim Orange, London Pippin, Kerry Pippin, Wellington, Cornish Aromatic, Easter Pippin, and Pennington Seedling. *W. H.*

MORELLO CHERRIES ON BOARD WALLS.—The Morello Cherry is probably the most productive fruit grown in British gardens. It is a never-failing cropper, and fruits so freely upon north walls that there is hardly one in the kingdom that is not stocked in greater part with them. Owners of small gardens who have no brick walls perhaps never think that what the rich landed proprietor obtains from the face of a pile of bricks they may as readily obtain from a "board wall." A board fence 6 to 8 feet high is not an expensive method of enclosing a plot of ground, and if the boards are utilised as a wall upon which to train fruit trees the proprietor will find by-and-bye that he not only has his boards for nothing but a stock of fruit to the bargain. *H.*

BELLE DE SEPTEMBRE PLUM.—This is one of the best varieties to plant as an orchard tree, and has the merit of being an annual bearer. The fruits are egg-shaped and the colour a reddish-purple when nearly ripe. It is a free cropper and an admirable kitchen Plum in its season. *W. H.*

Grapes and Vineries.

THE Vines in the earliest house will now be in bloom or ready for thinning, according to the freedom with which they broke. Where ready for thinning be careful not to commence before the berries have been set a few days, so that those which have taken the lead can be left, and the smaller ones be taken out. Be careful not to touch the bunches in the operation, and go over them a second time after a few days to take out any small or deformed berries. After the thinning is completed, give the border a thorough soaking with tepid manure-water, at a temperature of 85°; also fill the evaporating troughs with weak manure-water. Still keep the night temperature at 65°, with a rise of 10° by day. Admit air early on all favourable occasions, gradually increasing it as the temperature rises. Close early in the afternoon, and damp the paths and borders with tepid water several times daily, according to the state of the weather

outside. Keep those that are in bloom in a drier atmosphere until they are set, tapping the rods several times daily to disperse the pollen. Where fermenting material is used on outside borders, add fresh dung and leaves as the heat declines, to keep the temperature at 75° to 80°. Succession-houses of Hamburghs started early in the month will now be breaking, and can have a night temperature of 55°, with a rise of 10° by day, steadily increasing the temperature as the growth advances. Keep the fermenting material as advised in previous Calendars, and let the rods be well syringed until the bunches can be seen, when it may be discontinued. Muscats started early in the month will now be on the move, and when they commence breaking they should be kept at a night temperature of 60°, with a rise of 10° by day, increasing the temperature as growth advances about 5° in the next two weeks. If the Vines were tied down in a horizontal position to induce them to break regularly they had better be tied up as soon as they break, as sometimes the shoots snap off in the operation. Any rods that are not breaking well must be kept suspended in a horizontal position over the fermenting materials until they do break. Keep the rods well syringed with tepid water as given when the temperature reaches 70° on the back ventilators, and close early in the afternoon. The present is a good time to start Golden Queen, if it is grown along with Black Hamburghs, and is wanted for exhibition in the early part of August, as it takes a long time to finish off a rich golden colour. I find it succeeds well in the same temperature as Black Hamburgh if started now, but if started along with late Hamburghs it does not finish, and is not nearly so fine in the berry. It does better here grafted on Foster's Seedling than on its own roots. All late Grapes if not already cut from the Vines must be removed at once, for not only will the Grapes keep better bottled in the fruit-room, but it is of the utmost importance to give the Vines all the rest possible if they are to be started early in March, and all late Grapes should be started by that time. Ours have all been cut and bottled since January 7, and are keeping well. As soon as possible after the Grapes are cut frame the houses and dress the cuts with styptic. If there is any chance of bleeding throw the house open a few days before pruning. Pot Vines as soon as they are thinned must have liberal supplies of tepid manure-water a few degrees warmer than the roots, and top-dress them as the roots appear on the surface. Cut-back Vines intended for fruiters next year can be put in heat, and when they have made a few inches of growth shake them out and report them in rich rough compost, and put 9 inches in diameter, plunge in a gentle bottom-heat, and keep them near the glass. Keep the Grape-room as near 45° as possible, and the atmosphere dry: fill the bottles with pure soft water when necessary. *Joshua Atkins, Looking's Garden, Hants.*

The Pine Stove.

THE time for spring potting is fast approaching, so that those preparations which can be made, may now be done with advantage. Examine carefully all the plants that are to be shifted next month and give all water that require it so that when they are shaken out the balls will not be too dry. Any that are under a drip should be moved, and if any have got too wet from any cause they should be allowed to get dry by the time they are shifted. The pots that will be required should be looked out, and those that are cracked may be put on one side for plunging, but they should be precisely the same size as the pots used for fruiting plants. Break up the loam in pieces about the size of hen's eggs, and where time allows it, it is best done by hand, as the spade or any other sharp instrument is apt to cut and damage the fibre. In making a deal of waste, as the small portions have to be thrown on one side. Put the loam in a dry warm shed, and mix the bones and charcoal with it when the potting is done. Where good charcoal is not available it is better to get a sack or two from places where it is thoroughly prepared. Good bones must also be in readiness; those that have been stored a little time are preferable to new bones, as they are apt to ferment or breed maggots. A quantity of dry fresh soil should be kept in reserve for putting over the cracks, and if any wireworms are observed in the loam throw a little soil over it as it is turned over. The materials for forming new beds should also be got in readiness, such as Oak leaves and tan; the latter is best used for two or three weeks in a dry shed before using, so the germs of fungus will exhaust themselves, and the danger may be anticipated from that cause. A good sawdust is an excellent material for plunging plants into, and may be used over leaves or other fermenting materials. Also those plants starting a little lignum-mansure, also those in various stages of swelling. Do not apply it too strong, but a little may be given every time they are watered. *D. Wilson, Carr Hill, South Milton, Devon.*

The Flower Garden.

GRASS LAWNS are in very fine condition this season—if anything rather too luxuriant, but this is a very good fault, and will be corrected by-and-bye. In the meantime, as worm-casts are abundant, they should be frequently distributed over the surface with a long flexible pole, where, if left to the influence of the weather, they will act as a fertiliser, and strengthen the sward. To help this the roller should be occasionally passed over the surface when the soil so distributed does not cling to the roller. Gravel walks, will require frequent attention as to rolling, not only to consolidate them after heavy rains and frosts, to ensure comfort in walking, but to give the lawns a well-kept appearance. For a like purpose sweeping over the surface may be occasionally resorted to when the untidiness is so apparent as to render it absolutely necessary, but I am no advocate for frequently sweeping over grass lawns during the winter months, as by the influence of the weather and various other causes much vegetable *effluvia*, becomes distributed over the surface, which if rolled in instead of being swept off helps to strengthen the grass, and helps it to sustain the exhaustive process attendant upon the frequent mowings in the summer. This is also an excellent time to apply good dressings of wood-ashes to any weak places on the lawns, as it is also for removing all inequalities in the surface through sinking, which cannot be remedied too soon now, so that the turf may become re-established before the drying winds of spring set in. Attention to these matters now will probably save much labour when the season is more advanced.

PLANTING.—As long as the weather continues open this operation may be carried on with success, although as a rule the latter end of October and the month of November is by far the most eligible time for the purpose. We are, however, so frequently the slaves of circumstances as to be compelled to resort to spring planting to save time, and must be willing to take the chance of obtaining less growth, so that the trees and shrubs may become established in the present year. The season has been eminently a favourable one for all who have had extensive works of the kind in hand, and there has been no particular need to hurry over the necessary ground-work too fast. A thorough drainage is the first great requisite to ensure success, and the next that the whole of the ground intended to be planted should be thoroughly trenched to the depth of 2 feet; with such good preparation the chances of failure are reduced to a minimum, and the after-progress of the trees and shrubs will amply compensate for the extra labour of preparation. The same remarks will apply with even greater force to the planting of Roses, which should be brought to a close as soon as possible, and here also the work of preparation is most important; the ground should be thoroughly broken up over 2 feet deep, and whatever manure is used should be well decomposed and thoroughly mixed up within about a foot of the surface. A mere mulching and digging in is not sufficient for such borders; the manure should be well incorporated with the soil, not turned in in lumps. The planting of deciduous trees should be completed as soon as possible. As a rule, these are not so freely used in conjunction with evergreens as they should be. No place of any pretension should be without a selection of the best sorts, as they possess sufficient character in themselves to render them desirable in the summer, but in the autumn they greatly enhance the beauty of the plantations by their varied and striking colours. Among them may be specified Virginia Larch, the Broad-leaved American Oak, Fraxinus pedunculata, the Tulip-tree, Mountain Ash, the Catalpa, the White Bean, or Ficus Arta, very striking in combination; the Acer Negundo variegatum, crimson Thorns, and the Red-leaved American Maple.

ROCKERY.—There is not much moving in this department at present. Some dark violet ones of Heliolepis or Chinensis Rose have been in flower lately for some time. All extraneous matter must be constantly removed so that the beds may show evidences of care—always a pleasing feature, nowhere more desirable than in this department. The regularity and reducing the plants may be left for a time, until vegetation is more advanced, but the foundation of new work must be vigorously prosecuted so that the beds at present may be ready for early spring planting. *John Cox, Redleaf.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan 19	Scale of Lily Bulbs, Tulips, and Calliots from Sec'd of the Auction Mart, by Prothon & Morris, 10, Abchurch Lane, London, E.C. 4.
WEDNESDAY,	1-19-2	Scale of Improved Orchid, at Stevens' Rooms.
THURSDAY,	1-19-2	Meeting of Junior Society, at 8 1/2 W. Scale of Potted-orchids, at Stevens' Rooms.
SATURDAY,	1-19-1	Scale of Hardy Plants and Bulbs, at Stevens' Rooms.

LILIES OF THE VALLEY, Spineas, bulbs, and other plants are now forced on such an extensive scale that the best and simplest modes of urging them into bloom become matters of pressing importance. It is well at the outset to distinguish between plants grown for their flowers only, and those in which the present beauty and future health of the entire plant are involved. It may be wise to adopt express modes of forwarding the former classes of plants, that it would be the height of imprudence to apply to the latter. For example, where the welfare of the whole plant is concerned, it should be more or less fully exposed to the light during its entire period of growth. But with plants merely or chiefly grown for their flowers only, clear light may hinder rather than help their speedy development. It is found in practice that most bulbs and such plants as Lilies of the Valley make most progress in the dark. The absence of light during their earlier stages neither unduly weakens the flower stems nor diminishes the size of flowers; the gentle drawing which it affords, on the contrary, improves the style and character of the flowers. In the case of Lilies of the Valley and Hyacinths, for example, considerable length of stem improves the character of the spikes and affords the individual flowers more room for their fuller and more perfect development. It is no uncommon thing to see Hyacinths in glasses often grown in the light from the first with such stumps—on crowded spikes—as to resemble pyramidal Cockscombs rather than perfect Hyacinths. The same dwarfed characters are often seen among Lilies of the Valley. The surest remedy against such stunted deformities is to grow them a fortnight or so in the dark after the plants are introduced into heat.

This is quite a different matter to the plunging of bulbs and other plants in cinder-ashes, &c., after potting. Thus treated and placed in a cool spot a crop of roots is pretty certain. This is of the utmost importance to the future well-doing of the plants. But a crop of roots and a fat crown may often be found in unison without resulting in stately stems and perfect flowers. In this may be said to be the germ of perfection; but supposing these germs to be suddenly exposed to the light, as they often are, the chances are that the horizontal may outvie the vertical growth, to the spoiling of the size and symmetry of the spike. By keeping them in total or semi-darkness for a fortnight or so after their introduction into heat, the stems or spikes are sent upwards with sufficient force to afford space for the full development of all the flowers. Not only this, Lilies of the Valley are doubly graceful when a considerable space intervenes between each two of their bells. It also makes all the difference for bouquets and other decorative purposes, whether the stems measure 4 inches, 9 inches, or over a foot in length. With the stalks of the plant as with those of Violets, it may almost be said the longer the better within certain limit.

This system of partially growing such plants in the dark not only improves, but saves more than half the time usually bestowed on the forcing of them. Where the flowers alone are valued, even the previous rooting of Lilies of the Valley may be safely dispensed with. The embryo flowers are already in the crowns, and

only need the sharp stimulus of heat and moisture to be developed. Strong crowns do not seem to suffer by being placed in a temperature of 70° to 80° at once. This, with a fair amount of humidity, wakens up the crowns at once, and within a few weeks they are fit to gather.

They may also be kept in darkness, as the French do their Lilies, till they are in full flower. The chief differences between these and Lilies of the Valley wholly or partially grown in the light is that the entire stem is almost as white as the flowers. They seem almost equally fragrant, however, and for wedding bouquets these ivory-looking Lilies are admirable. But they are less durable and more easily tarnished than those inured to light for a few days after reaching nearly their full height. The latter soon gather strength, and hardly differ excepting in greater elegance and longer stems than those grown in the ordinary manner. Of course the darkness blanches the leaves somewhat. But when it is needful thus to hurry on Lilies of the Valley in the dark, it is easy to place a few pots or boxes of smaller crowns in the light to furnish verdure for the forced flowers. Another advantage of this semi-dark method of treating such plants is, that it enables many to force them that could not otherwise do so—in warm cellars, in hot corners or cupboards in the kitchen, or in a close stable or cow-house where a heap of manure may thus be impressed into the production of some of the sweetest bulbs and other flowers.

Labour may also thus be saved, as well as space economised. Bulbs grown in the dark may be plunged in hot moist manure, and need no water or other attention for several weeks. The rate of growth is also more rapid. Lilies of the Valley may thus be rushed into flower in a fortnight or three weeks. This shortening of the period of production is a matter of the greatest commercial importance; for in these days of keen competition the race is to the swift and the battle to the strong; and those who can produce the most and best flowers, fruit, and vegetables, in the least time, and at the least cost, are those who win fame or fortune. Anything here advanced must not be understood as in any way underrating the superlative importance of light to the well-being of plants. On the contrary, the very possibility of forcing such plants in the dark arises from the potency of the light of the previous summer, which did its work so thoroughly as to leave the flowers so perfect in crown or bulb that heat and moisture, either with or without more light, sufficed to develop them sufficiently for our purposes.

— **TRICHOCHERUM PFAVIL**.—This pretty little Orchid was exhibited at the last meeting of the Floral Committee by Messrs. SANDER & Co., of St. Alban's, who kindly placed the plant in our artist's hands for illustration, and the result of his work is seen in fig. 21, on the opposite page. Prof. REICHENBACH described it, at p. 70 of our last volume, as a new species discovered in Central America, by a new Swiss collector, Herr PFAVIL. "The sepals and petals are spatulate, blunt, half brown, half white. The lip is cuneate, flabellate, bilobed, crisp, white with a red blotch on the middle of the stalk, which gives it a very elegant appearance. There are two acuminate spreading teeth on the stalk. The rounded oblong wings of the column have a border of brown spots."

— **THE FEMALE FLOWERS OF THE CONIFERÆ**. Dr. A. W. EICHLER is the latest contributor to the copious literature on this subject, already enriched by him on previous occasions. He finds that the Cycadææ, Conifereæ, and Gnetaeæ are true gymnosperms. In his concluding paragraph the author states that the principal results of his investigations are not new, but their value lies in the fact that they are confirmatory of a great deal that is merely

shadowed forth in SACH'S *Lehrbuch*. The paper is illustrated.

— **CENSUS OF THE FLORA OF PRUSSIA**.—Students of the vegetation of the flora of Prussia in the *Königsberger Gartenschau Zeitung* for October, 1881, by Dr. C. SAINE. It is in substance a criticism of KLINGGRÄF'S figures that appeared in the *Botanisches Centralblatt*. SAINE gives the following statistics:—Flowering plants, 1189 species; Ferns, 23 species; mosses, 293 species; Liverworts, 71 species, &c.

— **FLORISTS' SOCIETIES**.—The annual general meeting of the members of the National Auricula (Northern Section), Royal National Tulip, and National Carnation and Picotee (Northern Section) Societies, will be held at the "Old Bull's Head" (off the Market Place), Manchester, on Wednesday, February 1, at 3 o'clock P.M., to arrange the dates of this year's exhibitions, to decide upon the schedule of prizes, the plan of judging, and any other matter and work connected with the management of these societies.

— **THE OLD DOUBLE WHITE CAMELLIA**.—A fine specimen of this in the Camellia-house at Somerley Park, Kingwood, is now furnishing blossoms of exquisite shape, while *Donkelaar* and *imbricata alba* are doing like good service. These are three good and useful Camellias for a gardener to grow for cutting from, and despite the many new varieties introduced, the former furnishes flowers of rare form and symmetry.

— **GLOXINIAS IN JANUARY**.—Much in the way of improvement has been accomplished by florists among Gloxinias of late years, and there is probably no more useful or attractive class of plants in cultivation that may be possessed by everybody who grows plants at all. Formerly one, or at most two batches of Gloxinias were considered ample to flower in one season, but now it is nothing uncommon to see them in flower from March to November. It is, however, a trifle out of the common to see Gloxinias in flower in January. Mr. BECKETT, gardener to F. H. BRYANT, Esq., Glencain, Subitton Hill, is the successful cultivator, and it is needless to say what a fine show they make at this season, their bright colours being most effective in forming front rows amongst green Ferns and mosses in the plant-stove. The plants were raised from seeds sown last March, and the portion now in flower were left in the seed-pan in a neglected state through the summer, and not potted up until late in the season. Of course the natural inference to be drawn from these facts is that by making two or three sowings in a season Gloxinias may be had in flower all the year round.

— **GRAND NATIONAL DAHLIA SHOW**.—It has now been definitively settled that this shall take place at the Crystal Palace, Sydenham, on September 8 and 9 next. The Directors of the Crystal Palace Company will give a handsome sum in aid of the prize fund, but to enable the committee to issue a really liberal schedule, such as will ensure a truly great show, by inviting Dahlias of every class, and by holding out proper encouragement to all growers, both those with limited and those with extended opportunities, a considerable sum will have to be raised; and it is hoped that all who favour the project will send their subscriptions in good time to the Hon. Secretary, Mr. G. SMITH, New Villa, Hedge Lane, Edmonton.

— **THE AMERICAN "GARDEN"**.—This journal, heretofore published quarterly, is to be issued in future monthly. Paper and typography are excellent, and the contents practical and diversified. A coloured plate, representing the Golden Pocklington Grape, is given with the present number.

— **STRANGE DWELLINGS**.—Messrs. LONGMAN have issued, in their sixpenny *Sunbeam* series, a popular edition of the Rev. J. G. Wood's *Strange Dwellings*, abridged from the larger work of the same author, entitled *Homes Without Hands*. It is an interesting book, and one that would be perused with interest in many a garden library. Its low price is also a great recommendation.

— **THE "ILLUSTRATED HORTICOLE"** for January contains coloured figures of a new Aroid, *Alocasia Putzeysii*, the Nectarine Peach, *Hibiscus*

rosa sinensis var. *Lucien Linden*, with the double flowers of a red colour banded and striped with white. We shall note these plants again under the heading of "Plant Portraits." The general editorship is confided to M. RODIGAS—a guarantee of accuracy.

much sooner than usual, unless some kind of rule regulates market procedure by which things put in appearance at certain dates. But if the mild weather has proved favourable to the development of market garden crops, it has also greatly encouraged the

spring, the moving influences of which will soon be felt.

— HAWTHORNS IN FLOWER.—Mr. COOLING, of Derby, sends us a spray of Hawthorn with the

FIG. 21.—TRICHOCENTRUM PEAVII.

— SPRING ONIONS.—It must be years since the large breadths of Spring Onions seen in the big market gardens about London looked so forward and well as they do at the present time. They have not ceased growing all the autumn and winter, and it would not be difficult to find many fit for market. Should the wintry weather that cannot be much longer delayed (if it is to come at all) not be too severe, the pulling of these Onions will commence

growth of weeds, and that without anything like a serious check. So luxuriantly have these flourished that hoeing has proved of but little value unless the weeds were afterwards picked up by hand. They are carted to the manure-heap, or at once buried in the ground where rough trenching is carried on. We may yet experience very severe weather, but present appearances point to the probability that there will be an abundance of market garden crops in the

flowers developed almost up to the opening stage, gathered from a tree wholly in this condition growing on cold clay!

— MANDRAGORA AUTUMNALIS.—Mr. ELLACOMBE sends us flowers of this curious and interesting plant which he says has been in flower in his garden for the last six weeks. Its dwarf habit, tufted foliage, and its groups of light violet funnel-shaped

flowers, each of which is more than an inch in diameter, and raised on a leafless hairy stalk, render it very attractive apart from the singular interest attaching to the plant. Unlike *M. vernalis*, this species does not usually produce fruit in this country.

— **LINNEAN SOCIETY.**—At the meeting to be held on Thursday, February 2, at 8 P.M., the following papers will be read:—1. "Note on the Medical Use of *Melicope uncinata*;" by OTTO TEPPER. 2. "Remarks on Elephant Flukes;" by Major-General BENSON. 3. "Botanical Sketch in Connection with the Geological Features of New South Wales;" by ROBERT D. FITZGERALD. 4. "Observations on Animal Intelligence;" by OTTO TEPPER.

— **FORESTRY BULLETIN.**—Under this title the American Census Department has published a series of maps of various States of the Union, coloured to show the distribution and extent of the principal timber trees, together with tables showing the estimated amount of "merchable" timber in each county at the end of May, 1831, and the quantity cut during the year. The maps are beautifully executed, and the "get up," as in so many of the American publications, remarkable for neatness and finish. Taking the sheets before us we find that in Texas the principal Pines are *Pinus australis*, *P. mitis*, and *P. taeda*; in Florida, *P. australis*; in Alabama and in Mississippi, *P. mitis* and *P. australis*; in Minnesota, *P. Strobus*.

— **FLOWERING OF THE HAZEL.**—Finding catkins and female flowers of the Hazel (*Corylus avellana*) fully open on the 20th inst., we were led to search for information as to the earliest date at which it had been recorded to flower. In the calendar given in WHITE'S *Scelera*, January 3 is given as the earliest date, March 11 as the latest, in the counties of Hampshire and Sussex respectively. The particular years are not mentioned, so that we cannot say anything about the character of the particular seasons, but in MISS MOLESWORTH'S *Cobham Journals*, edited by MISS ORMEROD, we find more precise indications, though still very few in number. From these data it appears that the average date of flowering of the Hazel for seven years, in the county of Surrey, was February 8. The earliest date recorded by MISS MOLESWORTH was January 30, 1832, the latest, February 28, 1830. The winter of 1831-32, we learn from the same record, was colder than the average; but what is more to the purpose is that the autumn of 1831 was specially warm, the temperature having been in excess of the average in July, August, October, and November. In 1830, on the other hand, the temperature of January and February was below the average. And still more markedly deficient was the temperature of the autumn of 1829—July, August, September, October, November, and December; so that the late-flowering of the Hazel in the succeeding spring appears to be well accounted for in that particular locality.

— **THE POTATO TRADE.**—The *Times* states that Potatoes are still being shipped from the Clyde and some other ports to New York. There must be a considerable dearth of Potatoes in the United States this season, as the following facts will show:—Scotch Regents are sold wholesale in our markets at from 70s. to 80s. a ton, and Champions at about 50s. per ton. They are thus delivered free on board ship. The freight and the ordinary charges amount to 25s. a ton; but the Customs' dues in landing at New York are nearly 25s. a ton. The prices of Champions in New York are thus double what they are in our markets.

— **LIBONIA FLORIBUNDA.**—The common practice of growing this plant in a small state is probably owing to the fact that many people are not aware that the older the plant is the better it flowers—at least, up to six or seven years old. Young plants grown from cuttings in one season, or two-year-old plants, require a lot of spiring, and unless they are in the hands of a practised plantsman seldom yield more than a few flowering points which hardly pay the cultivator for his labour. Young plants that are planted out in rich compost, or that are over-potted, are seldom satisfactory, because the shoots are not sufficiently matured to yield flowers unless in very favourable seasons. But plants from three to six years old, grown in pots the year through, will make handsome bushes, which will flower at this season and

onwards from the tip of the shoot down to the rim of the pot. It is, indeed, a wonder why plant exhibitors do not take to growing the plant for the spring exhibitions. It requires no staking, and a specimen from 4 to 5 feet through would be no mean object at an exhibition. Those, therefore, who have old plants should not throw them away after flowering, but cut them down at the proper time, and after they have started into growth shake them out, repot, and grow on for another season. During the summer and autumn the plants should be grown in the full blaze of the sun, in order to have the shoots nearly an amber colour in the autumn, which is a sure indication of subsequent success.

— **RETIREMENT OF MR. THOMAS MOORE.**—We have already alluded to this matter, and should hardly have done so again were it not for the receipt of a letter from Mr. STEVENS, of Trentham, in which he recalls the numerous claims which MR. MOORE has on the gratitude and respect of the gardening body—not so much for his official services, but for kindly disinterested work and generous help which cannot be measured by ordinary standards. Our motives in not printing MR. STEVENS' letter in full will readily be understood.

— **CROCUS BORYI ALBUS.**—How cheerful are these little Crocus flowers in mid-winter! A few days ago it was a welcome sight to us to meet with this rare and pretty species in the York Nurseries. The blossoms are creamy-white with an orange-yellow throat; very dwarf.

— **THE CORRIDOR AT SOUTH BANK, SURBITON.**—The corridor at South Bank, Surbiton, the residence of W. F. BRYANT, Esq., is now one of the most interesting and attractive departments of that neatly kept garden. The arched entrance to the corridor gives you the idea that you are approaching a grotto, so rustic-like is the workmanship and construction of the walls, which are all faced with cork, and planted with Ferns, Begonias, and other suitable plants. Projecting pockets with a plant of *Cuculigo recurvata* dropped in have a fine effect, as also Palms and other fine-foliage plants, which occupy prominent positions. There are creeping plants trailing over the surface of the cork, and *Cestrum* sorts intermixed with dots of the old *Begonia Rex*, which, together with the silver-marked Fern, *Pteris argyrea*, and several of the green *Pteris*, has a very pretty effect. In the centre of the corridor there is a nice group of plants, and the wings of the building on the ground floor are tastefully ornamented with groups of flowering plants, half-moon shape, which gives the interior of the structure a very cheery appearance. Taken altogether the enjoyment to be derived from such an arrangement is a long way in advance of that to be had in the ordinary conservatory, which, from the very nature of things, is formality itself from beginning to end.

— **GLAZING.**—Whilst the market growers, perhaps the most practical of all plant cultivators, have almost universally adopted the practice of glazing their houses without top putties, the nurserymen have been slower to follow their example. Still it is evident that the good results found by the one section of plant-growers is telling on the other; and evidence of this we saw but the other day in the nursery of Messrs. FROMOW & SONS, at Turnham Green, a large number of new span-houses devoted to the growth of Palms, foliage plants, and various things, being glazed entirely without top putties, and the houses are found to be most efficient. Small copper brads, as less subject to atmospheric action, are found very enduring, four being used to secure each of the large panes of glass, the upper two brads serving at once to fix firmly the glass beneath them and to be also a stay to the pane above. The great point in glazing, to get a good grip for the glass, and to prevent drip, is to be liberal in the use of putty in bedding the glass in. When this is well done, and the surplus putty is neatly cleaned out, the glass is securely fixed by means of the brads, and a couple of coats of paint given to the bars, and well worked into the edges of the glass, drip thus becomes almost an impossibility. When repairs are needed—and of course breakages will occur—there is little hacking to do. The brads are drawn, the broken glass taken out, and the bedded putty can soon be removed. The replacing the damaged with new glass is simple, and soon done. As one result of the non-use of top putties moisture does not

lie about the edges of the glass. On the other hand, when there are top putties the expansion of the glass, which is chiefly vertical, in time lifts the putty, and thus leaves a very trifling space into which water may get, and once there serves it to rot the wood; still worse, being there, when frost comes this is frozen, and, expanding, lifts the putty still more, so that it soon cracks in all directions, and finally shells off in lengths. Evils of this kind, and especially of the accumulation of dirt, is avoided where there are no loosened top putties to cause it to accumulate.

— **THE TRADE IN CUT FLOWERS OF HYACINTHS, &c.**—MR. J. H. KRELAG, of Haarlem writes:—"Serious complaints have been made by members of the English horticultural trade that last year, during the flowering period of Hyacinths, Tulips, and other Dutch bulbous and tuberous rooted plants, the English markets were glutted with numerous masses of cut flowers of these plants sent from Holland, whereby the price of English-grown flowers was in many cases so much depreciated that, instead of giving any profit, there was a great loss in this branch of cultivation. Under these circumstances the majority of the Dutch bulb growers and exporters have thought it necessary to interfere, and at a meeting of the General Association for the Promotion of Bulb Cultivation at Haarlem (a society which has nearly 500 members in twelve different sections) resolutions have been passed condemning this branch of trade, because it is considered to damage largely the trade in bulbs. The Society wishes to induce every bulb grower or exporter, member or not member of the Society, to sign a declaration, in which he undertakes:—1. To send out, neither in the interior nor abroad, any cut flowers of Hyacinths, Tulips, Narcissuses, Anemones, Ranunculuses, or Gladioli, except $\frac{1}{4}$, as samples, in cases under 5 kilogramms; and $\frac{1}{2}$ without charge, for exhibition purposes. 2. Neither to sell, nor to give to others, nor to abandon to their disposition any such cut flowers as an article of trade. The signatures to these declarations will be collected through the officers of the sections of the Society.

— **DACTYLIS GLOMERATA VARIEGATA AS AN EDGING.**—Those who have small gardens and desire to have a pretty edging for their walks and an inexpensive one, should use this beautiful variegated grass, which looks fresh at all times and is very ornamental. As an edging for small flower plots it should be popular with cottagers and amateurs who have the effect of their gardens much deteriorated by the use of bricks and the edgings out of all character with a clastic arrangement of flowers.

— **LIFE HISTORY OF A CROCUS AND GEOGRAPHICAL DISTRIBUTION OF THE GENUS.**—At the Linnean Society, Thursday, Jan. 19, MR. GEORGE MAW read a communication on the above subject. The author says that every living part of a Crocus is annually reproduced, and in one sense there is no continuity of life within each organ. The corn tunic is the only permanent record of perennial existence, and even this in the living state lasts but a year. Seated indiscriminately over the corn surface are minute papille, incipient buds on whose ultimate growth the future cycle of life depends. The abundance of roots is directly related to the floriferous character of each species. The new corm is as it were planted into the substance of its parent, which it absorbs. The tunics are homologous with the leaves, and their fibrous reticulations resemble the latter, only as it were, expanded laterally or with wider meshes. Moreover, their ornamental patterns are so varied yet withal well marked that a fragment is often sufficient to determine a species. The leaves of the majority appear with the flower, but in a few autumnal species they remain dormant until the ensuing spring. There appears to be two distinct sets of colour cells in the segments of the perianth, the inner never exactly corresponding with the outer. A few species are essentially various in their colouring; others are perfectly constant, and still others—for example *Crocus cancellatus*—change gradually in tint from east to west, namely, is purple in Asia Minor, lilac in Greece, and white in Ionian Islands. There are also cases of mimetic variation. The pollen grains, though chiefly spherical, nevertheless possess special specific characters—colour, size, and ornamentation distinguishing them. The stigmata are so wonderfully diverse that MR. MAW

cannot adopt Mr. BAKER's threefold classification based thereon, though he admits their characters are valuable in the determination of species. The seed of the vernal species is matured about midsummer, and that of the autumnal species in November, the vegetation of the former being delayed till the spring. Contemporaneously with the maturity of the seed the foliage and the roots attached to the last year's old corn die away, and the life cycle is completed with the new corn in the condition of rest. A difficulty presents itself in the natural grouping of the Crocuses, the specific characters interlacing and overlapping as to give false ideas of association; therefore any arrangement must necessarily be based on a combination of characters. Mr. MAW adopts a somewhat modified view of Dean HILBERT's classification in preference to that of HAWORTH and BAKER. The Crocuses, geographically speaking, are confined to the Old World and northern hemisphere, their chief area of distribution being around the Mediterranean and Black Seas, and where they form comparatively an important feature in the flora. Mr. MAW divides their region of occupation into nine somewhat arbitrary sub-districts, viz.—1, West European; 2, North Africa; 3, Swiss and French Alps; 4, Italy; 5, East European; 6, Asia Minor; 7, Caspian; 8, Syria and Palestine; 9, Central Asia. *C. biflorus* has the widest range, extending for 35°, from Italy into Georgia; *C. sativus* in its various forms follows, ranging through 30° of longitude—i.e., from Italy to Kurdistan. The islands of the Mediterranean offer curious examples of limited distribution; as *C. Cambessedesii* is found but in the Balearic Isles, and *C. cyprusus* and *C. venericus* in Cyprus and Crete. Mr. MAW's observations go to show there are no wild hybrid Crocuses, and he points out that there is a great tendency to morphosis in every part of the plant. Both to botanists and horticulturists the genus is of exceptional interest. Mr. MAW's paper, with many of the details of which our readers are familiar from his contributions to our columns, was illustrated by numerous illustrative specimens and drawings prepared with great skill and patience, and bore testimony to the thoroughness of the study made by Mr. MAW of the living plants under cultivation, as well as in their native habitats.

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending January 23, issued by the Meteorological Office, London.—The weather has been very gloomy with a great deal of mist and fog. The temperature has been below the mean over the greater of England, but continued above it in Scotland and Ireland; in "Scotland, E." the excess was 7°, while in "England, S." the deficit was 4°. The highest temperature during the period (55°) was registered at Aberdeen on the 18th, while the lowest (25°) occurred at Colmington (Devon), on the 22d. The rainfall has been much less than the mean everywhere, and in the south-west and north-east of England the weather was quite dry. Bright sunshine was very little prevalent, the percentages varying from 4 in "England, E.," and 7 in "England, S.," to 26 in "England, N.E.," and 27 in "Scotland, E." Depressions observed:—During this period an extensive area of exceptionally high pressure has existed over England and France, while a few depressions have passed in an easterly or south-easterly direction over Scandinavia. The winds, which were light in force, blew chiefly from east in the south, from south in the west, and from the westward in all the more northern parts of the kingdom.

— GARDENING APPOINTMENTS.—Mr. CLARKE, late Gardener at Melton Constable, has been appointed Gardener to Lord Trevor, Dyrhynkall, North Wales.—Mr. JAMES DICKSON, Gardener at Arkelton, Langholm, N.E. (who was the first to introduce the very large bunches of Grapes at the International Flower Show at Edinburgh), has been appointed Head Gardener to ROBERT JARDINE, Esq., of Castle Milk, Lockerbie, Dumfriesshire.—Mr. ROBERT HENDERSON, from DOWNIE & LAIRD'S, Pinkhill Nursery, has been appointed Gardener to COL. ELLIOT, Hazel Bank, Murrayfield, Edinburgh.—Mr. H. R. HOIMES, Foreman to Mr. PHILLIPS, at Patshull, Wolverhampton, has been engaged as Gardener to the Hon. C. FINCH, Offchurch Bury, Leamington.—Mr. J. SLACK, for four years Foreman to Mr. GADD, at Wollaton Hall, Notts, has been appointed Gardener to T. MACGEORGE, Esq., Elston Hall, Newark.

HOME CORRESPONDENCE.

Teophiponia cyanocrocus.—With regard to this plant I may say a few words, as I have had it in flower every March for four or five years, and find no difficulty in growing it. It is not mistaken it is not an herb but an aberrant genus of the Amygdalaceae, but certainly has an inferior ovary. It is found in Chili, and I expect that the island of Juan Fernandez is an erroneous locality, though it may also occur there. I grow it planted out in a cold frame, with many bulbs of a similar character, and put a mat over the light in frosty weather. Max Lechlin, who grows it much better than I do, says, it is too beautiful to expose to the inclemency of an English March. That gentleman has also a fine variety of species, *T. Keqchi*, which, through his kindness, I hope to have in flower very shortly and will report upon, but it must be very good indeed to beat *T. cyanocrocus* when well grown. The plant ripened seed with the last season, and is likely to maintain itself in cultivation, I think, which is not the case with *Nemastylis* Herbott and other Texan bulbs, which, though very beautiful, are too short-lived and too delicate in constitution for the climate. *H. J. Eboes.*

Mice in Gardens.—There are four kinds of mice likely to do more or less mischief in gardens. The omnivorous and ubiquitous house-mouse (*Mus musculus*), which generally confines itself to the garden-houses and greenhouses, and the long-tailed field-mouse (*Mus sylvaticus*), which generally proclaims its presence in winter by digging for Crocus bulbs; both these kinds are easily cleared off by traps. Far more troublesome, however, are the short-tailed mice or voles, which seem sometimes to come in swarms, and are not easily got rid of. The field vole (*Arvicola agrestis*) is troublesome on damp lawns, making his burrows all over the tennis grounds, but feeding in open weather chiefly on the grasses and clover he finds there. In snow, however, he takes to barking shrubs, dwarf Roses, young Hollies, climbing for this purpose quite into the summer sky. The best remedy for his misdeeds is to encourage weasels in proportion to his numbers, as he will not be enticed into a trap by any bait. The greatest pest of all, however, in a garden is the bank vole (*Arvicola riparia*) which has invaded my garden in great numbers during the past year. These feed principally upon the young growth of herbaceous plants, selecting the choicest. They appear particularly fond of Columbinas and Hellebores, some of which I have been obliged to protect by wire gauze. Lately a bunch of Hellebores damaged in flower was eaten down to the ground in a night, and it would be interesting to know whether the mice were poisoned by it. A friend, writing from Devonshire lately, told me that his Hellebores were eaten by water-rats, but he afterwards discovered the culprits to be bank voles. The bank vole is readily distinguished from the field vole by the bright chestnut-red of the back. Unlike the field vole it is easily caught in traps baited with cheese. I have also seen it in quantities by burying to the rim against walls flower-pots with greased rims half filled with water; but for all I can do the plague still goes on, and I look upon the weasels which have come to my aid as useful servants. *C. Wolley Dod, Edg. Hall, Malpas, Jan. 16.*

Escallonia rubra var. punctata.—This pretty shrub, which Mr. Moore at p. 76 accords a place in the Hardy section of the *Best Novels* of 1881, is not really an introduction of that year. The first record of this fine tree is in the *Botanical Magazine*, tab. 6590, was drawn, was presented to the Royal Gardens some time ago by Messrs. E. G. Henderon under the name of *E. sanguinea*. In the interests of garden synonymy it seems desirable to put this on record. *Geo. Nicholson.*

Satyrium nepalense.—This interesting and rather pretty terrestrial Orchid is now flowering in one of the cool compartments of the T range at Kew. It has a spike of pretty rose-pink-colored blossoms, which, like those of *S. sp.* (of the genus, are two-lipped, the connate sepals and petals being directed downwards, and forming the lower lip, whilst the upper is represented by the erect, saccate labellum, with its peculiar double spur. A figure is being prepared for the *Botanical Magazine*. *Geo. Nicholson.*

Strawberries for Market.—Thanks for Mr. W. Hind's reply to my inquiries. Vicomtesse Hericard de Thury I grow, but it is too small for the general public here. President I grow too, and in splendid variety it is as a second early. And Sir Charles Napier and Sir Joseph Paxton one and the same? [No. 10.] I grow the last-named, and it is all that I could wish for as a late kind, but my principal object is to get a very early variety with the

qualities of President and Sir Joseph Paxton. *Market Gardener, Daxington.*

The Vicomtesse Hericard de Thury Strawberry.—This is the best early Strawberry that I am acquainted with, and should find a foremost place in every collection, whether in private or public establishments, where an early supply of this delicious fruit is aimed at. The plant is a good gazer, and when well done throws up its flower-spikes freely—even in the absence of sunshine, as evinced during the last few months. When touched over with the camel's-hair pencil about mid-day for a few days to distribute the pollen, the fruit attains a good size, and is of excellent flavour and colour. In short, it is a Strawberry that should be kept well before the public by those who have grown and fairly tested it alongside other recognised early varieties, so that it may become as well known as its good qualities unquestionably entitle it to be. And by way of supplementing these remarks, I would add, that at the present time (Jan. 23), we have several plants of the Vicomtesse averaging about seven fruits each, approaching maturity and good in size and colour. *H. H. Ward.*

Genista radiata.—What a charming and interesting leguminous flowering hardy evergreen shrub this is, and yet how seldom it is that we meet with it in private gardens. Introduced from Italy in the year 1758, and with a constitution sufficiently hardy to enable it to withstand and bid defiance to our severest winters, it seems almost a matter for surprise that it is not more frequently seen in our shrubbery borders than it is. When aglow with its bright yellow flowers in July it is exceedingly pretty and very useful for cutting; this it will bear with impunity, as it is very floriferous. Owing to its dwarf and sturdy habit, which seldom exceeds 18 inches in height, it is consequently suited for planting, and as an edging to banks, mounds, or clumps of Rhododendrons, hardy Azaleas, &c., indeed for this purpose it may almost be said to be unique. It is of easy culture and propagation, and would doubtless grow in any ordinary garden soil, even though it be of a poor and hungry nature, but like all other things which are worth growing it is worth growing well and will pay for liberal and kindly treatment. It may be increased either by seed or cuttings, the latter to be taken off towards the end of April or after flowering, with a heel, to be put in under a handlight in a shady place, using a compost consisting of soil, leaf-mould and sand, two parts of the first to one of each of the two latter. *J. Dowdall, Heysham.*

Euonymus latifolius, or the broad-leaved Spindle-tree, is the best of the deciduous species of the *Euonymus*. It is indigenous to the south of Europe, and unlike its evergreen congeners from China and Japan is perfectly hardy. It has been introduced to this country for more than a century, but is possibly less planted than (from its great beauty) it might be expected to be. The great attraction, however, of this shrub, or small tree (for it attains to a height of at least 20 feet), is its singularly pretty and curious looking fruit. And it has possibly been more than usually fruitful, and consequently more attractive and ornamental, during the present season, as it is usually so scarce. It seldom fails, however, to produce in abundance its numerous racemes of bright red fruit, which are loosely suspended by thin thread-like stalks, and as soon as the fruit has attained to a certain degree of ripeness the capsules fly open, and disclose the persistent orange-coloured seeds, which greatly enhance the beauty of the plant, which taken altogether, forms an exceedingly attractive object when seen as a standard or single specimen upon a lawn. Although deciduous the plant is nevertheless ornamental at all seasons of the year, but it is during the months of August and September that its beauty is most conspicuous. When planted, as it mostly is, in mixed plantations of trees and shrubs, its ornamental character is likely to be to a great extent concealed by other objects; but as a standard upon the lawn, or in that form planted among low-growing shrubs, so that its drooping branches and depending racemes of bright coloured fruit are seen gracefully over the top of lower growth, the effect produced is remarkably pleasing. It is easily produced from seed, which during most seasons is sufficiently abundant. *P. Griese.*

Agathæa cœlestis.—Now that this has come to be designated the "Blue Marguerite," it is probably destined to become one of the "fashionable flowers" of the future. It certainly is a most lovely flower and quite a gem in its way, and would look just as well woven on the Lyons shawl as the white Marguerite does on the French silks and stims. Our æsthetic friend with her Bradford gown and "Tam o' Shanter" hat bedecked with this blue Marguerite would look altogether "intense," and not at all "too utterly too." It may not be generally known that it is admirably adapted for sub-tropical bedding, when

planted out as a ground-work to such things as *Grevillea robusta* and *Acacia lophantha*; it has when in flower a most charming effect. Small plants in 4-inch pots are also at this time very useful for decorative purposes, and have, when used in conjunction with Maidenhair Fern, and seen by gas or candle light, a very chaste and lovely appearance. It grows well in loam, a little peat, leaf-mould and silver-sand, and is easily propagated by cuttings. *J. H.*

Double White-flowered Auricula.—Can any of your readers state that they have seen this plant? I have seen it regularly quoted in the catalogue of a celebrated Belgian firm, but have never been able to obtain a plant. I possess three distinct varieties of the double yellow, double black, or dark purple, and a confused variety of green-edged. The double white I believe to be a myth, *Alpha*.

Concerning Winter Bouquets and Flowers.

At a time when the old-fashioned Christmas Roses that have so long graced the glasses of boudoir and drawing-room are fast going to be inappropriate to remind our fellow-readers of a few flowers that may take their place with good effect in the vases. The dark Hellebores, though not nearly so lovely in themselves as the white Roses, still have an interest of their own. *H. atrorubens*, with its clustered heads of a colour between maroon and purple, but softer than either, forms a charming combination with *Hedera aurea*, the arborescent variety (with nice little sprigs), and the broad-leaved marbled Ivy (*H. marmorata*), the dead gold of the former and neutral grey of the latter complete a very choice harmony of subdued colours—the large marbled leaves placed round the edge of a wide and rather flat glass,—the erect golden sprigs and maroon Roses forming the centre of the group. The latter should have the clusters divided to make them last longer: if the room is cool they will do so for a long time, but not if the thermometer is at 60°. In the library at a temperature of 57° they last for weeks in water. The white leaved *Aucuba* forms a pretty foliage for the white Christmas Roses, as it simulates their own greenery, which is not durable in water. Another charming bouquet may be formed of the winter Honey-suckle (*L. fragrantissima*) mixed with sprigs of *Pernettya angustifolia*, with its bright coral berries. This was most successful and as sweet as it is pretty. A few bits of *Chimonanthus fragrans* were added, which has the scent of "glorified" pomatum (as Charles Lamb would say), and finished off with two *Triteleias* which came unexpectedly, as a foretaste of the spring. The above-named *Pernettya* is much more inclined to berry than the other sorts; indeed it always does, and is so neat in its habit. There have been incessant sheets of winter Jasmine this year—quite a golden fleece—and this looks best with green only, such as narrow-leaved Myrtle, or, if large branches are cut, the *Grevillea* *Hilli* furnishes an elegant foliage, and lasts well in water. The addition of white Christmas Roses is also pretty, white and gold being always as harmonious as orange and grey; without any green they are so especially. Orange *Nasturtiums* and grey streamers of *Cerastium* give a never-to-be-forgotten bit of colour, the glass being hidden by the hoary locks of the alpine. We have never been without winter *Heliotrope* (*Tussilago fragrans*) this season; and, as Miss Hope justly remarked, it looks best in its own broad leaves. Another pretty hardy gem is "Winterberry" (*Prinos glabra*): its light colour gives a lively effect with dark Myrtle and deep green Holly. An ivory-tinted *Hel-lebore* is just coming out; it is marked "orientalis," but perhaps fits only a variety of *H. olympicus*. The little Scotch kind is very nice and prolific, tinted with pink sometimes, like a cameo-shell (but why called grandiflorus?). We met with a quantity of *H. viridifolius* in the mountains of Auvergne this summer, or rather about the foot of the hills, in the valleys near Volvic, especially in that lava district. It is always satisfactory to avoid cutting in the houses. Every *Cyclamen*, Roman *Hyacinth*, rosy *Euphyllium*, or pale *Primula* seems to be missed by the eye that glazes over these passing treasures, when one is gone from its place. Many months has the worthy gardener spent in raising up this monument of perishable beauty in the conservatory: he has been piling up, little by little, the elements of floral colour and grace, day by day, as he prays; he has even been thinking of them for more than a year; at once the study and the product of his life to be marred in a moment, perhaps by a lady, with a pair of scissors, ruthless as the shears of Atropos, who wishes for a bouquet or a wreath to wear in the evening! Let the eye feast while it may on the rich orange of the well-berried *Solanum*, under which massive *Hyacinths* nestle—well-grown bulbs. Look! there is dark Uncle Tom's Root, like *Chionodoxa*, and under the green Myrtles and *Grevillea* white spikes of *La Tour d'Auvergne*, pink *Circe*, and the rich rose of *La Reine des Jacinthes*, which beats the Enchantress, fair though she be; over them arch sprays of snowy *Deutzia*, and the richly-painted leaves

of *Eurya latifolia*—all too good to cut, and far too beautiful; and again, there are scarlet *Van Thols* peeping through a *Pteris tremula*, the primitive red of the Tulip so happily broken and fringed by the soft Fern; and there beyond is the *Scaphoaria elegans*, now a large tree, on its carpet of purple *Oxalis*, and another smaller Palm, with its garland of softly tinted *Primulas*; the poor *Oleander* in the corner, but cold and green after those bowers of rosy bloom above us, or snow-white flowers that fell at our feet in the hot summer evenings in France, when those exquisite blossoms were perfect and prolific the very dry season that is gone. No!—

"Let the dainty Rose awhile
Her bashful fragrance hide;
Rend not her silken veil too soon,
But leave her in her own soft nook
To flourish and salute."

H. M. E., Jan. 22.

Labels of Glass.—I send herewith a suggestion for plant labels of glass, written on with an ordinary writing diamond, such as is in common use amongst microscopists for writing on glass slides, price 7s. Perhaps others may have tried this plan, but I have not seen it mentioned anywhere. Glass of the kind sent is very cheap, and the labels would be little, if any, dearer than wood, and the writing is indelible. Their fragility is a slight objection; but wood soon rots, and is easily broken with the rake or other garden tools. *J. C. J.* [The obvious objections to glass labels are such that we cannot recommend them for general use. *Ed.*]

Hellebore fetidus.—Mr. C. Wolley Dod was fortunate in not having an abrasion of the skin of his fingers when engaged in opening the seed-pods of the above plants. In the Midland Counties most farmers grow a few plants of the above, as it is used for producing suppurations in setons or rowels in calves as a preventive of blackleg. The tape used is rubbed with the acid juice of the plant, which produces suppurations in a few hours. *Alpha*.

Echeveria retusa.—This is a grand plant for decorative purposes at this season of the year; in Mr. Moore's nursery at Chichester it is grown very extensively. Some plants in 48-pots are very splendidly grown, producing as many as from six to eight well-branched sizes of its deep orange-coloured flowers. They last a long time, and are exceedingly attractive and useful. *A. O.*

Flowering Shrubs.—Two old favourites in this class have bloomed profusely this season, and are even at this date (Jan. 23) loaded with blossoms—*Chimonanthus fragrans* on a south wall, and *Garrya elliptica* planted among other shrubs, both south and north aspects, the catkins being much longer and finer at the south aspect. On the other hand *Viburnum Tinus* are completely without flowers, when at other seasons they bloom very freely; the two former shrubs deserve to be more extensively grown. *W. Pever,* *The Gardens, Walton House, Malton.*

KIMBOLTON CASTLE.

THE ancient seat of the Duke of Manchester, is well situated in a finely wooded park at an elevation which commands an extensive view of the surrounding country. The Castle is a nice drive distant from St. Neot's station on the Great Northern Railway, but perhaps the shortest and most accommodating route is from Huntingdon to Kimbolton station, from which the Castle is distant some 3 miles.

The drive from St. Neot's is on the west side, the trees, shrubs, and scenery of the park generally being of the most elegant and attractive description. The fine corridor is on the north-east front of the Castle, and a magnificent lawn, flanked by noble trees, is in complete harmony with the Castle, its balconies, terraces, and other external embellishments of architectural skill. The north front is beautifully undulating, and there are some fine groups of trees and rows of Lines of handsome proportions and in fine health. The Conifers and other trees and shrubs bordering the sides of the main drive are very effectively grouped or otherwise arranged, and are flanked by dense masses of Spruce and other trees for protection. Spruce, Pines, Oaks, and even *Wellingtonias* are rapid growers at Kimbolton. Perhaps the fine specimen Oaks in conspicuous situations, the grand "peeps," and lovely views of distant objects, a church spire, or the tower of a neighbouring mansion, or maybe the first tinge of autumn lit up in the leafy landscape by a passing shadow of radiance from the setting sun are among the most charming sights to be seen from the chief positions in front of the Castle.

The herd of deer skipping about or browsing on the face of yonder hill, or a distant head of cattle from his Grace's famous stock of shortborns, are seen enjoying the sweet herbage, and leisurely moving about under the shadow of huge Oaks, whose age or history no one remembers, but which all who love rural life can enjoy.

The gardens proper, or rather the portion that is known to horticulturists as the kitchen and fruit gardens, are but ten minutes' walk from the Castle. The hothouses, too, are within the precincts of the walled-in garden, which is a five-sided figure, and is abundantly stocked with vegetables of good quality, and fruit trees very prolific in their respective kinds.

The hothouses occupy the south and south-east walls, and comprise the ordinary stock usually found in such houses. The large greenhouse contains some good specimen and other Ferns for cutting, *Plumbago*, good *Camellias*, a fine specimen of *Trachelosperma jasminoides*, a useful collection of *Azaleas*, and *Orange* trees, a nice collection of New Holland plants, *Yucca purpurea* showing numerous flowers, a well-flowered sample of *Polygala Dalmaniana* creepers of different sorts, and a general assortment of other useful plants. In a fernery which divides the greenhouse from a range of vineries there is a noble Tree Fern (*Dicksonia antarctica*), and several stumps draped or planted with small Ferns and mosses for furnishing purposes.

How useful these old stumps are, when they are intelligently used, and the purpose for which they are required has received that care and thought which always anticipates the wants of an establishment months beforehand. The back wall of the house is also planted with Ferns for cutting—a good way of saving the pot-plants from being rendered unsightly by severe cutting in winter, which is the cruel fashion now-a-days. Every nook and corner that Mr. Kennedy can use is economically turned to good account, so that things that will succeed in the position, and by this means a good supply of cut flowers and Ferns is kept up in a simple but efficient way, which is proof that a cultivator possessing resources of his own can grow a great many things—and well, too—in structures of all kinds, and in situations which a great many never think of utilising for practical purposes. The foliage plants consist of the ordinary type of decorative subjects, useful in their way to associate with Palms, and to give colour and brightness to groups in winter. In a long lean-to vineyard a good crop of *Hamburg Grapes* was hanging at the time of my visit, of fair size and good quality useful table bunches, and numerous as they are good. The second vineyard is a mixed house of several well-known black and white kinds, ripe or ripening, and also a very good crop. The plant stove is very economically fitted with a miscellaneous collection of useful subjects. The back wall is neatly clad with *Ficus repens*. The roof is furnished with *Staphylea trifolia* ever stove creepers, and there are many handsome foliage plants and Palms of different sizes for furnishing. Several *Dracaenas*, Ferns, *Cyrtopodiums*, and other *Orchids*, I noticed in capital condition, the latter promising to flower well.

In a large range of pits, a very interesting collection of Australian plants was shown to me, many of which appeared to possess considerable merit for many practical purposes of decorating and furnishing. The plants have been raised from seed at Kimbolton, and include many varieties of *Acacia*, *Azaleas*, I noticed, were in good trim out-of-doors, and were being well prepared for early forcing. A batch of *Strawberries* for forcing were also making fine plump crowns, and were both vigorous and healthy.

In the Cucumber-pits good crops were growing, as also many plants that enjoy the same atmospheric conditions, and temporary winter gardening is carried on in the well-known summer style. A number of beds in the front of the hothouses minus carpet-bedding, which is not attempted. Centres of some of the figures were very gay with *Zinnias*, which seem to stand wet weather well, and no more showy plants can be grown in a garden.

The hardy fruits, Apples, Pears and Peaches, especially the former, were fine crops, and in a sheltered division of the garden of the lower gardening is carried on with Peach trees bearing heavy crops of good fruit, and the trees are in a healthy and prosperous state—the shelter evidently being advantageous to the health and fertility of the trees. The *Apocyns* were doing better here than elsewhere, and I saw more than an average crop upon the walls and standard trees in the open garden. Borders of *Violets*, hardy flower-borders, and collections of herbs, were healthy, and kept very neat and tidy, as, indeed, were all the other departments of the garden. The quarters of vegetables are well grown—winter crops, *Celery* especially, being very fine; and, taken as a whole, the management of the garden is conducted by Mr. Kennedy with success and judgment. *W. Hinds.*

Florists' Flowers.

AMARYLLIS.—How very speedily this beautiful spring-flowering plant has taken its position as one of the most beautiful of the section to which it belongs, and it will no doubt increase in popularity. Now is the time to repot the bulbs, but in doing this care must be taken not to over-pot them. When one has a few extra large and well ripened bulbs the temptation is great to give them a little extra pot-room, and an 8-inch pot may be selected to pot the bulb in when it would probably have done better in a 6-inch

show-house, or greenhouse, as soon as the first few flowers open. The greenhouse ought also to be kept rather warmer for a few days, and in this way the remaining flowers will open of a firm texture, and at this season they remain long in beauty. The plants intended to flower late—say in June—ought now to be in a cool-house where they are well exposed to the light and air. There is no need to give artificial heat to them if the frosts are not going to be more severe than any we have yet had. Fumigate with tobacco-smoke to destroy thrips, and if there are none, fumigate all the same to prevent their appearance.

CALCEOLARIAS.—These will now require more attention than they have had hitherto. The plants must frequently be looked over, and as they are often

tance from the stem. Sometimes, though not often, these are not to be had, and cuttings from the stem have to be used instead; but these latter have a greater tendency to rush into flower about May. The earliest struck cuttings of the Pompon section form good specimens for exhibition next season, but old stools of the large-flowering section are the best. These should be selected from the plants that have been grown to produce a few large blooms the preceding season. It is usually stipulated that the plants should be on one stem; those, therefore, must be chosen that have a few shoots coming out of the main stem a few inches above the surface.

CHINESE FRIMULAS.—During the late autumn, winter, and early spring, the greenhouse or con-

FIG. 22.—KIMBOLTON CASTLE, THE SEAT OF THE DUKE OF MANCHESTER. (SEE P. 120.)

AZALEAS.—Forcing Azaleas, or any other flowers, requires some care at this early season. If the flowers are hurried out in a high moist atmosphere they will not last long after they are removed to the greenhouse. If it is necessary to hurry them the temperature should be lowered—say to 55°—a day or two before the first flowers open, and more air ought to be admitted. The plants should be taken to the

grown in low lean-to pits which do not admit of a person getting in amongst the plants, in that case each plant must be taken out separately by the hand and examined underneath. Remove any dead or decaying leaves, and if one greenfly is found fumigate at once, as the Calceolaria suffers more from the attacks of this pest than almost any other plant, the Cineraria not excepted. Still repot later flowering plants as they require it—that is, as soon as the pots they are growing in are moderately filled with roots.

CHRYSANTHEMUMS.—If the cuttings for next season's flowering have not yet been put in, see to it at once. Perhaps the best way is to put each cutting separately into a small pot. Let the pots be placed in a cold frame for a week or more, and then they may be plunged in a very mild hotbed. Take root-cuttings—that is, those that come up at a little dis-

servatory is kept gay with these charming flowers; and since Mr. Barron introduced Wilmore's brilliant-coloured strain the improvement has been very rapid in quality and in colour. The deep red, or reddish-crimson varieties are very perfect in form, and the flowers are of large size; if to that could be added the large masses of flowers such as Mr. Cannell has produced in his pale pink variety, Princess of Wales, it would be a great point gained. If it is not intended to save seed, the seed-pods should be removed with the decaying flowers, which will considerably prolong the bloom. If the double varieties have gone out of bloom the plants should be placed in a position near the glass, and they should not receive much water, for after a little time the cuttings should be put in to produce the earliest flowering plants.

CINERARIAS.—These are now flowering well in the

4. A. formosum; 5. A. macrophyllum; 6. A. hispidulum; 7. Ficus tremula; 8. Adiantum assimile; 9. Adiantum... apparently a scarce growth of gracilimum; 10. Adiantum formosum.

ORANGES. Middlesex. Your statement in no way invalidates the remarks made by Mr. Douglas at p. 51, which refer to the systematic production of crops of oranges for the soil, and not to the occasional ripening of a few fruits. The fruit, as ripened under the circumstances you describe we do not doubt, but that is not the most profitable way of growing them.

PAXTON'S "BOTANICAL DICTIONARY" J. T. B. 1868 is the date of the last edition.

READING CASES: N. M., York. No. FANONIA OR SASSIFLORA: E. J. Perkins. We have no exact information as to the poisonous or non-poisonous properties of this tree, but should imagine that, like the Yew, it is poisonous to cattle.

WORMS: H. Ker & Co. Messrs. Rutley & Silverlock, of the Strand, sell a worm-scoop which we have found very effective. Your customer might also use lime-water, or try the following plan—Dissolve 1 oz. of corrosive sublimate (poison) in a pint of hot water, adding two large handfuls of salt; and when dissolved, add a gallon of cold water, and apply it to the grass. You must be careful not to let ducks get to the dead-worms.

Special Offer by W. H. ROGERS

RHOENDEBIRN, 20 Standard and 10 magnificent specimens, well budded, 5s and 7s 6d. each.
 DWARF, 1s per 100; selected, 15s. per dozen.
 AZALEA, 4-cent, hybrid varieties, 15s and 25s per dozen.
 AZALEA PONTICUM, fine bushy plants, 50s. per 100, 9s. per dozen.
 MERICIA POLIFOLIA ALBA and RUBRA (Irish Heath), 20s per 100
 ERICA CORDONATA, quite hardy, 20s. per 100.
 ARIS ARISTOLIA, 2 1/2 feet, 12s. per dozen.
 CEBUS BOBANA, 3 to 4 feet, perfect specimens, 2s. 6d. each.
 CUPRESSUS MACROCARPA, 3 1/2 to 4 feet, 12s. per dozen.
 LAWSONIA, 1 foot, 12s. per doz.; 1 1/2 foot, 18s. per doz.
 THUOPSIS BOREALIS, 2 feet, 5s. per 100; 2 1/2 to 3 feet, 12s. per dozen.
 RETINUSPORA PLUMOSA AUREA, 1 to 3 feet, 12s., 18s., and 25s. per dozen.
 ARGENTEA, 1 1/2 to 2 feet, 12s. and 18s. per dozen.
 ARBUTUS, 1 to 1 1/2 foot, bushy and well rooted, 50s. per 100.
 OXYMYNUS OVATA MARGNATA AUREA, in pots 2s. per 100.
 ESCALONIA MACRANTHA, in pots, 50s. per 100, or 2s. per dozen.
 MAGNOLIA CONSPICUA, strong plants in pots, 18s. per doz.
 GIBBIFLORA LITTORALIS, in pots, 6s. and 9s. per dozen.
 COHONEA SIMONDSII, strong, 25s. per 100.
 DEUTZIA, Double and Single; RIBES SANGUINEUM, SPIREAS OF ALL VARIETIES, and WEIGELAS, 3s. per 100, or 4s. per dozen.
 LAURELS, Standard Portugal, 3s 6d. each.
 COHNETS, New Fother, 10s. per doz., 9s. per dozen.
 APPLES, Dwarf, of most approved sorts, 50s. per 100.
 ROSES, Dwarf, in beautiful variety, 50s. per 100.
 Besides the above W. H. R. has a large, general, well grown NURSERY STOCK, extending over 60 acres, for which prices and any information will be given on application.

To The Trade.

R. AND A. MORRISON, The Nurseries, Edin., beg to offer the following Seedling and Transplanted Forest Trees:—
 LARCH, true native. Price on application.
 " Transplanted, 4s. 10s. per 100,000.
 " Larches, 1s. 2 to 15 inches, 12s. 6d. per 1000; 18 to 24 inches, 15s. per 1000; 24 to 30 inches, 20s. per 1000.
 SCOTCH FIR, true native Highland Pine, 1-yr Seedlings, 4s. 7d. per 1000; 1 1/2-yr, 2-yr, Transplanted, 7s. 6d. per 1000; 12 to 18 inches, 10s. 6d. per 1000.
 PINUS AUSTRIACA, P. LARIC, P. MARITIMA, and MONTANA, 1-yr. Seedlings, 2s. 6d. per 1000; 2-yr, 5s. 9d. Transplanted, 10s. 6d. per 1000.
 ELMS, WYCH, 1-yr, 4s. 6d.; 2-yr, 5s. 6d.; and 1-yr, 1-yr 5s. per 1000.
 OAKS, ENGLISH, 1-yr, 2s. 6d. per 1000.
 Trade Catalogue may be had on application.

Buy your Potatoes now, while they are Cheap.
 S. BIDE has to offer a fine Stock of MAGNUM BONUM and SNOWFLAKE, a special price for which will be given for large quantities; also READING ABBEY, MAYNATS SHLEAF, and LATE ROSE.
 S. BIDE, Alma Nursery, Farham, Surrey.

STOCK PLANTS OF VERBENAS.—We have ready at the present time a large stock of the above, which for vigour and freedom from disease cannot be surpassed; they are very bushy, and bear a large quantity of clean healthy cuttings. Price 6s. per 100, or 14s. 6d. per 1000.
 Lists of sorts may be had on application to KEYNES & CO., Nurserymen, Salisbury.

Just Arrived,
TUBEROSES, Double American, in good condition. Prices on application.
 Also for GLADIOLUS BRENCHLEVENSIENS and various LILIES, including AURATUM, CHALCEDONICUM, &c.
 WATKINS and SIMPSON, Exeter Street, Strand, W.C.
BLACK and RED CURRANTS.—Strong 2-yr transplanted, 8s. per 100.
 J. GARAWAY AND CO., Durdham Down Nurseries, Clifton Bristol.

ROSES, extra Strong Dwarfs, in pots, of all the best kinds.
 Lists forwarded on application.
 EDWIN HOLLAMBY, The Nurseries, Groombridge Tonbridge Wells.

GRAPE VINES.—All the leading sorts, well ripened Canes in fruiting and planting sizes. Quantities of STRAWBERRIES also, in pots, to offer. Prices, &c., on application to FRAS. R. KINGHORN, Sheen Nurseries, Richmond, Surrey.

Hyacinthine candicans (Galtonia candicans).
LARGEST CULTIVATED STOCK IN THE WORLD.
 100,000 Flowering Bulbs ready for Immediate Supply.
E. H. KRELAGE AND SON, NURSERYMEN, FLORISTS, Haarlem, Holland, beg to offer this splendid Plant, the good qualities of which may be easily seen generally known at present. It is a first-rate Plant for bedding-out, to be placed in beds alone or allied with Gladiolus brentcheyensis or other plants with striking colours. The pure white flowers are very useful in Bouquets, &c. We supply this Plant in three qualities, according to the size of the Bulbs, viz:—
 First Size, per 12, 5s. 6d.; per 100, 25s.; per 1000, 250s.
 Second " " 3s. 6d.; " 20s.; " 150s.
 Third " " 2s. 6d.; " 15s.; " 100s.
 The Bulbs of all three sizes are sufficiently large to give flowers next summer. Trade prices on application.

STRONG QUICK, for Hedging; or extra Strong ditto, for Gapping. Prices on application to RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

Seakale—Seakale—Seakale.
 To NURSERYMEN and OTHERS.
FOR SALE, a very large quantity of very fine SEAKALE CROWNS and ASPARAGUS ROOTS, for Forcing. Apply to the Grower.
 Mr. WILLIAM BAGLEY, Millshott Farm, Fulham, S.W.

ADVISED TO INSPECT

The Extensive, Beautiful, and Cheap Stock at the St. John's Nurseries.

RICHARD SMITH & Co.,

NURSERYMEN and SEED MERCHANTS, WORCESTER.

THE FIRST BLUE PRIMULA-CARTERS' HOLBORN GEM

First-class Certificate Royal Horticultural Society, January 10, 1882.

Seeds of this magnificent Novelty will be ready for distribution in May next.

Orders will be executed in strict rotation.

To prevent disappointment it should be ordered at once.

Price, 5s. and 10s. 6d. per Packet Trade Price on application.

The "Gardener's Chronicle," January 21, 1882, speaks of it as follows—
 "The great feature is the New Blue Primula, 'Holborn Gem,' of which we saw, a few days since, 500 plants in flower, all of high quality and true to colour. The blooming habit of the strain is excellent, the trusses being thrown up well above the foliage, and the flowers look the spectacle straight in the face."

SEEDSMEN

By Royal Command to H.R.H. the Prince of Wales.

Estimates and Plans gratis.

"Art with Economy," Part I, Illustrated, post-free, 25 stamps. Mr. Fowler's New Illustrated Work of Reference on Horticultural Buildings, post-free, 10s. 6d. Prospectus sent gratis.

KEITH'S PATENT "CHALLENGE" BOILERS, FOR HOT-WATER HEATING.

Can be Heightened or Lowered to suit any requirements. They stand complete in themselves, and require no building work round them, being wholly "water jacketed," and thus entirely free from risk by fire.

These PATENT "CHALLENGE" BOILERS have about ten times the heating surface of the ordinary Saddle Boilers, and are certainly THE BEST, MOST POWERFUL, and MOST ECONOMICAL Hot-water Boilers in use.

See Prospectuses, References, &c.

One of these Boilers has been over a year in use, heating 7500 feet of 4-inch pipe (or nearly 1½ mile of pipe), at the Winter Gardens of Isaac Holden, Esq., Oakworth, Keighley. This Boiler has only a 30-inch square fire-grate surface, and has 306 square feet of effective heating surface directly over the fire.

JAMES KEITH,
Gas and Water Engineer,
EDINBURGH and ARBROATH.
Post Address—EDINBURGH.

Geometrical Mosaic and Encaustic.
TILE PAVEMENTS, for Conservatories,
 Verandahs, Entrance Halls, &c. Enamelled and Deco-
 rated Tiles, for Wall Linings, Fireplaces, &c.; also
 Extensive and beautiful Terra-cotta Plant Markers. Patterns and
 Prices sent post-free on application.
 MAW AND CO., Beetham Works, Broseley, Shropshire.

Rosher's Garden Edging Tiles.
 THE ABOVE and many other PATTERNS
 are made in materials of great durability. The
 plainest sorts are specially
 suited for KITCHEN
 GARDENS, as they har-
 bour no Slugs or Insects,
 take up little room, and
 once put down, incur no
 further labour or expense,
 as do "grown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone,
 very durable and of superior finish, and in great variety of design.

 Highly Commended, 1871. First-class Certificate, 1875.

Mr. W. THOMPSON, Tweed Vineyard, has written the following
 letter to a gentleman who inquires respecting this Boiler—
 "The Terminal Saddle Boiler is by FAR the best one we have
 here, and we have had all sorts. It does its work well, and with
 less fuel than most Boilers. It is the most economical and effi-
 cient Boiler we have, and has not cost expense since we fixed it
 some eight years ago."

Also 50,000 Fastoff, at 4s. per 1000, 250 for 6s., on rail. The Canes are small, but being well rooted are equally so good as large grown ones. Payments to accompany orders. Postal Orders on Knockholt. Apply to A. AND E. BATH, Colgate Farm, Sevenoaks, Kent.

CRANSTON'S NEW AND PURE GARDEN SEEDS AT MODERATE PRICES.

Write for our New Descriptive Catalogue, which contains all the most popular and profitable varieties to grow.

CRANSTON'S NURSERY and SEED CO. (LIMITED), HEREFORD.

NEW ONION CRANSTON'S "EXCELSIOR."

This grand new variety has in every way fully realised our expectations. It has already gained a popularity both for general crop and as a prizetaker, which few recent introductions can claim to. From all parts of the country we continue to receive eulogistic testimonials, thus proving it to be a desired acquisition. It has a very handsome globe-shaped bulb, with exceedingly small neck, and of a beautiful pale straw colour; it possesses mild flavour and excellent keeping qualities. The "Excelsior" has been grown alongside the most popular varieties of Spring and Winter Onions, and proved superior in every respect, many specimens weighing over 2 lbs. For exhibition purposes it will undoubtedly supersede all others.

First-class Certificate of Merit, November 16, 1880. Price per packet, 1s. 6d. Seed supplied Direct, or from the following:—BROWN & CO., Dundee Street, Glasgow. T. BLACK, Jedburgh. T. BURY, Oswaldtwistle, Blackburn. Mc. CUTBERT, Clifton Square, Liverpool. CONNOR & REID, Aberdeen. DICKSON, JAS., & SONS, Newton, Chester. DICKSON & KIRKINSON, Manchester. DICKSON & TURNBULL, Perth. RICHARD SMITH & CO., NURSERYMEN AND SEED MERCHANTS, WORCESTER.

ORCHIDS.

The Largest and Best Stock in Europe of good Established Plants. Tens of Thousands of Plants to select from.

MR. WILLIAM BULL

Begs to intimate that his Orchid-houses are always quite a sight, from the large number of plants in flower, and he will be pleased to show them to any one interested in this beautiful class.

MR. WILLIAM BULL

Recommends those desirous of having their Houses gay with Orchid flowers, to purchase good established well-cultivated plants, which bloom well, are far more satisfactory, and comparatively cheaper than newly imported or semi-established plants.

Establishment for New and Rare Plants, 536, KING'S ROAD, CHELSEA, LONDON, S.W.

WILLIAMS' CHOICE FLOWER SEEDS.

Abutilon, finest mixed	Per packet—s. d.
Begonia, Tuberos-rooted, finest mixed	12. and 2 6
Begonia, splendid mixed Hybrids	1 6
Cineraria, choice mixed Double	2 6
Cockscomb, Williams' Prize Strain	2 6

Awarded a First Prize at the Grand International Exhibition held in the Royal Botanic Gardens, Manchester, autumn, 1851.

- DAHLIA, single choice mixed 1 6
- The seed I offer of this popular plant has been saved by one of the oldest and most renowned Dahlia growers in the United Kingdom. It is the result of careful and judicious hybridisation of his Prize Plants—from which new varieties may therefore be expected. Sown in heat, in February, they will be freely in autumn if subjected to the usual treatment requisite for their cultivation.
- Edelweiss (Leontopodium alpinum) 1 0
- A beautiful little alpine plant, easily cultivated
- Musk, Williams' New Giant 1 6
- Pyrethrum aureum selaginoides 1 6

CATTLEYA LABIATA PERCIVALIANA

(Rehb. f.)

TRUE AUTUMN-FLOWERING LABIATA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by Order of Mr. F. SANDER, on THURSDAY, February 23, a wonderful Importation of this magnificent CATTLEYA. It is well known there are numerous varieties among the old Cattleya labiata, such as PESCATOREI, PICTA, &c., and the varied Bulbs show that many varieties are among the lots offered. It is true Autumn-flowering. Flowers will be on view of this the finest Brazilian CATTLEYA: sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed, lower part deep velvety-purple: in some varieties quite one half of the lip is dark; throat golden-yellow. We have never previously seen imported a Cattleya so floriferous: there is hardly a Bulb which has not flowered, and whose spike does not show three and four flower seats. Mr. Seidl, the lucky discoverer, states that one mass alone had 350 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importations which is altogether in simply superb condition. The whole will be given into Mr. Stevens' hands and comprise all that could be found, and none sold privately; but Mr. Sander earnestly invites prior inspection at the St. Alban's Nurseries, which are easily reached by the Midland, London and North-Western, or Great Northern Railways, from any of the Metropolitan Stations, Liverpool Street, King's Cross, or from St. Pancras, by fast train in half an hour.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

CATTLEYA MENDELII.

THOMAS S. WARE,
HALE FARM NURSERIES, TOTENHAM, LONDON.

THURSDAY NEXT.

CATTLEYA TRIANÆ, MEXICAN ORCHIDS, BURMESE ORCHIDS.

MR. J. C. STEVENS has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, February 9, at half-past 12 o'Clock precisely:—

A GRAND IMPORTATION OF

CATTLEYA TRIANÆ.

Collected by Mr. Schmidtschen in the same locality whence our last importation came. Some of these have flowered and are magnificent varieties. The plants are in grand condition, full of green, sound leaves and unbroken eyes.

ODONTOGLOSSUM ALEXANDRÆ.

From the best locality. The masses are grand in the extreme, and in wonderful condition.

DENDROBIUM WARDIANUM.

DENDROBIUM CRASSINODE BARBERIANUM.

DENDROBIUM FALCONERI.

Just home from Burmah—in grand condition.

LÆLIA ALBIDA.

Many amateurs consider this the most lovely Orchid grown. Its easy culture, great floriferousness, and its coming into bloom, as a rule, about Christmas, add greatly to its merit. The consignment is unusually splendid, consisting of masses of largest size.

LÆLIA ANCEPS.

Immense and distinct-looking masses of this magnificent Orchid.

CATTLEYA CITRINA.

Unusually fine importation of this splendid, short-bulbed, large, and dark-flowered variety.

CATTLEYA AUCKLANDIÆ.

Fine importation.

CHYSIS AUREA, a magnificent lot of this lovely Orchid; ODONTOGLOSSUM CORDATUM, large masses of LÆLIA ANCEPS ROSEA, EPIDENDRUM DICHROMUM (AMABILE) lovely free-flowering species, flowers rose, 2 inches in diameter, lip rich crimson; and other ORCHIDS.

May be viewed morning of Sale, and Catalogues had.

SATURDAY, FEBRUARY 4, 1882.

NEW VEGETABLES OF 1881.

IN the vegetable department the race after novelty, and the search for new and improved varieties, are still as brisk as ever. New vegetables, are, however, scarce, although new names are over-abundant. As we have before remarked, the improvement amongst vegetables is more due to careful selection than to the raising or introducing of new varieties. The term "improved," so much hackneyed of late, is justified whenever by careful selection the stock is rendered superior to that ordinarily to be met with.

Potatoes—to which we first direct attention—form an important exception to the general rule. For here we have decided novelty—decidedly new and improved varieties, produced, moreover, in no haphazard manner, but with considerable skill and definite purpose. There can be no question that if the numbers of varieties of the Potato have increased during the past few years, they have become improved also in appearance, and much more so in quality. The high quality of the new Potatoes submitted during the past year, and their fine appearance, were particularly noticeable. Mr. Fenn, the most successful raiser of new varieties, is to be congratulated on the success of his efforts. Our thanks are due to him especially, and to Mr. Alexander Dean, who is a very worthy disciple. Of Mr. Fenn's seedlings Standard is a very excellent round white. Fenn's No. 29, a very handsome pale red kidney, is a most extraordinary cropper, and one of the finest Potatoes as regards quality. Mr. Dean's Lord Mayor is a rough-skinned round white. Early Cluster, a very early half-round white, with a remarkably short top, will prove extremely valuable for forcing. Cosmopolitan, the produce of a cross between the American Success and Woodstock Kidney, is early, large, handsome, a great cropper, and of good quality. Garnett's Seedling, from Mr. Garnett, is a fine large white kidney. Foster's Seedling, a beautiful round, pale yellow-fleshed variety, is also to be noted. Victoria Kidney (Edwards), a wonderfully flattened and very distinct form of Paterson's Victoria, is another fine variety; and Fortyfold White (Farquhar), very much after the Schoolmaster type, is also deserving of notice. Defiance (C. Lee & Son) is a large purple kidney, handsome, and stated to be an extraordinary cropper.

Of American Potatoes the number of new aspirants is still as great, and the advance in point of quality equally, if not more, decided. The newer seedlings raised by Messrs. Brownell and Messrs. Rand, and about to be sent out by Messrs. Bliss & Sons, of New York, are very superior as regards quality to any of those of earlier introduction, as proved in the trial-grounds at Chiswick, the following varieties being specially selected:—Vermont Champion, round white; Iroquois, oblong white; President, round white; Fremont, large long white; also of somewhat older date, Adirondack, round white, splashed with pink round the eye—a very beautiful variety, almost sure to become a favourite; the Queen of the Valley, oblong pale pink; Matchless (Hooper), very beautiful

THE QUEEN'S SEEDSMEN
WORDSLEY, STOURBRIDGE.

rosy-pink, and an extraordinary cropper; White Elephant (Daniels) and St. Patrick (Veitch) deserve notice also, as being very serviceable and meritorious sorts.

To the Celeries Messrs. Rutley & Silverlock give us a very good addition in the Winchester Red, a variety with very large leaf-stalks.

In Cauliflowers Messrs. Veitch's Extra Early Forcing, of the Early Erfurt type, will prove very useful. Amongst Onions Carter's Golden Queen, a straw-coloured variety of the Silver-skin, small in size, like the New Queen, and Carter's Silver Ball and Golden Globe Tripoli may be noted as distinct forms.

Tomatos now command a large share of attention, and hence we have a number of new varieties. Trencham Early Fiddlebasket may be noted as one of the most promising and useful varieties, and for beauty and solidity of flesh we name Dedham Favourite, a smooth dark red fruit. Messrs. Hooper give us also Abundance, having a very fine character; and from America we receive Livingstone's Perfection, stated to be of very superior merit.

Peas are special favourites in English gardens, and the raising of new varieties has long been an object of great interest. Amongst the more important additions during the past year we would mention Carter's Pride of the Market, which as far as we may judge from present appearances may be pronounced the best main crop market Pea in cultivation. Robert Fenn (Hurst), a dwarf marrow, is a variety of great excellence, coming into use the same time as Advance. Walker's Perpetual (Nutting), a much branching dwarf green marrow with well-filled pods, and an extraordinary cropper. Laxton's Earliest of All (Hooper), one of the earliest of all Peas, and of remarkably fine quality. Bunyard's Four Hundredfold, a very deep green marrow, with remarkably well-filled pods, and an immense cropper. Sharpe's Invincible and Culverwell's Giant Marrow may also be mentioned as new and proved good varieties. Many other aspirants full of promise are yet on their trial, the merits of which we hope to chronicle next year.

SABAL UMBRACULIFERA IN JAMAICA.

RUNNING parallel to the southern coast of Jamaica, and trending in a north-western direction from Alligator Pond to Black River, are the Santa Cruz Mountains. These mountains are composed of the characteristic white, porous limestone of Jamaica, and rise to heights varying from 2000 to 2300 feet. At the foot, and occupying the undulating country between the mountains and the sea, varying in breadth from 6 to 9 miles, are stretches of savannah lands, known as the Pedro Plains or Pratee Country.* The prevailing soil of the plains is composed of red mud, with here and there a deposit of gravel and alluvium. The district generally is hot and arid, the mean annual rainfall being about 50 inches, while the temperature is seldom under 80° Fahr. This is the home of Sabal umbraculifera.

The Palm is known locally as the "Big Thatch," or "Ball Thatch," and also as the "Palmetto Royal." A recent visit to these comparatively unfrequented Pedro Plains gave me an opportunity of seeing this magnificent Palm in its native country. On the authority of Purdie, Grisebach (*Flor. Brit. West Indian Islands*, 1864, p. 514) rightly notes this Palm as indigenous to Jamaica, and mentions "Black River savannah" as its habitat. Although sparingly distributed along the plains from Alligator Pond to the westward, even as far as Savanna-la-Mar, it is evident that its true home is confined within the limits of the Pedro Plains, and its abundance and magnificence there very clearly to my mind establish its indigenous character.

It would appear, however, that before Purdie's visit

the original source of this noble Palm was involved in some obscurity. For instance, in Dr. Seemann's *Popular History of Palms*, 1856, p. 337, published a few years before the *Flora of the British West Indian Islands*, we find the following remarks, quoted on the authority of Mr. John Smith, ex-Curator of the Royal Gardens at Kew:—"Although we have long known this species (*Sabal umbraculifera*) to be quite distinct from the well-known *Corypha umbraculifera* of the East Indies, yet we are still uncertain about its native country—it is generally supposed to be the West Indies, but we furnish no evidence of that being actually the case. All the specimens cultivated in England are very old, and it is singular that new ones have never, so far as my personal knowledge goes, been imported."

The botanical characters of *S. umbraculifera* are well described by Grisebach, and it is only necessary here to add one or two supplementary remarks. The trunk is singularly smooth and straight, free from ring marks, and uniform throughout. It sometimes attains a height of 90 to 100 feet, with an average circumference of 5 to 6 feet. The outer portions of the stem have an iron-like firmness, which is in marked contrast to the somewhat soft and fibrous nature of the inner portions. On this account narrow planks are made from the narrow rind, and pots, beehives, and various utensils are obtained from short portions of the stem hollowed out.

The large glaucous and suborbicular leaves are about 5 or 6 feet across; they are multifold, from one-third to two-thirds of their length, and have loose fibres between the bifid lobes; the segments are very acutely pointed with the ends somewhat pendulous; the unarmed petiole is much longer than the leaves, and remarkably strong. The spades appear among the leaves, and are about one-half as long; the branches are paniculate, with sessile blackish berries 4—6 inches in diameter. Plants appear to flower and produce fruit at all stages. One was noticed in fruit when quite stemless. This Palm is essentially gregarious; it is found covering several thousand acres, literally forming extensive groves in the Pedro Plains. These are known locally as "thatch fields." They occupy chiefly dry elevated banks and strips of land between numerous lagoons and morasses—the haunts of turtles and alligators. Seen across one of these lagoons the effect produced by a view of this Palm forest is indescribable. The tall, straight, cylindrical columns surmounted by their globular masses of fronds, often 25 or 30 feet across, are seen to rise out of a sea of green sedges and grasses, and as no other growths intervene the result—merely as a matter of scenery—is well worth a visit to the tropics to behold. Under such circumstances even the most sceptical would admit that Palms are rightly named "the kingly race of plants." Kidding underneath nothing could surpass in grandeur and beauty the effect produced by innumerable tall stems canopied by immense fan-shaped leaves rustling and rattling against each other in the refreshing breeze.

In the adult stage *Sabal umbraculifera* has all the majestic mien and habit of the Talipot Palm, *Corypha umbraculifera*, of Ceylon and Southern India. Indeed, to one familiar with the latter there is a great apparent similarity between the habits of the two Palms. The sharply pointed and pendulous segments of the leaves of the Sabal combined with their characteristic glaucous tint are, however, in marked contrast to the bluish and slightly bifid segments of the Talipot with its bright green leaves. Again, the free-flowering habit of the Sabal as compared with the solitary and final effort of the Talipot Palm, affords another important point of distinction: and the inevitable death of the latter after flowering would indicate that for avenues and ornamental Palm-groups the Sabal would be, by far, the better Palm to plant. It possesses also the merit of growing in comparatively poor soil, and in a climate very unfavourable for most tropical plants.

The fruit of the Sabal is like a miniature Date, and the sweet pulp with which it is enveloped attracts and supplies food for a large number of jabbering crows (*Corvus jamaicensis*), blue pigeons (*Columba inornata*), bald pates (*C. leucocephala*), and rat-bats. It is owing to these agencies, no doubt, that the Palm is so well distributed throughout the district. Of the economic uses of the Palm mention may be made of the leaves—the chief parts used—which form the only thatching material for both negro and European houses. Mats, ropes, hats, and baskets, are made from the younger portions of the petiole and leaves,

while, as already mentioned, the hollowed trunks, cut into short lengths, make admirable beehives.

It seems strange that while the Cocoa-nut Palm grows freely everywhere along the coast of Jamaica, it is almost entirely absent from Alligator Pond to Black River, viz., the district occupied by the "Big Thatch." At first, this was taken as an accidental circumstance, but careful inquiry on the spot convinced me that although the soil and climate differ very slightly from those of other portions of the island where the Cocoa nut thrives luxuriantly, all efforts to establish it in the Pedro district had signally failed. The plants appear to thrive for a few years, and to grow remarkably well, but before coming into bearing they suddenly die off from the top, leaving nothing but a bare stem.

After examining several trunks of the Sabal, and finding them completely riddled by the attacks of the larva of a beetle very closely allied to, if not identical with, the destructive Palm-beetle of the East Indies, I came to the conclusion that one, if not the chief, cause of the absence of the Cocoa-nut Palm in the district was the abundance of this beetle. Further information and inquiry in the neighbourhood has fully confirmed this view. The Sabal appears to exist and, indeed, to thrive luxuriantly, in spite of the beetle; but the Cocoa-nut fails. The terminal bud of the latter offers an easily accessible and tempting *bonne bouche* to the larva, and it succumbs to its attacks; on the other hand the Sabal thrives and covers the country. *D. Morris, Jamaica, Jan. 12.*

BIRD FLOWER OF MEXICO.

ABOUT fifty years ago Zuccarini founded the genus *Heterotoma*, upon a Lobeliaceous plant collected by Karwinski, on the peak of San Antonio, in Mexico, at an altitude of 8000 feet. The species he called *Lobelioides*. A few years later Presl described what appears to be the same plant, under the name of *Myopia mexicana*; and Bertolini, in his *Flora Guatemalaensis*, described it as *Lobelia calcarata*. It is very pretty, and though not so showy a plant as *Lobelia cardinalis* and some other allies, it is perhaps more interesting on account of the singular form of its red and yellow flowers. The curved corolla seems to be attached by the middle, and is perched, as it were, on the tip of a slender stalk. The closed or lower half is produced below or beyond the point of attachment in the form of a hollow spur. Along the under-side of this spur, and attached to it, are two of the calyx lobes, which extend a little beyond the spur, their short, free terminations curving upwards and outwards. The upper half of the corolla is slit down the front or under-side to the point of attachment, and the lobed limb is curved back, so that the whole corolla bears some resemblance to a bird. This is more especially the case just before the corolla opens and frees the stamens, which then project at almost right angles to the flower-stalk.

This curious plant seems to be common in the mountains of Guatemala, but we have seen no specimens from Mexico proper, though it is recorded from two or three localities, and was first described from reputed Mexican specimens. We are not aware that it has ever been successfully cultivated in this country, yet we may almost venture to say that it must have been tried, because both Hartweg and Ure Skinner collected it, and sent home dried specimens. Be that as it may, a little over twenty years ago it was in cultivation in Belgium, and a coloured plate of it appeared in the *Flore des Serres*, t. 1454. Unfortunately the specimen from which the drawing was made was drooping from want of water, and the artist, not being aware of the natural position of the flowers, represented them in an inverted position. The Editor makes a statement to this effect, adding, however, that it was their practice not to alter anything that was drawn from Nature, and that they had not made an exception in favour of the plant in question. Perhaps it was too late to do so! With regard to the name "Bird-flower" it seems to have been of Belgian origin, as we find no corresponding Mexican name for it. In the *Flore des Serres* the same opinion is expressed, and the designations "Petit Oiseau" and "Het Vogelleje," probably given to the plant by the brothers Fœnel, who introduced it. We think it probable that no very long period will elapse before it is seen in this country.

* This is the only portion of the island where descendants of the aboriginal Caribs are said to exist in Jamaica. They are very few in number, and are gradually being merged into the surrounding negro population. The Pedro Caves close by still contain interesting Carib remains.

New Garden Plants.

ODONTOGLOSSUM MIRANDUM, n. sp.*

I HAVE known this for a long while, and now propose it as a species, having up to the present time named it *Odontoglossum Lindleyanum compactum*. There is, however, an *Odontoglossum compactum*: hence I must take another name, and it is best to adopt one already proposed. It is very near *Odonto-*

The most liberal fresh materials were sent me by Mr. William Lee, Downside, Leatherhead. *H. G. Rehb. f.*

NEPENTHES RUBRO-MACULATA ×, Hort. Veitch.

This is a hybrid raised in Messrs. Veitch's nursery between *N. hybrida* and a Bornean species not identified at the time (probably *N. lanata*). It is of robust habit, with dark purple stems clothed with ferruginous hairs. Leaves partly amplexicaul, 12 inches long by 2 in width, rounded at the apex, leathery, very dark green, with three parallel nerves near the ciliate margin, and remote from the midrib. Pitcher (see fig. 24) 5–6 inches long by 1½ inch wide, leathery, yellowish-green, spotted with claret-red spots, cylindrical, slightly distended at the base, deeply winged, wings fringed, mouth oblique, surrounded by a broad, flat rim, the ridges of which are deep red; lid much smaller than the mouth, ovate, red-spotted, glandular on the inner surface.

N. hybrida ×, one of the parents of the plant, is said to have originated between *N. khasyana* and the pollen parent (the *N. distillatoria* of gardens) and an undetermined Bornean species. *M. T. M.*

NEPENTHES WRIGLEYANA ×, Hort. Veitch (fig. 23).

This is said to be the result of a cross between *N. phyllamphora* and *N. Hookeri*, and is similar to *N. Ratcliffiana*, but has rather more amplexicaul leaves and thinner pitchers. The light green leaves are like those of *N. phyllamphora*, are 10–12 inches long by 1½–2 inches in width, acute at both ends, glandular beneath, and with two or more parallel nerves on either side of the midrib. The pitchers are flask-shaped, with a thick cylindrical neck, pale green with crimson spots, wings narrow, ciliate, mouth oblique ribbed, ribs all green, lid broadly oval, smaller than the mouth, glandular on the inner surface, and with a simple spur. *M. T. M.*

BOMAREA VITELLINA, n. sp. (see fig. 26, p. 151).

The only materials at hand for the determination of this species consist of a water-colour sketch of the inflorescence and flowers prepared by Mr. Carder. It is, however, sufficient to show, by comparison with the specimens in the Kew herbarium, and with the descriptions of Herbert and Baker, that we have to do with an undescribed species belonging to the group, with branched inflorescence, large flowers, and unequal perianth-segments. In this section *B. lycina* is the only species maintained by Mr. Baker, to whose notes we have had the privilege of referring. From that species the present differs in its much laxer inflorescence, and longer flower-stalks. The colour of the flowers in the present species is, moreover, a rich orange-yellow, like that of the yolk of an egg. They are borne on long pendulous branched flower-stalks, arranged in an umbellate cyme, and surrounded at the base by a tuft of large ovate lanceolate leaves. Messrs. Shuttleworth, Carder & Co., have young plants in cultivation, so that we may hope soon to see more of this showy novelty, and to complete our now defective description. *M. T. M.*

MASDEVALLIA FRASERI, n. hybr.

This is a cross between *Masdevallia ignea* and *M. coccinea*. The tube of the flower is curved and rather slender, the limb is as in *Masdevallia ignea*. Whether the odd segment is always bent down I cannot say, the flowers having arrived in a faded condition. Perhaps Mr. H. Veitch will be so kind as to add a remark, provided he has kept the matter in memory. The colour of the limb, however, is the same as that of *Masdevallia coccinea*. It has also an entire androclinium: the two very obscure calli on the lip I never saw in *Masdevallia ignea*.

I find the angle over the anterior base of the petals not inflexed, as in the parent plants, but spread out and straight. I can scarcely believe a hybrid plant to present such a novel peculiarity. Hence, as I guess, the character may be constant in one or both parents. *Qui eviva verri.*

The leaf is long-stalked. It is decidedly a fine thing, but not such a showy thing as *Cyrtipedium Sedeni*, or *Lelia Dominiana*.

I obtained this rare product from Messrs. J. Veitch & Sons, who possess the stock raised by Mr. Fraser. *H. G. Rehb. f.*

ODONTOGLOSSUM CRISTATELLUM, Rehb. f.

This fine plant, with its rich brown and yellow flowers, usually adorned with neat red columnar wings and fine red borders to the keels, appeared at first as a monopoly with Mr. W. Bull, then with Mr. Oscar Schneider, Cromwell Range, Fallowfield, near Manchester. Now Mr. Duchan, Wilton House, Southampton, has been lucky enough to flower an unusually rich inflorescence from bulbs imported by Mr. F. Sander, of St. Alban's, and sent me by Messrs. J. Veitch & Sons. I was much struck by the unusually strong peduncle. It was sent by my friend F. C.

FIG. 23.—NEPENTHES WRIGLEYANA.

FIG. 24.—NEPENTHES RUBRO-MACULATA.

glossum Lindleyanum, but its large plump bulbs, its lanceolate leaves, its stiff one-sided raceme, and its well-developed rhomboid serrate columnar wings, render it easily discernible from the flaccid *Odontoglossum Lindleyanum* with its small, much thinner bulbs, linear leaves, lax nearly one-sided raceme, and far less developed columnar wings. The colours are far brighter than in *Odontoglossum Lindleyanum*. I have specimens from Messrs. Wallis, Chesterton, Coradine, Patin, Weir, Roccl, and Schmidchen, from the Frontino and from the Bogota districts.

* *Odontoglossum mirandum*, n. sp.—Affine *O. Lindleyano pseudobulbo pyriformi aciculis compresso*; foliis lanceolatis; pedunculo stricto valido; floribus quadrangulis; sepalis tepalique lanceis acuminatis; labello linearilanceo basi adnato antice reflexo, callis corniformibus geminis supra flexuram divaricatis; columna alis rhombis serratis.—*N. Granada*. (ex v. specimen ab. egr. Guillelmo Lee, Downside, Leatherhead.) *H. G. Rehb. f.*

* *Bomarea vitellina*, Mast., vide fig. 26, p. 151.—*Glabra, foliis ovato-oblongis acutis*; floribus laxo umbellato cymosis, cymis pendulis; pedunculis ad 12 longiusculis divaricatis parce ramosis, basi bracteis magnis foliaceis praectis; pedicellis floribus vix aequantibus; perianthi 2-pelticatis stonagato-campanulatis vitellino-aureantibus segmentis externis angustis oblongis acutis, segmentis internis late obovato-oblongis retusis apiculatis exteriora tertius longior. Character, ex nomine dom. Carder, qui in Colombia prope Oceanam detexit speciem.

Lehmann (whose last letter of December 16, 1881, brings very good news) under the name of *Odontoglossum Lehmanni*. It is decidedly one of the best marked and rarest of supposed hybrids. *H. G. Rehb. f.*

FICUS ELASTICA FOLIIS AUREO-MARGINATIS.

This is described in the *Gartenzeitung* as a very effective variety with golden-edged leaves, especially in autumn, when it has become full-coloured. The yellow band is about an inch broad, contrasting beautifully with the dark shining green of the centre. It was raised by a hybridist at Simmering seven years ago, and it has been offered £10 for the first five plants; and it has since been freely propagated, and will be sent out this spring. The writer adds that a similar variety exists in Belgium and England; most likely specimens that have mysteriously disappeared from the possession of the raiser!

THE KINGSTON-ON-THAMES NURSERY.

(Continued from p. 110.)

AMONG miscellaneous stock *Lapageria* in pots, *Vucca Whipplei*, and a large stock of hardy Ferns may be mentioned. Herbaceous and alpine plants are under the charge of one specially versed in the cultivation of this interesting class of plants, who understands the varieties that are most showy for general purposes, and who devotes much care and pains upon their cultivation.

At Kingston Hill the main stock of fruit trees, Conifers and other ornamental trees and shrubs is grown. The entrance to the nursery is off the Kingston Road, the main road to London. The entrance walk is bordered with duplicates of the more ornamental class of nursery stock, Weeping Ash and Birch, samples of *Abies nobilis*, *A. Nordmanniana*, *Lasiocarpa grandis*, *Pinus*, and *anabasis*; the choicer kinds of *Junipers*, *Cypresses*, *Retinosporas*, *Sequoia gigantea pendula*, *Taxus*, *Thuas* in great variety, *Taxodiums*, *Salisburia adiantifolia*, variegated *Hollies*, *Osmanthus ilicifolius variegatus*, flowering shrubs, hardy *Heaths*, and *Aucubas*. The nursery is divided into quarters in the usual manner, and consists of large quarters of fruit trees of every kind suitable for planting orchards; also dwarf standards and trained trees carefully grown for planting against walls or espaliers. Another branch, known as the Park Road Nursery, contains a splendid stock of *Privets*, *Hollies* in variety, English and Irish *Yews*, seedling and other *Conifers*, *Buxus* (a large stock), *Portugal* and common *Laurels*, quarters of *Elms*, *Beech*, *Oak*, and general nursery stock—all in first-rate order, through being regularly transplanted, and as a consequence having plenty of fibrous roots, which sustain the plants during the period of removal, and soon lay hold of fresh soil after being replanted. Fruit trees are also grown in considerable quantities in this nursery—small fruit trees, such as *Black* and *Red Currants*, *Gooseberries*, and *Raspberries* being especially fine.

In addition to the nursery business carried on by Messrs. Jackson, they are also largely engaged in market gardening, having rented the Royal Gardens at Hampton Court, where plants, flowers, fruits, and vegetables are grown extensively, and of the finest quality, and which are chiefly disposed of in the fruit and seed shop in Thames Street, Kingston-on-Thames. Apart altogether from the interest which attaches to a Royal garden so famous as that at Hampton Court, a notice of the management of such a garden can hardly fail to be acceptable to practical cultivators. Gardening is annually becoming more a question of pounds, shillings, and pence, than it has ever been during the memory of the present generation, and the detailed management of a garden that "must and does pay its way," will therefore be interesting, if not instructive, to those who are in quest of knowledge from practical sources upon the subject.

The garden under notice is, as nearly every one knows, situated on the north side of the Palace. There are four entrances to the garden, that opposite Hampton Court Green being considered the principal one. The garden is an oblong enclosed by four substantial brick walls, and is exactly 12 acres in extent. A wall running the whole length of the garden cuts it in two, lengthwise, and two walls running crosswise, equidistant from top and bottom, divides the garden into six quarters of 2 acres each. This arrangement, as will be seen, gives shelter and warmth, whereby early crops are considerably in advance of those in the vast majority of gardens. The soil, too, is free and open, while it is deep enough to grow root crops to perfection. The main walks are wide enough to admit of manure or other materials being carted on to the different quarters, which is an immense saving in labour from the ordinary system of wheeling.

In No. 1 quarter next to the Palace there is a range of forcing-houses in four divisions, 207 feet long and 18 feet wide. The range is about equally used for forcing *Black Hamburg* and *Muscat Grapes* and *Peaches*. Fine crops of *Peaches* are gathered annually from trees trained upon transverse trellising at 4 feet apart, which is considered the best system of training to secure the largest quantity of fruit. Quantities of *Chrysanthemums*, from 12 to 18 inches high, are also grown for furnishing, and are arranged in groups and masses under the leafless *Vines*. Over 6000 *Strawberries* in pots are forced in a range of pits, facing the south, 140 feet long and 15 feet wide

The pits are filled with dry leaves up to within 18 inches of the glass, and the pots are plunged in their respective kinds in the leaves, and brought forward in rotation as the season advances. Plants are grown in a house made into two divisions, about 140 feet long, and 18 feet wide, with a path up the centre and a pair of shelves suspended from the roof over the path. The shelves contain *Primulas* in flower and a splendid batch of *Mignonette* in small pots, with from four to six plants in a pot in full flower, and with deep green leaves down to the rim of each pot. The plants have been raised from seed sown last July and August—such a batch of plants as would gladden the heart of any one who is partial to fragrant smelling plants in a sitting-room, or even in an ornamental garden structure.

The body of the division is filled in each case with bedding plants, *Solanums*, *Richardias*, *Cinerarias*, and other soft-wooded decorative plants. The walls of this division are planted with *Pears* and *Plums*, and the open quarter with bush fruits and vegetables for forcing. The walls of the second division are stocked as follows:—*Pears* on the west aspect, *Apricots* on the east aspect, and *Peaches* and *Nectarines* upon the south. Standard fruit trees do not interfere with the vegetable crops beneath them, each having a clean stem of over 6 feet, and a spread of branches barely proportionate to the length of the stem. Small fruits and vegetables are planted in proportionate quantities, say three-quarter of an acre of *Strawberries*, a like extent of *cabbages*, sown last July, planted out in September, and expected to be ready for cutting by the end of next April.

The third division is called the Apple quarter, from the fact of its containing a greater number of Apple trees than the rest. Now for an example of the system of cropping. Early crops of *Potatoes* are planted a yard apart with summer *Cabbages* between, which are cut and a second crop of *Sprouts* allowed to follow, which are in use at the present time. When the *Potatoes* are lifted a crop of *Coleworts* succeeds them. The three favourite *Potatoes* are the old *Ashe-leat* for an early crop, *Covent Garden Perfection* for second early, and *Champion* for winter use. These are not all the kinds that are relied upon. *Raspberries* are planted among Apple trees. Over half an acre of *Celery* is grown, and whole horders of *Tartley* are sown in September, which give a supply for the whole year. It is gathered in quantity during the months of April and May. The walls of this division are stocked with a variety of fruit trees similar to the preceding one, and are improving in condition annually.

No. 4 division begins with the opposite side of the garden next to Hampton Court Green. *Figs* are grown upon the south wall here, and *Apples* and *Pears* upon the north wall; the arrangements upon the east and west walls do not differ from those already mentioned. The south border is cropped with *Prawn Cos*, *Hardy Hammersmith*, and *Grand Admiral Letuce*, planted at 6 inches apart each way; every alternate plant is drawn in spring either for planting out or marketing. At the base of all the south walls *Cauliflowers* are being wintered for planting out in spring; over half an acre of *Spinach*, three-quarters of an acre of *Savoy*, *Cottagers' Kale*, and a border of *Sugar-loaf Cabbages* ready for use, are the chief features of this division. Stock beds of *Strawberry* plants and herbs without number are grown in lines to meet the great demand upon the garden for these all-important garden products.

In No. 5 division small fruits, *Cabbages*, *Sea-kale*, and *Asparagus* are the most important crops. The beds of *Asparagus* are very fine. In the sixth and last division walls well stocked with fruit-bearing trees, crops of fine vegetables, including *Giant Rocca Onions*, *Little Pixie Cabbages*, *brakes* of *Coleworts*, and splendid *Bussels Sprouts*, *Endive*, and root crops are the most noteworthy products.

In the lower garden adjoining the Palace the south wall, 158 yards long, is covered in with a range of forcing-houses in nine divisions, eight of which are employed in *Grape* growing—the ninth division being a double *Peach-house*. Fine crops of early and late *Grapes* are grown in these houses, a fair sample of which Messrs. Jackson exhibited at the late show at Kingston-on-Thames—good-sized bunches, black as *Sloes*, and with a dense bloom which attracted considerable attention from fruit growers. These houses are occupied in winter with *Canellias*, *Azaleas*, *Chrysanthemums*, and stocks of other nursery plants

too numerous to mention in detail. *Figs* are grown in a span-roofed structure by themselves.

Two houses are, or rather have been, filled with pot *Vines*, now removed to head-quarters at the nursery; pits containing thousands of *Cauliflowers*, in pots, *Lettuces*, &c., are noticeable in the framing ground, where there are also pits of *Cinerarias*, *Calceolarias*, *Verbenas*, *Violets*, thousands of *Intermediate Stocks* to come into flower next spring, and *Mignonette*. Most of these pits are used for *Melon* growing in summer. In the *Cucumber-house* Jackson's *Prolific Cucumber* is growing and fruiting as freely as could be wished at midsummer—the fruits are of moderate length, good shape, and fine quality. It may be interesting to remark that most, if not all of the pit, detailed above were built for *Pine* growing when Hampton Court was a Royal residence: over 10,000 *Pines* were grown in those days, which must have entailed a good deal of hard labour when the system of *Pine* growing that was followed by our forefathers or even during the past generation is taken into account. Mr. Laytham is Messrs. Jackson's garden-in-chief—one of the Chatsworth school, thoroughly practical in every department of his business, and who knows how and when to sow and plant and when to force in order that the produce may bring its highest value. *W. Hind.*

FRUIT NOTES.

Very Late *Pears*.—I am sure the gardening community are much obliged to Mr. Carmichael, p. 111, for his list of late *Pears*, but they would be still more obliged if he would send up a few dishes to the next meeting of the Fruit Committee of the Royal Horticultural Society at South Kensington. The proof of the pudding is in the eating. We are also told that there is no enterprise in the trade to try the new kinds. Indeed? I think we have tried them pretty well and got our fingers burned, trusting to descriptions in catalogues. Mr. Scott in the English language tells us there is not a better in the English language than which that he grows 1800 kinds, I have done my share in this way, having grown, eaten, and drawn over 100 kinds, and perhaps it would be acceptable to intending planters if I give the names of those which I consider either worthless or only second-rate, and I shall begin with *Prince Albert* and *Beurré de Jonghe*: they both came across the water with fine characters, and I wish I had put them on the faggot-stack rather than on the south wall of the kitchen garden when they came. The same applies to *Bergamotte Soldat*, *Colmar de Schamps*, *Belle Faveur Nouveau*, *Bannax*, *Duc de Brabant*, *Comte de Flandres*, *Bezi d'Espere*, *Doyenné Crott*, *Reine des Poires*, *Prevoist*, *Beurré de Merode*, *Summer Franc Real*, *Madotte*, *Crot Castle*, *Belle Excellent*, *Beurré Gris Nouveau*, *Lindser Seul*, *Beurré d'Arenberg*, *Urbaniste*, *Bezi d'Espere*, *Althorp Crassane*, *Autumn Colmar*, *Vicar of Winkfield*, *Winter Crassane*, *Autonne Colmar*, *Easter Bergamotte*, *Beurré de Rance*, *Beurré de Capiaumont*, *Hessel*, *Beurré Langellier*, *Doyenné Siculle*. You will thus see that I have scratched exactly one-third of my hundred. There are exceptional cases, when some of these will come good, but I maintain that they are not to be depended upon for general planting. How seldom one meets with that fine old Pear, *Bezi de St.-Waast*; it is generally named *Bezi Vaat*, and is a great favourite with some. *Chaumontel* from a south wall is good, and comes in rather late. *Passe Colmar* is good any time, and grafted on *Williams' Bon Chrétien* is *par excellence*. *J. Rust, Eridge Castle.*

Plum, Peach (syn. *Large Peach, Reine Claude de Berger*).—As a really handsome dessert *Plum* of high excellence, and as one worthy of a place in the choicest collection, I can confidently recommend this variety. Knowing that the *Nectarine Plum*—a totally distinct variety—is sometimes confounded with the *Peach Plum*, I cannot do better than quote a very accurate description of it by that veteran pomologist Mr. Scott, who in his *Orchardist* very clearly and minutely describes it thus:—"Fruit large, roundish, inclining to oblate, marked with a shallow suture on one side; skin bright red, dotted with amber; flesh tender, melting, juicy, very sweet and luscious, separating freely from the stone; shoots smooth." An early dessert *Plum*. I would further add that it is a capital sort to grow on a north wall—i.e., in the South of England. It ripens about the end of July or beginning of August, and is almost a sure cropper. *J. Horsfield, Helyesbury.*

The Arboretum.

PICEA ENGELMANNI AND PICEA PUNGENS.—In the *Gardener's Chronicle* of December 24, 1881, p. 828, I notice a reference to the beautiful blue Spruce of the Rocky Mountains under the name of Picea Engelmanni. This is a mistake, which I have repeatedly met with. The Spruce in question is my Picea pungens, formerly [but erroneously] referred to P. Menziesii (= P. sitchensis), of the Pacific coast. The true P. Engelmanni is a second distinct species of the same mountain region, but occupying higher elevations. It forms extensive forests at an altitude of from 6000 to 11,500 feet up to the timber line, and a scrub above it. It has pubescent reddish branchlets, square leaves less sharply pointed, and small cones; its light cinnamon-brown bark is thin and scaly, and the leaves of young seedlings are smooth-edged. Picea pungens has white glabrous branchlets, stouter, in old specimens somewhat flattened, spiny-pointed leaves, blue in young trees and in the young growth of old trees; the cones are much longer and paler, the bark thick, crooked, and greyish; leaves of seedlings somewhat denticulate. It never occurs in forests, but is scattered along the banks of mountain streams at lower elevations than the other. Old trees become bare and quite unsightly, but the large pale cones in their tops are a very conspicuous feature. *G. Engelmann.*

TSUGA PATTONIANA AND HOOKERIANA.—Perhaps you will permit me to venture a suggestion in reference to two other West American Conifers which have occasioned a good deal of doubt, discussion, and hypothesis—I mean Abies, or properly Tsuga, Pattoniana and Hookeriana, which are also mentioned in the same page of the *Gardener's Chronicle*. Prof. Sargent and myself have visited Jeffrey's localities of Scott's Mountain, in North California (not Oregon) and the mountains south of Fort Hope, on Frazer River in British Columbia, connected with the Mount Baker Range. In both localities (as in many others near the timber line in Oregon and California) the beautiful Tsuga now known everywhere as Pattoniana, but in Edinburgh called Hookeriana—that with the angular leaves—abounds, with larger or smaller purple, or sometimes green, cones. On the northern mountains only, and not in California, and where the Edinburgh A. Pattoniana with flat leaves is said to come from, Tsuga Mertensiana climbs up to the same altitude as the other—smaller there, but otherwise undistinguishable from the seaside form. Now the leaf anatomy of the tree in the Edinburgh Botanical Garden, raised from Jeffrey's seeds, and cultivated there as Abies Pattoniana, is that of a true Tsuga, and cannot be distinguished from that of T. Mertensiana, as the figure of Prof. McNab in *Proc. Roy. Irish Acad.*, vol. iii., p. 23, fig. 2, under the name of Pinus Pattoniana, shows, and as I have myself found it in examining the Edinburgh specimen; but the original figure in the so-called *Oregon Committee's Report* is that of the angular-leaved tree called there A. Pattoniana, and now generally known by this name, or sometimes as A. Williamsoni. Now, is not the flat-leaved tree called in Edinburgh A. Pattoniana, the mountain form of Tsuga Mertensiana? This I suggest as a plain solution of the difficulty. The only objection seems to lie in the reported size of the cones of this species, which are said to be nearly of the size of what we now call Pattoniana, and much larger than those of Mertensiana; but may there not be some error or confusion about these cones? At all events I cannot distinguish the Edinburgh A. Pattoniana from T. Mertensiana, nor the small mountain form from the colossal seaside trees of this species, and I find no third species. *G. Engelmann, St. Louis, U.S.*

A NEW FIR.—Abies Eichleri is the name given to a Fir figured and described in the current number of the *Gartenzeitung*. It is a native of the Caucasus, and allied to A. Nordmanniana. The

following is a free translation of the description and history of it:—A tree about 100 feet high, symmetrically branched from the base; bark brownish-grey; leaves in two rows, or scattered all round, directed upwards, notched and rounded at the tip, furnished on the underside with two longitudinal bluish-white stripes; young shoots bluish-green; cones about 3 inches long by three-quarters of an inch thick, black-blue, cylindrical, rounded at the base; bracts obscurely toothed and provided with a short projecting point; scales distinctly stalked; seeds winged, the wing as long as the scales.

Abies Eichleri is one of the handsomest of the Firs. It is a fast grower, is perfectly hardy in winter, and as it does not start into growth before A. Nordmanniana it does not suffer from spring frosts. Seeds of this Fir were from Tiliis to the Royal Gardens, Potsdam, by Dr. Radde, about twelve years ago; only one seed grew, and until it fruited last year the plant was regarded as a form of A. Nordmanniana, from which it differs in appearance only in the white, brighter colour of the under-surface of the leaves and in the blue-green of the young shoots. The plant has grown into a fine specimen, about 10 feet high and 6 feet through; and last spring it flowered for the first time. Fortunately there was a plant hard by of A. Nordmanniana bearing young cones, so it was easy to observe the differences. Whilst the green cones of A. Nordmanniana were 6 inches long, and 2 inches thick, the black-blue ones of A. Eichleri attained only the dimensions given above.

The appearance of male and female cones at the same time permitted of artificial fertilisation, which has resulted in the production of fourteen well-formed cones. It is to be hoped that the seed will germinate, so that this fine species may be sexually propagated. Last spring a number of scions were grafted upon young plants of A. Nordmanniana, and they have all grown well. *W. R. Hemley.*

THE CHEMISTRY OF HORTICULTURE.—(THIRD PAPER.)*

By W. IVISON MACADAM, F.C.S., F.L.C., &c. (Lecturer on Chemistry and Analytical Chemistry, Edinburgh.)

IN the paper which I read before this Society last year we considered several of the classes of plants grown by horticulturists. You will remember that we considered more especially the Pelargonium, Fuchsia, Primula, Heliotrop, Begonia (partly), Cyclamen, Lobelia, and Dracaena; whilst this year we have Liliium, Hydrangea, Coleus, Verbena, and Petunia, and also very fully the Acacia, Aralia, Ficus, Grevillea, and Yucca.

Taking, then, the first series it will be found on looking at the table that in the Liliium the potassic oxide (potash, K₂O) runs from 24.728 to 27.206 per cent., and the sodic oxide (soda, Na₂O) from 15.081 to 11.545 per cent. The two oxides are found in the plant in combination with small quantities of chlorine as chlorides, and to a larger extent with sulphuric anhydride (sulphuric acid, SO₃) as sulphates. The remainder of the potassic and sodic oxides, when present in the fresh plant, is in combination with organic acids which are formed by the plant from the carbon of the carbonic acid present in the atmosphere, either directly or in its solution in rain water. These organic acids, when the plant is burned, are decomposed, and the oxides are found at the close of the operation as carbonates. The carbonic anhydride, as shown on the table, is very large, and is derived, as previously stated, from organic acids present in the fresh plants.

Of the ingredients present in the ash, and which are insoluble in water, but can be dissolved by acids, the most important are calcic oxide (lime, CaO), and phosphoric anhydride (phosphoric acid, P₂O₅). The calcic oxide is present in the Liliium in quantities varying from 8.741 to 11.225 per cent., and is partly in combination with the phosphoric acid, and in part also as organic compounds. The total amount of phosphoric acid ranges from 0.222 to 6.273 per cent. A portion of the phosphoric acid is in combination with some of the magnesian oxide, the remainder of this oxide being in combination with organic acids. The ferric and aluminic oxides are, as usual, present in very small quantities.

In Hydrangea the potassic oxide is only 12.619 per cent., and the sodic oxide 4.513 per cent., whilst the proportion of phosphoric anhydride is 13.328. The

calcic oxide is very high, 21.557 per cent., and is in combination mostly with organic acids.

Coleus shows a large proportion of potassic oxide, 30.795, with a small quantity of soda salts. The phosphoric acid is high, 15.654 per cent., and is mostly in combination with calcic oxide, of which there is 15.688 per cent.

Verbena has from 18.788 to 19.626 per cent. of potassic oxide, with 2.2 per cent. of sodic oxide, and from 5.4 to 8.9 per cent. of magnesian oxide. The phosphoric anhydride ranges from 13.40 to 15.07 per cent.

Petunia contains a very small quantity of calcic oxide—11.282 per cent., and a relatively large proportion of magnesian oxide—7.453 per cent. The phosphoric acid is also low—14.823 per cent.

These results, then, show that for the healthy growth of the Hydrangea only about a half the quantity of the potassic oxide is required that would be necessary for the life of the Lily, or about one and a half times less than that required for the Coleus. On the other hand, the Coleus requires much less calcic oxide in the form of organic salts than is required for the Hydrangea.

In the second series of plants submitted to investigation, namely, the Acacia, Aralia, Ficus, Grevillea, and Yucca, the results are given more in detail. With these plants three separate determinations have been made, first with the leaves, second with the stem, and thirdly, with the root. This system was adopted so as to learn whether any material difference could be observed in the mineral constituents of the various parts of the plant, for if such were the case, it might be possible to apply the materials which would aid the growth of the special part of the plant most desired; as, for instance, in the case of foliage plants, where the leaves are prized. The first constituents determined were the water, organic vegetable matter, and saline matter, and also the nitrogen present, the results being calculated as ammonia. The following tables give the results:—

Average Composition of the Leaf.

	Water.	Organic Vegetable Matter.	Saline Matter.	Solid Dry Residue.
Acacia lophantha	69.52	28.78	1.69	30.47
Aralia Sieboldii	74.71	23.15	2.63	25.78
Ficus elastica	77.73	20.43	1.83	22.06
.. rubiginosa	73.83	23.07	3.69	26.16
Grevillea robusta	71.48	23.39	2.31	25.51
Yucca aloifolia	78.68	19.01	2.31	21.23

Average Composition of the Stem.

	Water.	Organic Vegetable Matter.	Saline Matter.	Solid Dry Residue.
Acacia lophantha	59.72	37.04	1.33	30.97
Aralia Sieboldii	71.51	25.53	2.65	28.48
Ficus elastica	72.51	26.59	0.98	27.48
.. rubiginosa	75.37	23.44	1.48	24.63
Grevillea robusta	64.40	34.51	1.68	35.59
Yucca aloifolia	78.87	20.13	0.98	21.11

Average Composition of the Root.

	Water.	Organic Vegetable Matter.	Saline Matter.	Solid Dry Residue.
Acacia lophantha	67.05	31.50	1.44	32.04
Aralia Sieboldii	80.87	16.76	2.36	19.13
Ficus elastica	72.43	28.12	1.44	27.56
.. rubiginosa	71.02	26.42	2.55	28.07
Grevillea robusta	64.21	33.99	1.79	35.78
Yucca aloifolia	78.10	21.26	0.64	21.00

Percentage of Nitrogen given as Ammonia.

Acacia lophantha	0.77	Ficus rubiginosa	0.89
Aralia Sieboldii	0.59	Grevillea robusta	1.04
Ficus elastica	0.35	Yucca aloifolia	0.22

The figures show very yucca results with the various plants. Taking Acacia, we find that the largest percentage of water is in the leaf—69.52; that the root comes next with 67.05, and the stem is driest with 50.72 per cent. On the other hand, we find that Ficus rubiginosa has the largest proportion of water in the stem—75.37 per

* Read before the Scottish Horticultural Association at the meeting held on January 3.

cent.—while the leaf has 73.83, and the root 71.02 per cent. In Yucca the whole plant contains about 78 per cent.

In the proportion of saline matter there is just as wide a range of figures. Ficus elastica contains in the leaf 1.83 per cent., in the root 1.44 per cent., and in the stem 0.98 per cent.

In determining the constituents of the ash the same order has been kept up, and separate analyses made of each part of the plant. The figures are as follows:—

Chemical Analysis of the Ash of the Leaf.

Table with 10 columns: Compound (K2O, Na2O, CaO, etc.), and 10 rows of plant species (Acaecia, Acaia, etc.).

Chemical Composition of the Ash of the Stem.

Table with 10 columns: Compound (K2O, Na2O, CaO, etc.), and 10 rows of plant species (Acaecia, Acaia, etc.).

Chemical Composition of the Ash of Root.

Table with 10 columns: Compound (K2O, Na2O, CaO, etc.), and 10 rows of plant species (Acaecia, Acaia, etc.).

COMPOSITION OF THE ASH OF PLANTS.

Large table with 10 columns: Compound (Lithium, Hydrogen, etc.), and 10 rows of plant species (K, O, Na, O, Ca, O, etc.).

The effect of a growing plant on the composition of the soil surrounding it is very well illustrated by the two analyses given below. In the first case the soil was sampled before the plant was potted, and the second analysis is of the same soil after the plant has been growing in it for a considerable period. It will be noticed from the latter analysis that all the substances that can be said to be useful to the plant are greatly diminished. This is very evident in the case of the phosphoric anhydride, calcic oxide and potassic oxide. The results are the more interesting as they show the actual loss sustained by the soil even when every care has been taken to regularly feed the plant with artificial food, and proof is thus given that the subject has not yet been fully mastered, else the soil would have been found as good at the end of the experiment as at the commencement of the season.

Composition of Greenhouse Manure.

Table with 3 columns: Compound (Water, Organic vegetable matter, etc.), and 2 columns: Before use, After use.

The figures show how necessary it is to constantly replenish the soil with small quantities of the plant food. The more is this the case when the plants must of necessity be grown in comparatively small quantities of soil, as in our greenhouses. What the best food is to give the plants is the object of these investigations; as yet we are only beginning to get a few of the facts together which are necessary to start the operation—in fact, we are simply sifting out the land. The chances of a good return for our labour are very great; already we have such information as points to the direction that must be followed, and shows clearly that the various classes of plants etc., as we proceed with the analyses of their ashes, finding their way naturally into larger groups, each of which will have clearly defined properties and composition. Having determined these groups it will be a matter of ease to say what is the best manure to give to the members of the group so as to ensure a profitable return. It has been supposed that my desire was 'to have every gardener weighing out grain by grain the

proper materials for each plant, and that it was supposed that each potting-shed should have plenty of small bottles of the various simples arranged for use." I should like to know what we should think of a farmer were he to manure his fields indiscriminately with any one manure. What is desired is to let every man who professes horticulture have as thorough a knowledge of his plants as the farmer can have of his crops.

A point of some importance is that the mineral constituents of the plant must necessarily vary somewhat with the soil in which it grows. It will therefore be of great importance to have plants grown in various soils, and, from the combined results, come to an understanding as to the normal amounts of each ingredient present in the plant.

That these investigations are of use will be clear when I state that from the results given in my last paper, I, at the request of the Association, compounded a manure, which was placed in the hands of several of the most prominent members, and I am glad to say the results are far above what had been anticipated; not only has the manure been employed with the classes of plants for which it was intended, but other varieties have been experimented upon with good results. Amongst these may be mentioned Pinks, Pansies, Roses, Chrysanthemums, Pelargoniums, Fuchsias, Heliotropes, Petunias, besides Strawberries, Peas, Pines, Vines, Tomatoes, &c.

Another good result arising from the papers has been the drawing of attention to the enormous price demanded for the manures usually sold for greenhouse plants. The Gardeners' Chronicle, in an article on my last paper, declared its determination to test my statement as to composition and cost, and in their review of the year 1881 (p. 349, December 31, 1881) they say:—"The analyses of artificial manures undertaken at our suggestion has revealed the fact that, while some are excellent and none so far positively bad, yet the price asked for them is in almost every case so extremely high as to outweigh any profit from their use on any but the most restricted scale."

THE TORRENT REGIONS OF THE ALPS.

MR. E. MCA. MOIR has published a report of his visit to the French Basses et Hautes Alpes. He explains that the denudation of the hills-sides is partially due to the felling of the timber on the part of the herdsmen with a view of extending the available pasturage, partly to the flocks of goats. The winters are very severe, and the summers very hot, hence the melting of the snow and the rain tend to produce torrents, which create much mischief; to remedy this the Forest Department has undertaken several operations of replanting (reboisement) and the erection of weirs of stone (barrages), or of wattles (fascines, clayonnages), the construction of which is explained by the author. The works, wherever practicable, should be carried out at the sources of the torrents. As to replanting, the trees made use of are Ash, Poplar, Robinia, Maple and Elm, some of the transplants being at least 7 feet in height. The highest portions and the worst land are planted with two-year-old plants of Austrian Pine, each plant being surrounded with three or four large stones, which are said to have a wonderful effect in protecting the plants from the sun, and from being uprooted by the action of the frost, as well as in retaining moisture during the droughts of summer. In some districts Austrian Pine is planted even where the Scotch native pine soil, experience having shown that the Austrian Pine grows more rapidly than the Scotch. Sowing broadcast has been proved to be a failure, and the planting of small young trees before they have attained strength to withstand the rigours of the winter is also not recommended. After describing in detail his visits to various districts, including Mont Faron, near Toulon, where replanting has been successfully carried out, the author compares forest conservancy in France with that in India, pointing out the great advantages the French officials have in dealing with more intelligent subordinates and a more law-abiding population. The advantages of not transferring the forest officers from place to place are pointed out, so that the officials in charge of any district can not only initiate but supervise the operations for a series of years, while at the same time they are not hampered with the multifarious duties of the Indian forest officer, but can devote themselves much more uninterruptedly to their forest duties.

ROOT GROWTH UNDER DIFFICULTIES.

I SEND a root cut from the exposed mass of roots of a large Elm tree blown down by the great wind of October, 1881. The tree was in perfect health, and had attained a height of over 80 feet. It had evidently derived considerable support from the surface-soil, a superficial accumulation of about 2 feet formed of the decomposed stone of the middle lias. The roots,

sensitiveness and power of motion consequent on that sensitiveness possessed by roots during their growth, and in virtue of which they penetrate the soil and overcome obstacles. "Geotropism," or the growth of the root in a direction towards the earth's centre, manifests itself differently in the primary radicle from what it does on the subsequent root-branches. Sensitiveness to pressure also varies in the tip of the root and in the part immediately above it, as also does the sensitiveness to the moisture in

Orchid Notes and gleanings.

THE COOL ORCHIDS AT HEATHERBANK.—Mr. Wilson's garden at Heatherbank, Weybridge, is perhaps better known for its collection of hardy herbaceous and rock plants than as an Orchid-growing establishment, and if one dare suggest a quiet hint, it would be that the prestige of the former will sooner or later be eclipsed by the latter. One seldom hears or reads of an enthusiast in horticulture halting long between two opinions, sympathy generally gravitates towards one branch or another, but in Mr. Wilson's garden all is done well. There are little alpine plants outside one of the Orchid-houses looking as happy and comfortable in point of vigour as the healthiest *Odontoglossum* within the walls of the cool Orchid-house, but here the similitude ends. What a contrast when you enter the door of the Orchid-house! I think it was Mr. Fish who wrote something about a feast of *Phalænopsis* a year or two ago; well, here is a feast of *Odontoglossums*, and in a by no means extensive collection. Indeed the great merit of the collection lies in the fact that the largest number of the plants of which it is composed are in a vigorous flowering condition. The flowering plants consist of the following:—*Odontoglossum Kossii majus*, *O. Halli*, *O. triumphans*, *O. membranaceum*, *O. roseum*, a fine variety for cutting, and several distinct varieties of *O. crispum* (*Alexandrae*). One of the plants, bearing a compact but vigorous flower-spike, is very interesting, having six clearly defined spots upon each petal, which gives it a distinct appearance from other varieties of the same species. Another Orchid conspicuous for its beauty is *Pilumna fragrans*, which, as will be gathered from the name, is sweet-scented, and is as pretty to look at as it is agreeable to smell. I should have especially mentioned a finely grown plant of *Odontoglossum crispum* bearing two strong flower-spikes, with fourteen and thirteen flowers respectively upon each shoot. The same plant produced two stronger flower-spikes last year, with sixteen flowers upon one shoot and thirteen upon the other. Several fine plants of *Cœlogyne cristata* are in flower, as also *Dendrobiums*, of which *D. Picardi* is unusually vigorous and floriferous. *W. H.*

PERISTERIA ELATA.—I shall be much obliged if you will kindly inform me if anything is definitely known as to how this Orchid can be made to flower freely. We have here a large stock of plants, extraordinarily strong in bulbs and growth, but we have never seen a flower of it. Can the reason be that we give it a too rich soil? *George Kittel, Eckersdorf, Silesia.* [Give them a good season of rest after they have made their growth, and but little water during this period. ED.]

CŒLOGYNE CRISTATA.—Probably the largest and most remarkable specimen ever seen of this grand Orchid came under the hammer at Stevens' Rooms on Monday. It measured about 6 feet over, and bore upwards of 200 spikes of flowers. It was a fine variety, often having eight flowers on a spike, and, as may be imagined, was greatly admired by all who saw it. It was sent up for sale by a private grower, and was purchased, a bargain, by Mr. F. SANDER.

ORCHIDS IN EAST ANGLIA.—At Rendlesham Hall the following Orchids were lately found fully in bloom in that distinguished collection:—*Phalænopsis amabilis*, *grandiflora* and *Schilleriana* in quantity, many of them with very fine spikes, and also the more rare *Porteana*. The plants were in the most robust health, with fine leaves in number and length far exceeding most of those seen either in the trade or private collections. The following *Lælias* were also in bloom:—*L. anceps*, *L. autumnalis*, the chaste white *L. anceps Dawsoni*, also *L. albidia grandiflora*. A fine stock of the bright scarlet *Sophroneites* contrasted beautifully with the pure white *Madevallis tovarensis*. *Pleione humilis* was still in fine condition, while the pans of *maculata* must have been magnificent, and the pans of *Cœlogyne cristata*, studded with flower-stems, are nearly two yards across. The *Odontoglossums* were simply magnificent, *O. crispum* being finely in bloom; *O. Pescatorei* was also very fine, as was *O. tripudians*. *Odontoglossum Kossii* (*Warneri*) *majus* was also in splendid condition, as was the chaste, sweet-scented

FIG. 25.—OBSTRUCTED ROOT-GROWTH.

penetrating deeper, had struggled through a compact yet disrupted mass of stone, and the history of that struggle is well recorded in the specimen I send, and which shows a curious adaptive power, illustrated in clasping some of the opposing lumps of stone, and in contracting and enlarging according to the amount of resistance offered by the stony substrata. *W. Ingram, Belvoir.* [Our illustration (fig. 25) is a representation, much reduced as to size, of the root sent by Mr. Ingram, and with the lower end turned upwards, so as to save space. Our readers are familiar with the experiments and observations of Mr. Darwin on the

soil. The conjoint agency of these forces regulates the direction and forms of the root. ED.]

PICEA MAXIMOWICZII.—In this country, so far, this is a meagre, stunted bush, possessing no qualifications to enable us to recommend it to planters, but we notice that at one of those useful, practical discussions which characterise the meetings of the Massachusetts Horticultural Society, and which might most properly be imitated here, *P. Maximowiczii* is spoken of as "very desirable . . . close and compact in habit, with the foliage short and very rigid, and the under-side of the leaf quite glaucous."

O. pulchellum grandiflorum, with noble spikes of flowers. A noble plant of *Vanda cœrulea* was also in bloom, and several *Lycastes*. The health and cleanliness of the general collection of plants were all that could be desired—*Lælia*s, *Cattleyas*, *Dendrobiums*, *Acridies*, *Saccolabiums*, *Oncidium*s, all promising a rich harvest of bloom in their season. The collection is specially rich in *Cymbidium eburneum*, some of the plants being of great size, and all in the most robust health. But as the collection has been frequently noticed it may suffice merely to note those in bloom, and to say that the plants are in such splendid condition as must yield the highest pleasure to Lord Rendlesham, who makes Orchids his hobby, and that they reflect much credit on Mr. Mill, who has had them under his care for a dozen or so of years. *Violas*, *Gardenias*, *Eucharis*, perpetual *Carnations*, *Roses*, &c., are good as usual at Rendlesham, and Mr. Mill has still a good supply of late *Grapes*, while the early *Vines* are breaking so as to catch the late ones up if possible. The *Marie Louise* is the *Violet* group, and the many frames are sweet and fresh and full as the finest bank or bed could be in April. D. T. Fish.

RAISING ORCHIDS FROM SEED.—I have often pictured to myself the luxury in store for the enthusiastic hybridiser who shall have the good fortune to be placed in such a position as will enable him to carry out with spirit the hybridisation of Orchids. I was pleased to read Mr. Douglas's remarks on this subject. The crossing of Orchids opens a fine field for the skillful and earnest hybridist, but I have no doubt, as suggested by "H. C." (p. 49), it might be attended with some risk to the plants operated on, and looking at the rarity and immense value of some of the subjects alluded to by Mr. Douglas the owners of such treasures may well demur to subject them to such an ordeal. Is it impossible to establish hybridising establishments in the natural habitats of some of our grandest Orchids—in the homes, for instance, of the *Acridies*, *Cattleya*, *Cymbidium*, *Lælia*, *Lycaste*, *Odontoglossum*, *Phalenopsis*, *Saccolabium*, and *Vanda*. There are many other beautiful genera, but the above embrace many of our most gorgeous Orchids. [Such establishments are already in operation, under the management of Dame Nature. Ed.] The endless variety presented in some of these as imported, many of them differing only slightly from each other, arising from close breeding [I probably just the reverse. Ed.], and, no doubt, in some measure owing to a natural tendency to revert to the original type, but still presenting abundant evidence of their disposition to produce new forms from seed. In their natural habitats they would take more freely, the seed would, no doubt, ripen more perfectly, and would germinate more freely, and the young plants would flower at an earlier stage than they would under artificial treatment. Thus it would be possible to prove, in a comparatively short time, that which now occupies the time of a reasonably long life to accomplish. If it were possible to find security for such establishments there can be little doubt, if placed in the hands of persons thoroughly devoted to the art (it must be a labour of love), and possessing the necessary knowledge of the formation of the flowers and the mode of reaching the organs without injuring them—considerable knowledge is necessary—the results would be very gratifying, and in several of the enterprising firms who make Orchids a speciality there is no want of either means or spirit. In hot swamps, where many of our fine Orchids luxuriate, it might be impossible for Europeans to live comfortably for any length of time. But as their cultivation would require little attention during a great portion of the year, they might, except at the time of flowering and seed gathering, and sowing time, be placed under native supervision, so that collectors, if qualified to carry out this cross-breeding, could in addition to their work of collecting manage these establishments. In their natural state, as with us, there can be little doubt that the less they are disturbed the better, notwithstanding all that has been written regarding their cultivation. My experience with many of the most popular is, that when they got fairly hold of either pot or block, the grand secret is to leave them alone. And to the question frequently asked, "What do you do with your *Saccolabiums*, &c.," that they succeed so well?" my reply has been, "Leave them alone;" and I imagine to succeed with them in their native habitats would be to leave them as much as possible to Nature. Mr. Boxall, now collector for Messrs. Low, when a young man, acquired a considerable knowledge

of the mystery of Orchid hybridisation, and when he lived with me some fourteen years ago, he crossed and ripened seed of various kinds of choice Orchids. And looking at the many fine things he has sent home, his early love has not abated. If such an establishment as I suggest was placed in such hands, the result could not be doubtful. H. E.

THE FERNFIELD ORCHIDS.—Dr. Paterson had the following Orchids in flower at Bridge of Allan on January 24:—

<i>Angreum sesquipedale</i>	<i>Lælia superbiens</i>
(three spikes)	, <i>albula bella</i>
<i>Anchilistia</i>	<i>Leucis bicolor</i>
<i>Brassia Veitchiana</i>	<i>Lycaste Skinneri</i>
<i>Cattleya Veitchi</i>	<i>Masdevalla melanopus</i>
, <i>rubra oculata</i>	, <i>tovarensis</i>
<i>Cattleya Trianae</i> (fine)	, <i>amabilis</i>
, <i>Symeii</i> (grand var.)	<i>Neotia picta maculata</i>
<i>Celyne</i> sp.	<i>Odontoglossum cordatum</i>
, <i>cristata</i>	, <i>triumphans</i>
<i>Cymbidium sinense</i>	, <i>crispum</i>
, <i>Lowii</i> (three spikes)	, <i>mesium</i>
<i>Cypripedium Argus</i>	, <i>constrictum</i>
, <i>Domianianum</i>	, <i>Uro-Skinneri</i>
, <i>roosei</i>	, <i>Rossii majus</i>
, <i>Maulei</i>	, <i>hustoniense</i>
, <i>villosum</i>	, <i>Halli</i>
, <i>Eltonii</i>	, <i>pulchellum majus</i>
, <i>Pardunum</i>	<i>Oncidium orthotrichum</i>
<i>Dendrobium Farneri</i>	, <i>nubigenum</i>
, <i>Pierardii</i>	, <i>aureum</i>
, <i>fiatbatium giganteum</i>	, <i>Wicksoni</i>
, <i>Wardianum</i>	, <i>Kramerianum</i>
, <i>bigibulum</i>	<i>Omithidium sopheriitis</i>
, <i>aureum</i>	<i>Platanus fragrans</i>
, <i>Wallichianum</i>	<i>Pleione burdasi</i>
, <i>fiatbatium oculatum</i>	<i>Saccolabium giganteum</i>
<i>Epipedium fragrans</i>	<i>Sepidium sandiliora</i>
, <i>erectum</i>	<i>Vanda Cathartii</i>
, <i>speciosum</i>	, <i>lurva</i>
, <i>rhizophorum</i>	, <i>lunellata</i> Boxallii
, <i>clavate latifolium</i>	, <i>luteolor</i>
<i>Lælia anceps</i>	, <i>mesigena</i>
, <i>Barkerii</i>	<i>Zygopetalum Mackayi</i>

ORCHID CULTURE IN PORTUGAL.—Floriculture appears to have made considerable strides in Portugal during the last twenty years. The State, the King, and many private individuals have created glass-houses, and formed collections of exotic plants. We have now before us the second catalogue of the Orchids cultivated in the Jardim Real do Faço d'Ajuda, by Luiz de Mello Dreyner—a name that looks like a compound of German and Portuguese. It contains upwards of four hundred species and varieties, and as there are very few of the small-flowered genera, the collection is fairly rich in species of the showier class. The author mentions that the cultural directions in English and French works devoted to Orchid culture are not always suitable in the climate of Portugal. This, of course, one would naturally expect, considering the great differences in the climates.

Notices of Books.

British Fresh-water Algae, exclusive of the Desmidiæ and Diatomacææ: with coloured plates. By M. C. Cooke, M.A., LL.D., A.L.S. (Williams and Norgate.)

All students of fresh-water Algae will welcome this latest work of Dr. Cooke's unting pen and pencil. There is no English book on the subject of more recent date than Hassall's, and that not very satisfactory one appeared nearly forty years ago. It is true there is Kabenhorst's *Flora Europæa Algarum aquæ dulcis et submarinæ*: but that is written entirely in Latin, the figures are uncoloured, and the text is almost restricted to technical descriptions. The present work is written in English, and will appear in parts. The first part contains the Palmellacæ, and consists of twenty-eight pages of letterpress and eleven plates; and the second part is to contain the Protococccæ and Volvocinæ, with sixteen plates; to be followed by the Zygnemacæ in part three. Independently of the definitions of the classes, orders, families, genera, and species, this new work abounds in interesting notes and extracts; and the references are copious, directing the student to the more important literature. In addition to the author's own measurements, those of Kabenhorst and other writers are frequently given. The figures, as far as we can judge, are good, and those copied are duly acknowledged.

— *The Live Stock of the Farm* (Bradbury, Agnew & Co.).—This is one of the "Handbook of the Farm" series, edited by Mr. J. Chalmers Morton, whose name alone is a guarantee of accuracy and sound sense. The present volume consists of a series of chapters on cattle, dairy management, horses, sheep, swine, and poultry, treated by various writers. If the several subjects are not treated with quite the same fulness as in the case of the previously published *Chemistry of the Farm*, yet they are dealt with in a concise, straightforward way, which will commend itself to the agricultural reader.

The Kitchen Garden.

PLANTING AND SOWING.—Peas and Beans which were sown in pots and boxes the last week in December, and subsequently hardened off, will now be ready for planting in a warm and previously prepared border. They should be turned carefully out of the pots, and planted with a garden-trowel—disturbing the balls of mould and roots as little as possible in doing so—in rows 4 feet apart (which will be wide enough for the dwarf-growing varieties), and 1 foot asunder in the row. A little soil should be drawn up on either side the rows, after which a line of lime and soot should follow in the same direction, as also some short sticks to support the haulms. The sticks should be put sufficiently close on either side the rows of Peas to keep the latter in an upright position, and then some Spruce boughs stuck firmly in the ground on either side the row sufficiently close to protect them from frosts and cutting winds. As the Peas progress in growth, and become injured to the weather, the boughs should be gradually removed, which will prevent their making a weakly growth. And as soon as the weather becomes favourable enough for the purpose (towards the end of the current month), the boughs should be removed altogether, and the Peas be finally staked.

Beans should be transplanted individually in rows 2 feet apart and about 6 inches apart in the row; if for exhibition purposes, the rows should be 4 feet apart, and the plants from 10 to 12 inches in the row. Draw a little soil drawn up to the plants on either side then a line of lime and soot in the same direction, to protect the plants from the attacks of slugs. Should the borders in which the Peas and Beans (especially the former) are planted be facing due south—that is, running east and west—it will be advisable to plant the rows at an angle of about 45° from the wall to the walk, by which means the individual rows will be more directly exposed to the influence of the sun. Another sowing of Peas and Broad Beans, of the following or kindred varieties, should be made next week—viz., Laxton's Supreme, Culverwell's Telegraph, Carter's Telephone, and Carter's Stratagem Peas, and Seville Longpod and Taylor's Broad Windsor Beans. These will be found suitable for all purposes. Should the present spring-like weather continue, another planting of Cauliflowers and Cabbages should be made in the manner described in the Calendar for January 7, p. 16. Remove the Fern from young Lettuce plants that were pricked out thickly in a warm border in the autumn for transplanting in February and March on all favourable occasions, and *vice versa*. Of these, however, a planting may now be made in a warm border, over which a dusting of lime and soot has been previously strewn, in rows a foot apart, and the same distance in the row. For this purpose the plants in every other row in the nursery-bed above referred to should be taken up as required, which will then leave a space of 1 foot between the remaining rows, which again should be thinned out in the row as the plants are required.

ORDINARY WORK.—Stick autumn-sown Peas, if not already done, and run the Dutch hoe between rows of Onions, Spinach, Cabbages, &c. Hand-weed, sweep, and roll garden walks, and let neatness and cleanliness, together with good cultivation, be observed throughout this department. Pitted Potatoes should now have attention in the way of sorting and disbanding; and Jerusalem Artichokes should, where not already done, be taken up, sorted, and housed.

FORCING DEPARTMENT.—Thin out young Carrots growing on hotbeds to 2 inches apart in the rows, after which they can be thinned out as required for use. Transplant young Lettuce plants as soon as they are large enough to handle on a bed containing a gentle bottom-heat; and earth-up Potatoes on hotbeds as they require it with soil of the same temperature as that in which they are growing, and air freely on all favourable occasions. Tomato plants which are intended for fruiting in pots should now be shifted into larger-sized pots, using good loam and well-rotted manure, about three parts of the former and one of the latter, with a sprinkling of charcoal in potting them, and again place them near the glass in a forcing-house where the night temperature ranges

from 50° to 60°, and by day from 65° to 70°; and endeavour to keep a short jointed consolidated growth in the plants—conditions essentially necessary to the achievement of satisfactory results. Maintain a good supply of Mint, Tarragon, Mustard and Cress, also French Beans. The latter should be syringed twice a day, as a means of keeping the plants free from, and checking the attacks of, red-spider, to which they are subject when grown in artificial heat if not judiciously supplied with water. Pinch the points of the shoots out of successional plants to make them branched and top-dress with rich soil. For early work we grow a variety of our own—something after the habit of *Ne plus Ultra*; but our next and subsequent sowings will be made of Canadian Wonder—the best all-round French Bean in cultivation. *H. W. Ward, Longford Castle, Wilts.*

NOTES ON VEGETABLES.

CELERY COLONEL CLARKE'S RED.—After trying various sorts of Celery, I have for the past two seasons planted none but Colonel Clarke's Red [syn. Leicester Red], which undoubtedly combines every good quality requisite in a Celery of the highest excellence. It has been in use here during the past four months, and we still have some 500 plants, few of which have as yet shown the slightest tendency to flower, proving at once that this may not only be considered a good early sort, but suitable for cultivation as a late kind also. *A. L. H.*

CHAMPION RUNNER BEAN.—This is decidedly the best type of Runner Bean with which I am acquainted, and I commend it to the notice of those of your readers who have not already grown it. It is highly prolific, grows to a good size, is very tender, and of a beautiful colour; this latter quality, from a marketing point of view, is rather an important one, and will doubtless cause it to become the leading variety grown for that purpose. *H. J. H.*

The Hardy Fruit Garden.

DIAGONAL ESPALIER TREES.—It is universally admitted that large Apple and Pear trees are very objectionable in vegetable gardens; and it is really, in most instances, quite unnecessary to have such trees there, as abundance of fruit of the finest quality can generally be grown on low pyramidal-trained trees; or on trees trained in the form of espaliers, which will throw no appreciable or injurious shade upon adjacent crops of culinary vegetables of any kind. And if such trees are properly managed they are exceedingly ornamental, as well as useful. One of the prettiest among the many pretty objects in the beautiful gardens of Hardwicke, near Bury St. Edmunds, during the past season, was a long line of diagonal, or diamond-trained Apple trees, which extends to the entire width of the kitchen garden, or from the east to the west side. The rail or fence to which the trees are trained is formed of strong wire, and is just 5 feet high. The trees when planted were all maidens, in most cases with one strong shoot each, so that they were planted in pairs; and the shoots laid in at full length, one to the right and the other to the left. The pairs of trees were planted 30 inches from each other, and none of the shoots were cut back, as the object was to complete the espalier in the shortest possible time. And this was fully accomplished in two years, and has proved to be in all respects a most complete success, bearing fruit so early as the second year after being planted. They have now been planted some four or five years, and the espalier is in all respects complete, no portion of the wire being visible, and from one end to the other at the time I saw it (end of September) it was covered with fruit of the finest quality, and was a sight not likely soon to be forgotten. It must have been an exceedingly profitable as well as a very ornamental object, comprising as it did an extensive collection of the very best kinds of dessert as well as culinary Apples—the latter occupying the eastern portion of the espalier, while the stable sorts occupied the western portion of the same, among which I particularly noticed Scarlet Nonpareil, a very handsome, high coloured, fine flavoured variety; Old Nonpareil, Bradick's Nonpareil, Adam's Pearmain, Lambi Abbey Pearmain, Cornish Gilliflower, Court-pendu Plat, Cox's Orange Pippin, Dutch Mignonne, Golden Harverg, Golden Keinette, Kerry's Pippin, Sam Young, Margil, &c.; and among culinary sorts, Cellioi, high coloured and very fine; Beauty of Kent, Blenheim Orange, Cox's Pomona, Dumelow's Seedling, D. T. Fish, Hawthornden, Jolly Beggar, Keenish, Filthasket, Bess Pool, Golden Noble, Lord Suffield, &c. *P. Grieco.*

Peaches and Nectarines.

EARLY PEACH TREES have come on very fast this season. The fruits on our earliest are larger than horse Beans, while this time last year they were scarcely set with treble the amount of fire-heat that they have had this year. Continue disbudging until all the trees are finished. By this time some of the longest shoots will be ready for heeling down, and if handsome well-shaped trees are wished for it is very essential to do this when the shoots are young. Always select the best placed shoots nearest the base of last year's wood; any terminal shoots that are intended to be taken out after the fruit is ripe may be stopped in close. Use the syringe freely, and should greatly make its appearance fumigate at once. Where the fruits have set thickly they may now be thinned, leaving the largest and best placed fruit, always leaving plenty on to allow for dropping during the stoning period, some varieties dropping their fruit at that time much more than others, which latter thin accordingly. Treat second and third houses as advised for early house in former Calendar, giving abundant supplies of chilled water at the roots whenever they require it. Any trees in late houses that it is desirable to move, or that require root-pruning, if not done, should be completed as soon as possible. *J. Wallis, Kew Gardens.*

Cucumbers.

EARLY CUCUMBERS WITHOUT HOT-WATER PIPES.—Cucumber growing in houses of modern construction has not been a difficult matter this winter, owing to the mild weather, but there is always more or less risk incurred in attempting to force Cucumbers in hotbeds during the early spring months, the great drawback being the loss of heat from the fermenting materials for want of some method of preventing its escape. A simple way of getting over the difficulty, and one that answers well, is to run up a slender brick pit with 4½-inch brick walls the requisite height, say from 5 to 6 feet high at the back, giving a good fall to the front in order to catch a maximum of sun and light, which is of the first importance to Cucumbers early in the season.

The walls should be strengthened according to their height, and the pit should be high enough to admit of a door being introduced at one end, otherwise it will be little better than the ordinary hotbed, which is a great middle, and a constant source of annoyance to gardeners during unfavourable weather. The path would run parallel with the back wall, where a shelf could be erected for forcing French Beans or other plants requiring the same temperature as the Cucumbers. There is then the body of the pit to be disposed of to the best advantage, which would be done by enclosing the whole space by a wall 3 to 4 feet high, the whole length of the pit running flush with the path. Cross walls should then be built at distances of about 3 feet apart, and "pigeon-holed," and the pit is complete. The next operation would be to fill every alternate space divided by the cross-walls with fermenting materials raised to the proper height, and then to add the mounds of soil for planting. When the heat is found to be declining, the empty spaces are filled with fresh materials as often as is found necessary, and the moist heat generated is conserved for the benefit of the plants. Only half the materials used for a hotbed and half the labour will be necessary to grow Cucumbers satisfactorily in this way, and, what is more, there need be no "break" in the supply, as in case of one set of plants growing exhausted, a second lot may be brought forward to take their place, and be in full bearing before the exhausted plants are removed. *Cultivator.*

Grapes and Vineries.

THE DUKE OF BUCKLEUCH GRAPE AS A STOCK FOR FOSTER'S SEEDLING.—About four years ago I inarched a shoot of Foster's Seedling on the Duke of Buckleuch Grape. This is now a nice rod, and growing close to it are two Vines of Foster's Seedling on their own roots, and one rod inarched on Burchard's Prince. They are growing in the same border, and all receive the same treatment. Burchard's Prince being a robust grower, I expected the Grapes from the rod inarched on it would be an improvement on the others; but I could not perceive any difference

between them and the Grapes from the Vines on their own roots. The rod on the Duke of Buckleuch stock, however, bore a good crop last season, and the Grapes were a great improvement on the others, the berries being larger and of a much finer colour, and the Grapes were ripe from two to three weeks earlier than the others. The difference in the appearance of the Grapes on the Vines was very striking. The Vines are now breaking, and I hope in a few months to see if the improvement is maintained. *M. Saul, The Gardens, Stourton Castle, Yorkshire.*

KEEPING OF LATE GRAPES.—Our experience in this matter is quite contrary to that of Mr. Douglas—p. 83—as we have never found them to keep better, in fact that would be almost impossible, as we have not cut a dozen mouldy berries out of our latest house, which is 80 feet long. This is partly owing, perhaps, to the very favourable weather we had when they were ripening, which enabled us to finish them with plenty of air and a minimum of fire-heat. *W. H. Dives, Bursley Park.*

Plants and their Culture.

POTTING STOVE PLANTS.—This indispensable operation should now be thoroughly gone into. To meet certain cases a few plants may have been potted occasionally, but it will now be advisable to closely inspect the entire collection. Secure sufficient soil for this purpose where it can get somewhat warmed up to the minimum temperature of the house. Cast off the fine and close refuse from the peat, and if the loam is of too tenacious a nature, or rather on the wet side, mix some old mortar rubbish with it. In potting give healthy-growing stuff a size larger pot, if possible, but reduce any that may be up to their full size, and all such plants as are yearly pruned into the hard wood. Always make it a practice to remove any soil to which the roots have not taken themselves freely. Do not increase the size of pot in the case of any plants that are sickly, but rather reduce to a smaller size; better still, dispense with them entirely where possible, and grow on others. Experience conclusively proves to me that Palms are more frequently over-potted than they should be. They retain a fine healthy and vigorous growth in far smaller pots than many imagine. Give stimulants and water freely, instead of potting so often, and a better result will be gained.

When the potting process is going on take the opportunity to inspect all climbers that may be turned out into beds of soil, and remove any sour matter, and top-dress with fresh soil. Take the opportunity also of turning out any fresh ones where there may be room for them. Before the plants are re-arranged give the interior of the house a thorough cleansing. Be cautious with watering for a few weeks, and perform the same as much as possible with a fine rose attached to the can. Increase the temperature slightly, more especially in the daytime; keep a nice healthy growing atmosphere of 65° for night temperature, and rising 15° and 20° during the day when the sun is shining.

FORCING DEPARTMENT.—Regular supplies at frequent intervals should be introduced; the mistake often made is in prolonging the intervals to too great a length; a few things at a time, and often, is better economy, giving a more regular supply of flowers with less waste.

GREENHOUSE.—Seed should now be sown of Rhodante for early blooming, likewise of Mignonette, to succeed the autumn-sown stock. A pinch of Stock seed (Ten-weeks) should also be got in to follow in like manner. Propagate the necessary supply of plants bearing sweet-centred flowers and foliage; of the former such as Heliotropes and Tree Carnations, of the latter *Alyssia citriodora*, and the various scented-leaved Pelargoniums, are most useful. An early batch of Bouvardia cuttings struck now would give a good return early in the autumn. Of Fuchsias some cuttings should also be got in as soon as possible, and old stools be shook out and re-potted when commencing to break freely. *James Hudson, Currier's-bury House, Aton.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Feb. 6	Sale of Plants from Ghent, &c. at the Auction Mart, by Protheroe & Morris.
WEDNESDAY,	Feb. 8	Sale of Established Orchids, Hardy Plants and Bulbs, at Stevens' Rooms.
THURSDAY,	Feb. 9	Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY,	Feb. 10	Sale of Imported Orchids, at Stevens' Rooms.

IN offering PRIZES FOR THE LARGEST POTATO of a given kind the Messrs. HOOPER will probably elicit no inconsiderable amount of unfavourable, and not altogether unjustifiable, criticism. Of course, prizes for the biggest bunches of Grapes, the largest Melons, the longest Cucumbers, the heaviest Cabbages, &c., or even the most gigantic Gooseberry, may be all right, but to offer prizes for the biggest Potato is rank heresy. It may, however, serve to throw oil on the critics' perturbed waters if we mention that the donors of these prizes are not anticipating any very great national benefit to result, neither, we believe, do they expect that there will be in consequence a flow of golden coin into their pockets—indeed, it removes the gift from the region of the heroic when we learn that the Messrs. HOOPER are really trying to promote a bit of fun, an amusing incident in the humdrum of our prosy lives. Prizes are given all over the kingdom for the handsomest Potatoes, and really we see myriads through the season so handsome and so perfect that they become monotonous. They are of their kind fine—so very fine, in fact, that we almost sigh for something that is ugly or big, or for some new and novel form as a foil to so much excellence. The Messrs. HOOPER propose to supply this. We hope in the spirit in which they are offered they will be accepted, and that, keeping up the fun of the thing in earnest, some scores of big samples of the Queen of the Valley Potato will be presented at South Kensington next autumn. Queen of the Valley is not a beauty certainly, she is too Brodingnagian in her proportions, a sort of regal giantess, but she is enormously productive, and the Fruit Committee of the Royal Horticultural Society have, it may be presumed, in granting to her a First-class Certificate, testified that her table-merits are good. Naturally productive of large tubers, yet those who may aspire to win the prize will do well not to trust too much to ordinary lines of culture. A large seed tuber cut up to sets having single eyes, will make for the purpose the most promising sets, and each root should have but one stem. In this way two or three giants may be found, instead of the customary eight or ten of lesser size. The Messrs. HOOPER advise budding philosophers to quit their airy nothings and betake themselves to the planting of large Potatoes. To plant big ones needs little special judgment or wisdom, we prefer to ask them not so much to "plant" as to "grow" big ones.

But although this Queen of the Valley is one of the present season's Potato novelties, it is by no means the only one, and from a show point of view there are not a few new sorts that are some way her superiors; indeed, a fellow importation from the United States, the Adirondack, is superior, and will probably take a higher position as an exhibition tuber. This kind, too, has taken a First-class Certificate at Chiswick, so that it has a good reputation for quality. It is of a flattish round form, a shape characteristic of American kinds, has a somewhat rough netted skin, which is of a pale red colour, whilst the eyes are of a deep carmine hue. In this same section, that of coloured rounds, probably the handsomest of the new-comers, and not least, a beauty amongst the old ones, is that very pretty pebble-round kind named Reading Russett; its colour is bright red, and its flesh, when cooked, first-rate. We have so many good coloured rounds that something quite superscellent is needed to

match with Matchless, Vicar of Laleham for good looks, Radstock Beauty, Grampian, and Beauty of Kent; and we think when we put Reading Russett with these we select some among the best coloured rounds good for show and good for table that we have. The season, however, has not been very productive in *bona fide* new white rounds, and somehow it happens that this section is about the weakest. The new Fifty-fold seems to be the most promising, because it gives us fair size with fine quality. Some other new white rounds are better suited for the frame or early border, the tubers rarely taking on show size. Knowing something of its qualities before it got into commerce we think it may fairly be classed with Schoolmaster, Bedford Prolific, Reading Hero, and Porter's Excelsior as among the best white rounds for exhibition we yet have in commerce.

In the section of coloured kidneys two kinds stand out as valuable additions. Prizetaker Kidney, another First-class Certificate kind, is a fine handsome red variety, a Bountiful in form, cropping, and quality, but about twice the size. Growers of this will, we think, have no occasion to complain that they can't get size into it. Then we have the pale purple hued Defiance, a handsome long flat kidney, a wonderful cropper, and of good quality. This will make a telling exhibition variety, and these two kinds, with Mr. Breese, which is indifferent for eating purposes, American Purple, Beauty of Hebron, and American Rose, are among the best in the opinion of the "fancy." Some will no doubt think Trophy should have been included, but Trophy is not very desirable, in spite of the certificate it got at Chiswick. In English coloured kidneys we are yet weak, such sorts as Bountiful, Purple Ashleaf, Crimson Ashleaf, and Princess of Wales, seldom showing good samples. The Americans are strongest in coloured sorts, and it is to be hoped that we shall soon remedy that defect, for few of the American sorts are really first-class table kinds.

There are two or three notable new additions to the white kidney section, the most prominent of which is Cosmopolitan, a First-class Certificate kind at Chiswick and one that should universally take on the show table the premier position hitherto held by International. Cosmopolitan is much earlier, it comes as large and handsome, whilst its table quality is good. Duke of Albany resembles the Beauty of Hebron, but it has a white skin and if it always exhibits the fine handsome form shown in the samples sent out it will make a popular show kind. Victor is handsome but evidently too small. It is really a frame or border kind. Cleopatra is a large flat kidney, something after the King of Potatoes form. It has also received a First-class Certificate at Chiswick, so that it comes to us well recommended. It is handsome and promising. From Scotland comes a large flat kidney named Cromwell, that has a good reputation and is a great cropper. As seen so far it bids fair to make a show Potato. We take the best six white kidneys for exhibition to be Cosmopolitan, Woodstock Kidney, Pride of America, Covent Garden Perfection, Advance, and Duke of Albany.

In writing so much we have had in view the exhibition table as at present constituted. If we were dealing simply with other and, as we think, more important qualities, our selection would be considerably different.

—THE PAST MONTH.—January has been a most interesting month, having given us neither fierce frost nor snowstorm, nor, indeed any event of meteorological importance, beyond occasional heavy fogs and unusually high barometer. And yet gardeners, and, indeed, all concerned in horticulture, have good reason, in the very monotonous character of the past month, to remember it for a long time, and that with satisfaction. In spite of all our professed repugnance to what we will call unseasonable weather, there can be no doubt that a mild, open January is better than is a cold, frosty one.

The benefits resulting from a month so open and of such an even temperature have been immense. We have not had a day's hindrance to work, and in gardens everything has gone on as if it had been October or April. Of special benefit has such a pleasant season been to horticultural trade, for planting of all kinds has gone on with singular comfort and ease; indeed, the winter so far has been a sort of planter's millennium, and if the most has not been made of a midwinter almost unparalleled in human memory, the fault will lie with the planters, and not with the season. Not only has the weather been so open, but it has been dry. Excepting during long spells of frost it is long since we had such a rainless January, and soils that were at the opening of the year saturated with moisture have become friable and working in the most satisfactory condition. We cannot expect so pleasant a time long to continue; the present month may be wild and stormy, but it can hardly be marked by prolonged severity.

—THE GREAT YORK GALA AND HORTICULTURAL FÊTE.—The schedule for the twenty-fourth annual exhibition of this Society is now ready, and the exhibition for the present year takes place on June 14, 15, and 16. Very liberal prizes are again offered for plants, there being also two classes for groups arranged for effect. The annual exhibition at York always brings out a first-class display of Pelargoniums grown in the style made popular by Mr. CHARLES TURNER and the other old Pelargonium growers many years ago, and this part of the exhibition alone is a great feature. Roses in pots, as well as in a cut state, have liberal encouragement, and for the first time at York good prizes are offered for a "table for dessert, 8 feet by 4½ feet, completely laid out for ten persons, and arranged so as to show the best means of utilising fruits and flowers in its adornment." About £50 is also given in prizes for fruits, and there is invariably a good display. The Society is in a flourishing condition, and has about £1600 in the Funds.

—FIRE IN A HORTICULTURAL BUILDERS PREMISES.—On the evening of January 26 the workshops of Messrs. MAKENZIE & MONCUR, horticultural builders and hot-water engineers, Upper Grove Place, Edinburgh, were burnt to the ground, loss being sustained, it is stated, to the amount of £7000 or £8000. The establishment consisted of two three-storey buildings, one of them about 230 feet long by 36 feet in breadth, and the other about 60 feet long by 20 feet in width; and the fire spread with such great rapidity that the workmen had not time to save their tools. A large stack of wood was also destroyed, and for several hours the western portion of the city was brilliantly illuminated. The loss is covered by insurance.

—PHYTOLACCA DEBANDRA IN NEW JERSEY.—A contributor to COULTER'S *Botanical Gazette* states that a plant of the Pokeweed attained extraordinary proportions last summer in his garden at Freehold, N.J. It threw up ten stems, nine of which averaged to feet in height. The sight presented by its beautiful cylindrical racemes of purplish berries is said to have been very fine. The writer estimated the quantity of fruit at a little more than a hundredweight. Over 1800 racemes were counted. In October the robins were feasting daily upon them, and the writer feared they would leave none for the snowbirds. This robin, by-the-by, is not a true robin, being more akin to our thrushes than to our robin.

—A NEW FERN FROM ARIZONA.—Woodson Plummer is the name given to a "lovely Fern" described in COULTER'S *Gazette* by J. G. LEMMON. It is dedicated, we are told, "to Mrs. LEMMON, whose maiden name was SARA A. PLUMMER, and whose devotion to science, arduous labours, and daring heroism while botanising in the land of the Apache, entitle her to high honours and this timely recognition." We hope that the Fern is worthy of the honour. There can be no doubt of the lady's merits, though her husband prefers commemorating her maiden condition. This Fern differs, it is stated, from *W. obtusa* in having bright green, almost diamond-shaped fronds. The pinne are not remote, except the lowest, but approximate, not obtuse, but long attenuate from a broad base. The segments are longer, narrower, and with more teeth, all conspicuously ciliated with stalk glands, as are also the lobes of the indusium.

FIG. 26.—BOMAREA VITELLINA. (SEE P. 143.)

— PARASITISM OF EPITHECUS VIRGINIANA.—This plant, an ally of our Broomrape, is common under Beech trees, parasitic on their roots, in the Eastern States of North America, where it bears the names Beech-drops and Cancer-root. S. T. FERGUS describes its mode of parasitism on its nurse plant in COULTER'S *Gazette*. "The Beech root," he says, "on being touched by the parasite, sends a branch or branch-like growth into the latter, through which all its nourishment is carried, causing the death of the root from this point to the end, if not too large, while that above flourishes despite the drain of the parasite. If, however, the root is larger, and there is substance enough after the parasite is supplied, it will live, but will be retarded in its growth." If this is what the writer intended to say, and at the same time true, the benevolent Beech trees of America voluntarily support parasites, and even go out of their way to make them comfortable!

— EARLY AZALEAS.—At no season of the year are the rich colours of the Azalea more welcome than during the first months of the year, when there are so few flowers to rival them for all ordinary decorative purposes. At the Oak Hill Nursery, Suburbion, there is now a good show of early kinds, including Bernard Andréas alba, semi-double; Raphael, also a semi-double, white; Apollon, a beautiful flower, with pink stripes; and Madame Van der Cruyzen, a charming pink semi-double kind; all of which are useful for cutting, and will last over a week in a cut state in fresh water.

— BLACKBIRDS AND SLUGS.—In a short article entitled the "Blackbird in the Garden" (*ante*, vol. xvi., p. 782), it was inadvertently stated that all practical gardeners are aware that if the blackbird makes free with ripe fruit at one season of the year, at another it devours large numbers of slugs, snails, and other vermin, &c. Several correspondents have questioned, and justly, no doubt, the accuracy of the statement that blackbirds eat slugs; and one has gone so far as to suggest that they are not particularly partial to snails. As far as slugs are concerned the statement was made from the writers' observation, but the writer has often witnessed blackbirds breaking snail-shells on stones and extracting the snails.

— GARRYA ELLIPTICA.—This beautiful evergreen shrub is now to be seen in fine condition in the grounds of Somerley Park, growing in a fringe of scrubbery, and displaying its charms in a very attractive manner. The evergreen branches are freely adorned with long, slender, pendulous catkins, which make a most showy and elegant appearance. Were it growing against a wall in the most favoured position, it could scarcely be more advantageously displayed than in the open in the picturesque grounds of Somerley Park. And yet, remarkable and valuable as it is, how seldom, comparatively, is it met with! It will grow well in common soil—it does not need a rich one; and it will succeed against a wall where it will not thrive in the open air.

— THE BOTANY OF CENTRAL AND NORTH-EASTERN ASIA.—We have before us two recent contributions to the botany of Central Asia, namely, *Descriptions Plantarum Novarum et minus cognitarum: fasciculus viii., auctore E. REGEL; et Diagnoses Plantarum Novarum Asiaticarum: iv., scripta C. J. MAXIMOWICZ*. The former is supplemented by an index of localities; by some general observations on the flora of Central Asia; by tables showing the distribution of the Juncaceæ, Cyperaceæ, and Gramineæ of Turkestan in particular; and by a map on which are traced the routes of the travellers A. REGEL, FEDTSCHENKO, KAULBARKS, KUROPATKIN, OSTEN-SACKEN, KRZEWALSKI, and SEWERZOW. The elevations are approximately shown by shading. The descriptive part of REGEL'S work is almost entirely devoted to the three natural orders mentioned above. A very striking feature of the flora of Central Asia is its poverty in sedges, grasses, and rushes. The numbers of species in Turkestan are:—Juncaceæ, 15; Cyperaceæ, 81; Gramineæ, 195; 17 of the Cyperaceæ and 34 of the Gramineæ are peculiar to Turkestan. In his general observations Dr. REGEL alludes to the comparatively recent upheaval of Central Asia—a theory confirmed by the vegetation. Not a single species of Rhododendron or Liliium has been found in Central Asia, whereas both genera are numerously represented from the Altai to Eastern Europe, in the great dividing ranges

of mountains. On the other hand the genera Tulipa, Allium, Eremurus, Elymus, &c., and especially the Salsolaceæ, have their greatest concentration in Central Asia. Rye, Secale cereale, we are told, is indigenous; and Hordeum Kaufmanni is a new species of barley, found in West Turkestan, that is likely to be added soon to our cultivated cereals. The following is a complete list of the new species described, and now cultivated in the Botanic Garden, St. Petersburg:—

ALLIUM OSTROBKIANUM, Regel, Western Turkestan.
SITICATUM, Regel, Sarawshan Valley.
SUWOROWI, Regel, near Uralsk.
COLICUS HUBERI = Salvia Schimperii, Abyssinia.
CRINUM SCHIMMELI, Regel, Natal.
DELPHINIUM CORYMBOSUM, Regel, mountains of Eastern Turkestan.
GENTIANA KESSELENGI, Regel, mountains of Eastern Turkestan.
HELICOPHYLLUM LEHMANNI (Aroidæ), Regel, Western Turkestan.
LONICERA ALBERTI, Regel, Eastern Turkestan.
MERENDERA RAIBEDANA, Regel, Caucasus.
STATICE SUWOROWI, Regel.
TANMATEUM LEPICOPHYLLUM, Regel, Eastern Turkestan.

MAXIMOWICZ'S *Diagnoses* are chiefly of plants from North-eastern Asia, and they are not limited to previously undescribed species. In many instances all the species of a genus inhabiting that region are reviewed or described. Thus—Hypericum, sixteen species; Eonymus, seventeen species; Chrysosplenium, thirty-nine species, with the exception of two in South America, restricted to the northern hemisphere, and mostly to Asia. One species, *C. alternifolium*, is generally diffused in the northern hemisphere, including some parts of the arctic regions. Of the rest, thirty-two are peculiar to Asia, two to North America, one to Europe, and one is common to Europe, Asia Minor, and the Caucasus. Altogether thirty-four inhabit Asia, the greater part China and Japan. Four new species of Primula are described, and a new genus of Primulaceæ, Pomatosæ, allied to Androsæ. Several additional Pedicularis are described, two of Kenigia; and there is a dichotomous key to the Chinese and Japanese species of Ficus constructed from the habit and the character afforded by the vegetative organs. Finally, there are figures of *Acer pilosum* and *A. discolor*.

— MARKET POTATOS.—Political economists are doubtless noting with satisfaction the important fact that Potatos are now cheaper and more abundant in the country than they have been for several winters, so much so, in fact, that growers grumble greatly as to prices, not so much because of foreign importations as for the reason that Potatos are so plentiful at home. That this abundance should happen after what was in many parts a somewhat disastrous season, because of the autumn rains, is remarkable, and is chiefly due to the immense breadths of such robust kinds as the Champion and Magnum Bonum being planted, and these have produced enormous and healthy crops. But there is yet another reason for this cheapness, and it is found in the unfavourable light in which these two kinds are regarded in the market. It is of no consequence that they so largely resist the disease—a matter to the grower of the first importance; the fact remains that the Magnums are of inferior quality, and the Champions, though good cookers, are so ungainly and deep-eyed as to be wasteful and regarded with disfavour. Were the immense bulk of Potatos good sound Victorias there would be no complaint as to price or of too great abundance, and although this latter fine kind, even at its best, does not rival either the Champion or Magnum Bonum in the production of crops, still the lifting, storing, and marketing of the one is as costly as the other, and the profits are far less. It, therefore, becomes evident that we cannot rest satisfied with the coarse market kinds now so largely grown, and raisers may find an ample field open to them to produce such sorts as, whilst equal to the Victorias in quality, shall rival the Champion in health and productiveness. From a cultural point of view there is much room for improvement, because both Magnums and Champions are great soil exhausters; and great as are the root crops, they are by no means equal to the top growths. Sorts that will produce these big crops with one-half the top growth and a month sooner are much needed.

— TRITOMA GRANDIS IN FLOWER.—If things go on as they are, there will soon be reason for draw-

ing up a heavy indictment against the Clerk of the Weather. When plants that flower in the early autumn are found in full beauty at the end of January it certainly looks as if Nature was growing somewhat erratic in her plans. The plant in question is the earliest variety of its kind and as seen in the nursery of Mr. D. S. THOMSON, of Wimbledon, at the present time, is a remarkable illustration of the mildness of the weather. Spring flowers coming in a month before their time is perhaps not so great a wonder to a good many as autumn plants flowering—one may almost say between winter and spring. The fact is, a great many plants have made second growths, and are consequently flowering a second time, but it is not difficult to distinguish between the flower of an after-growth and that of a plant which has only been awakened into activity a little before its proper season by the mild weather. In Mr. THOMSON'S nursery there are hosts of spring flowering plants surrounding the group of Tritomas referred to, which are coming into flower much earlier than usual, but any one having the least knowledge of plants can hardly fail to discern the vigour of the former as compared with that of the latter. The only mischief that is likely to follow cases of this kind is that autumn-flowering plants which have been kept in a state of greater or less excitement when they should have been at rest will flower less vigorously at the right season, unless, indeed, they sustain further injury from severe spring frosts which cannot at present be taken into account. Valuable plants should, in the event of such a contingency, be protected with dry Bracken, or, failing this, thick Scotch Fir branches, either or both of which should be got in readiness before the evil day arrives.

— THE CAUCASIAN LAUREL.—The late severe winters which have decimated whole collections of plants and shrubs in various parts of the country have at least done some little good in attesting the hardiness of certain varieties of trees and shrubs which will materially assist planters in making their selections in future. Laurels were badly cut up in many places—in some cases severely—except the Caucasian variety, which is weather-proof anywhere. Those who wish to cover unsightly banks where grass will not grow have in this plant something that will not only clothe such naked places, but make them pretty and cheerful looking at all seasons. The variety is of dwarf growth, and will live anywhere if plants will live at all.

— SPARMANIA AFRICANA.—This fine old greenhouse shrub, that in an ordinary conservatory flowers freely at this season of the year, is now so seldom met with that there is great danger of its being almost lost to cultivation; in this respect going the way of many other useful things that have become neglected. A specimen in the conservatory at Hanger Hill House, Ealing, the residence of E. M. NELSON, Esq., is now flowering freely, its attractive spikes of flower demonstrating a bold leaf-growth. It is very pretty at this season of the year.

— THE BOTANIC GARDEN, GLASNEVIN.—From an extract from the report for the year 1881, we learn that there was an exceptionally large number of visitors to the garden during the past twelve months as compared with previous years. There was an increase of 19,029 on 1879, and 47,157 on 1880, the total number in 1881 being 249,911, made up as follows:—Sunday visitors, 187,114; week-day visitors, 62,797. The highest monthly attendance was in July, when the gardens were visited by 35,435 persons; September coming next with a total of 33,080. This gratifying increase is chiefly attributed to the fine dry season, and also to the fact that on the principal holidays the weather was fine.

— VEGETATION OF THE KUFARA GROUP OF OASES.—The *Sitzungsberichte des Botanischen Vereins der Provinz Brandenburg*, contains a flora of this interesting and remote group of oases, drawn up by Dr. ASCHERSON from the collections and observations of G. KOHLFES. This celebrated traveller visited Kufara in 1879, and was the first European who set foot there. The lateness of the season, and the hostile attitude of his Arab escort, prevented a thorough investigation of the botany. The latter circumstance was also the cause of the untimely end of the journey. KOHLFES stayed in the Kufara group during a part of the months of August and Septem-

ber. In the Egyptian oases the water-yielding strata are very deep, often so deep that wells have to be sunk to a depth of more than 100 yards, whilst in Kufara they are either from 1 to 3 yards of the surface, and the separate oases are of much larger extent, a single one exceeding in size the county of Sussex. Nevertheless, the former Teboo inhabitants did not reach a very high step in agriculture; and the plantations formed by the new settlers, about twenty years ago, are too young too enable us to draw a comparison between the variety and luxuriance of the plants intentionally and those unintentionally introduced by man. The Kufara group, although large and presenting large areas covered with a spontaneous vegetation, appears to be exceedingly poor in species—partly owing, no doubt, to its being isolated from other fertile spots by immense tracts of plantless desert. KOHLFES noted the almost total absence of weeds; but the season of the year must be taken into account. Even the *Alhagi maniformis* was not seen. Among cultivated plants the Fig had run wild and become perfectly naturalised, bearing edible, though not very good fruit. The list of plants, wild and cultivated, numbers only thirty-nine, and is so interesting on account of the remoteness of this group of oases that we give it in full:—

- | | |
|-------------------------------|-------------------------------|
| <i>Portulaca oleracea</i> | <i>Capsicum annuum</i> |
| * <i>Tamarix</i> sp. | * <i>Salsola lutea</i> |
| <i>Abelmoschus esculentus</i> | * <i>Salsola peruvia</i> |
| <i>Gossypium</i> sp. | * <i>Portulaca monacantha</i> |
| <i>Vitis vinifera</i> | * <i>Calligonum comosum</i> |
| <i>Citrus limonium</i> | <i>Ficus carica</i> |
| * <i>Aurantium</i> | <i>Pithecia dactylifera</i> |
| * <i>Monsona nivea</i> | <i>Typha angustata</i> |
| <i>Medicago sativa</i> | <i>Alium Cepa</i> |
| * <i>Acacia arabica</i> | → <i>sativum</i> |
| → <i>Seyal</i> (?) | <i>Juncus maritimus</i> |
| <i>Amygdalus communis</i> | <i>Sorghum vulgare</i> |
| → <i>persica</i> | <i>Luperula cylindrica</i> |
| <i>Prunus Armeniaca</i> | <i>Panicularia</i> sp. |
| <i>Punica granatum</i> | <i>Euphorbia coracana</i> |
| <i>Cucumis Melo</i> | * <i>Vitis spicata</i> |
| <i>Citrullus vulgaris</i> | <i>Avicula Piracanthis</i> |
| <i>Olea europaea</i> | <i>Triticum vulgare</i> |
| <i>Solanum Lycopersicum</i> | <i>Hordeum vulgare</i> |
| → <i>melongena</i> | |

Those species preceded by an asterisk are regarded as indigenous. The total number of Date Palms was estimated to exceed a million. Many of the plants enumerated are only cultivated on a small scale in the gardens of the Senoosii settlers.

— *COLEOGYNE CRISTATA ALBA*.—The new and charming pure white form of *Coleogyne cristata* is now in flower in Mr. WILLIAM BULL'S establishment. Of new and desirable orchids this may be considered one of the most chaste and beautiful.

— *CINCHONA*.—With reference to the *Cinchona* mentioned in a recent issue (p. 791, vol. xvi.), Mr. HOLMES writes as follows to Messrs. THOS. CHRISTY & CO. who have forwarded the letter to us for publication:—"In reply to your inquiry respecting the leaves, barks, and seeds of *Cinchona* forwarded to me, I may say that I have carefully compared them with specimens in the museum of this Society, and the barks correspond well with the finest specimens of cultivated Bolivian *Cinchona* here. With respect to the leaves and fruit, so far as I can judge, the *Cinchona morada veluta* is the *Cinchona Calisaya Boliviana* subvar. pubescens of WEDDELL'S Notes (Transl., p. 44), and the *Calisaya verde* is, so far as I can ascertain, WEDDELL'S *Cinchona Calisaya oblongifolia*, and the tree concerning which MARKHAM (*Travels in India and Peru*, p. 276) gives the following account:—"I have been assured by GIRONDA and MARTINEZ that there are three sorts of *Calisaya*; the *Calisaya fina* (*C. Calisaya vera*, Wedd.), the *Calisaya morada* (*C. Boliviana*, Wedd.), and the *Calisaya verde*. They also told me that the last-named tree was a very large one, with leaves wholly devoid of any red colour on the nerves, and habitually growing very far down the valleys, and even in the plains. A tree of this variety supplies 600 or 700 lb. weight of bark, whereas the *Calisaya fina* yields only 300 or 400 lb. GIRONDA declares that in the province of Muneças, Bolivia, he saw one that furnished 1000 lb. of taba—that is to say, of the bark of the trunk and lower branches." These remarks confirm the statement made in the copy of the letter forwarded with the barks, viz., that it pays better to cultivate the *Calisaya verde* than the *Calisaya fina*; or, in other words, that, although the *Calisaya verde* yields only 64 to 9 per cent. of pure sulphate of quinine (while the very best *Ledgeriana* yields 13 per cent., and other specimens not more than 6 per cent.), yet as the *Calisaya verde* yields

twice the amount of bark than the *fina* or *Ledgeriana* does, this is equivalent to from 13 to 18 per cent. of quinine in the *Calisaya verde*; moreover, from the fact that the *Calisaya verde* is a more vigorous tree than the delicate *Ledgeriana*, and will grow at a lower elevation, it is obvious that it can be cultivated to a much greater extent, and may be extremely valuable for grafting the *Ledgeriana* upon, more especially since the attempt to graft the *Ledgeriana* upon *C. succubra* has proved unsuccessful. I am not aware that the *Calisaya verde* (*Cinchona Calisaya oblongifolia*) has as yet been introduced into India, and I think you are to be congratulated on having succeeded in obtaining seeds of so valuable a *Calisaya*." *E. M. Holmes, Pharmaceutical Society.*

— BIBLIOGRAPHY OF RUSKIN.—A new edition of the *Bibliography of Ruskin*, corrected and brought down to the present time, is in the press, and will be issued shortly by Mr. ELLIOT STOCK.

— DEATH OF SIR ROBERT CHRISTISON.—We regret to have to announce the death of Sir ROBERT CHRISTISON, a very eminent Edinburgh physician, whose multifarious labours in medicine, medical jurisprudence, and materia medica did not prevent him from interesting himself in botany and arboriculture. Of late his memoirs on the best methods of measuring trees and estimating their age have attracted much attention.

— THE DEATH OF THE REV. GERARD SMITH is also announced. His *Flora of South Kent*, published many years ago, is a delightful companion even now to the field botanist, and its numerous notes are so interesting and betoken such keen observation that it is matter for regret that he was not able to continue his botanical researches. He retained, however, his fancy for botany to the last, and it is not long since we were privileged to publish some communications from his pen.

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending January 30, issued by the Meteorological Office, London.—The weather during the first few days of this period continued dull, with a great deal of mist or fog, but no rain. By the 27th, however, it had become less settled, rain falling in the southern and south-western districts, while some heavy snowstorms were experienced in the north of England. The temperature has been a little above the mean, except in the north-western, central, and southern parts of England, where it was about equal to the mean value. The maxima varied from 54° in "Scotland, E.," "England, S.W.," and "Ireland, S.," to 51° in the east of England and north of Ireland. The minima, which were registered during the earlier part of the period, ranged from 26° over the greater part of England to 29° in "Scotland, E.," and 31° in "Ireland, S." and "England, N.W." The rainfall has been rather more than the mean over central and north-western England, and equal to the mean in "England, N.E.," but in all other districts the fall was less than the average. Bright sunshine was still very deficient, the percentages ranging from 29 in "Scotland, E.," and about 20 in Ireland to 2 in "England, S." Depressions observed.—During the greater part of this period the barometer continued highest in the south-east part of our area, while some depressions were shown to the north-westward and westward of our islands. The wind was light from between E. and S.E. in the south, generally moderate or fresh from the southward in the west, and from the south-west in the north. By the 28th, however, the distribution had changed: pressure had increased briskly in the north, and a depression had appeared between Scilly and Valencia. This disturbance travelled eastward, and caused an easterly current to spring up, though moderate generally, increased to a fresh gale on the east coast of England and over the Irish Sea at the close of the period.

— GARDENING APPOINTMENTS.—MR. R. ALLEN, late Foreman at Holme Lacy, Hereford, has been engaged (through Messrs. E. G. HENNINGSON & SONS) as Gardener to Captain SPENCE, Wynberg House, Wymberg, Cape Town, South Africa.—MR. WILLIAM HALL, who has been for some time under Mr. GLEN at Wentworth Woodhouse, Rotherham, has been engaged as Gardener to G. WHITEHEAD, Esq., Deighton Grove, York.

WINTER FLOWERS AT SWANLEY.

It was a strange experience when, going to Mr. Cannell's Home for Flowers at Swanley to see his grand collection of Chinese Primroses, the winter blooming plant *par excellence* of the greenhouse, we found something even more beautiful, and far more brilliant in a long house filled with single-flowered zonal *Pelargoniums* in such superb bloom as to literally take aback even one not accustomed to be surprised. Here was the remarkable fact shown, that the finest display of winter flowers was furnished, not by winter flowers at all, but really by plants with which we have hitherto associated summer's most brilliant floral hues. Mr. Cannell has shown boxes of zonal *Pelargonium* blooms, both single and double, so often, and in such superb form that we have grown quite accustomed to them. Still there was always the suspicion existing that these flowers thus presented in boxes were but the sparse and carefully collected product of a large number of plants, grown at great cost and with much trouble. No greater mistake could have been made, for zonal *Pelargoniums* are grown and flowered all through the winter at Swanley, with just as much care as any ordinary gardener may grow Primulas, if not with even less trouble.

The long 100-foot house, 12 feet wide, devoted to the single kinds, is full throughout with plants nearly all in 6-inch pots and all in glorious bloom, really as much so as if it were June and not January, whilst the colours of certain kinds are even purer or more brilliant. There is just within the door a big lot of that pure new white kind, *Eureka*, literally covered with bloom. Here, as a winter bloomer, it is the very best white we have—very pure, very free, and a first-rate habit, and if the market growers could be set it they would no longer pin their faith to Madame Vaucher. Then just opposite is the *White Vesuvius*, looking almost pink in the presence of its new rival. This *Vesuvius* is a splendid winter bloomer, and here is singularly pleasing, but as a white sort it cannot hold a candle to *Eureka*.

It is, of course, not possible to note many of the kinds now so brilliantly blooming in this house, but a selection of a dozen of the sorts that not only struck us as singularly effective and distinct, but which are also capital winter bloomers, is here given, the first being the *Eureka* above mentioned. A striking contrast to that is the popular summer bedder, *Henri Jacobi*, here in superb bloom, its flowers an intense crimson. A lovely kind is *Lizzie Brookes*, the flowers of fine form and of a rich rose scarlet; so also is *Lumen*, a brilliant crimson-scarlet with a white eye. Both these kinds cropped up continually as very striking. Dr. Denny's Commander-in-Chief has fine vermilion-scarlet flowers, quite a grand kind; and *Constance*, a rich rose pink, is very beautiful and free. (Quite a distinct hue is *Mrs. Strutt*, the flowers of a soft lilac. *La France* has blooms of a rich magenta hue, a considerable improvement on Dr. Denny. A very distinct and pleasing flower is *Mrs. Moore*, the ground white, and a ring of rich carmine round the eye; whilst the very best winter blooming salmon is *Fanny Catlin*. A very striking kind, indeed, is *Attala*, flowers rich orange-scarlet, and of fine form; very lovely is *Edith Pearson*, the flowers of a delicate rose-salmon, and singularly effective. *Eva*, very rich magenta, is indeed beautiful; and *Mrs. Pollett*, rose-scarlet with white eye, is a grand flower. It does not follow that a month earlier—for these plants have been full of bloom from September last—but that other dozens quite as good might have been picked out, but these were the best selection to our liking but a few days since.

Now, how does Mr. Cannell succeed so well in having these *Pelargoniums* in such superb bloom all through the winter?—for after all it is less in sort and more in culture that the means of success lie. Houses have much to do with it, for they are low, light, and well ventilated on the top. Heating has something to do with it, for just one-third of the heat is given, not below, but just over the plants and close under the roof. But preparing the plants also is an important point, and this is done by selecting spring-struck cuttings put into small pots singly, for all *Pelargoniums* are struck in this way here. The young plants are shifted into their blooming, that is, 6-inch pots, in June, and are well pinched back; are then stood in the house to promote quick rooting, and then go out into the open air for a few weeks to make plenty of short-jointed robust shoots. No bloom is permitted

to expand till August, and within a fortnight after the plants are run in they are literally a mass of bloom, and so continue all through the winter. What is here done so well, is also done in a far larger way in some of the market-plant establishments, and in a much smaller way might be done in almost every private garden.

Besides the single kinds there is a house devoted to the double Pelargoniums, and though this does not present such a brilliant appearance, yet there is an astonishing lot of bloom, the trusses are large and clean, not a tinge of damp or decay is to be seen on them, and these blooms are, because of their retentive nature, most serviceable where cut flowers are wanted. We picked out a dozen kinds that were superbly blooming, and not one but must be ranked as first-class, both now and at all seasons. General Gallifet is a curious and very taking flower, quite laced and flaked with rosy-pink upon a white ground. F. V. Raspail is a brilliant scarlet; Charles Darwin, purplish-red, shaded with violet—a perfect flower; Jules Simon, cerise-pink, very free; M. Gelein Louvagine, fine cerise-scarlet; Aglaia, magenta, very free and striking; Grand Chancellor; General Faidherbe, very deep crimson, shaded violet; Heroine, pure white, and very fine pip—a beautiful kind; Madame Delloy, lovely pale flesh colour, very beautiful; Sergeant Hoff, rich orange-scarlet; Sylvia, bright lilac-pink; and Ithenri Cannell, rich violet, shaded—a superb kind. It is well to mention that doubles need from four to five degrees more heat than the singles do.

CHINESE PRIMROSES.—It must not, however, be concluded that although the Pelargoniums so far out-distance the Chinese Primroses these latter are disappointing. So far from that being the case they are truly beautiful, and form a wonderful collection; but just at the present moment it will surprise many who have seen the grand plants shown by Mr. Cannell during the winter to learn that not a plant is in full bloom, although there are thousands, in fact three 100-foot houses quite full of them. Mr. Cannell grows plants ostensibly for show, really to produce seed, and therefore every one had had its head of bloom taken off and had been repotted into 6-inch pots, in which they are to make fresh flower, and then seed so that in a month or so the display will be a grand one. The rich madder-coloured Swanley Red is in splendid form, its very deepest hue being found in Dr. Denny, a superb selection. There are many hundreds of the Swanley Red, and with the promise of such a big stock it ought to become a popular market kind. The Swanley Purple, really a deep violet shaded flower, is a beautiful companion kind, and one of the richest hues of this shade we have; the form is of the finest, and the flowers large. There is, too, a Swanley Carmine; the flowers large, and of a pleasing warm carmine tint. And there is also a Swanley White; flowers large, pure paper-white, and most freely produced. The plants differ from others in having leaf-stalks of an intermediate colour—half green, half red—and the kind is distinct from all other whites. There is a wonderful white kind produced on plants that have peculiar robust massive leafage; the flowers are enormous, and is a grand match for Tomkins' Queen, but this latter has Fern-leaf foliage, the flowers white, tinted with pink, of great size but too much crumpled. A charming kind is Delicata, which has pale green Fern-leaf foliage, and fine blooms of a rosy-lilac kind, edged with white. Princess of Wales, certificated the other day, is a lovely salmon-tinted flower, and very free. There are other shades of lilac, of purple, and of carmine, indeed the collection is a most varied one. Very striking indeed are several of the white speckled or punctata kinds, the flowers of medium size, perfect form, finely fringed, and freely produced. The magenta, crimson-red, and carmine are beautiful, and only need enlarging to the size of our best kinds to be almost perfect. A few blues, of the Hobson Gem type, are in the collection, and will be useful as cross breeders.

Of other winter flowers Cyclamens are a good feature, and next winter the Swanley collection will be a splendid one. The new white Heliotrope, White Lady, is in abundant bloom, and should make a popular market plant; so also should the new blue kind, President Garfield, the flowers of which are the brightest colour yet seen. A batch of the old Cineraria cuncta in full bloom ought to delight the most enthusiastic admirer of anti-florists' single flowers, but far prettier is what Mr. Cannell not inaptly calls the Blue Paris Daisy, the *Agathæ celestis*, a charming

thing for winter blooming. There is a fine lot of double Cinerarias coming into bloom, and a huge lot of fine plants of single kinds, among which Mr. Cannell's *March Past* shows up prominently. The double Tropæolum, *Hermine* Grashoff, shows itself to be a good winter-blooming plant. There are many fine kinds of double Primulas, but these show no novelties. They are well done, as all things here are, and no higher praise need be given.

HOME CORRESPONDENCE.

Hardy Flowers at Heatherbank.—In Mr. Wilson's garden at Heatherbank, Weybridge, there is now a good show of Primroses, purple, yellow, and white Snowdrops, and several varieties of hardy Cyclamens, which are exceedingly healthy and well grown. The leaves of *C. europæum* are of wonderful size, and very richly marked. It is evident from Mr. Wilson's success with these plants that shelter is an important item in his system of cultivation. The plants that have the largest development of leaves and flowers are invariably those that enjoy the most sheltered situations, the base of a rockery, and peeping out of pockets or little nooks between stones, where they are snug and cozy let the wind blow high or low. As an instance of the favourable nature of the situation combined with the effects of the mild weather, it may be mentioned that the lovely blue *Lithospermum prostratum* is now in full flower months before its proper season. The plant is, however, in a position where it has in all probability suffered a little from drought last autumn, and was consequently forced into premature flowering. The fact of its being in flower in January still remains a remarkable instance of what may be accomplished in a mild season in gardens exceptionally favoured as regards shelter and climate. *W. H.*

Pear Trees in Flower.—I send you a small box of flowers which I gathered to-day from a Pear tree in Messrs. W. Pritchard & Son's nursery, Shrewsbury, about 100 yards from the Severn. The variety is Brockworth Park, not a very early one, but it is a mass of flowers at the present time, and many other sorts are bursting into blossom. The show for Pears is a grand one at present, but what will it be like if frost comes? *J. Don.*

Ice Storing in Sawdust.—If Mr. Melville will refer to the *Gardeners' Chronicle* for January 8, 1876, p. 43, he will see that sawdust was used here then, as now, as a means of preserving ice in stacks above-ground, and by way of supplementing the remarks which I then made respecting the *modus operandi* of stacking ice in the "open air" at Longford Castle, I beg to inform Mr. Melville and those of your readers who may be desirous of having a supply of ice all the year round that it is not at all necessary to expend £20 or £25 in the excavation of pits, &c. In order to make myself better understood I may at once state that when we had filled our icehouse, which in every particular corresponds with the description given at p. 45 of the one at Dunrobin, we used to make two large stacks of ice in the open (above-ground), and which answered admirably; however, having further considered the matter, we arrived at the conclusion that 300 loads of ice made into one large heap would keep better, and that we should incur less labour expenses than with the same quantity made into two stacks. Therefore, the last week in November, 1880, we made one large stack instead of two smaller ones, as follows:—"In a valley over-hung with spreading trees (but not immediately over the stack), the luxuriant foliage of which renders a shady and agreeable canopy to the stack during the summer and early autumn months, and at the bottom of the slope (a north-east one, and which is rather steep, thus affording ample drainage) we commenced our stack, and built "uphill" about 15 feet to the edge of the cartway, which had been made for the occasion. There were some hurdles placed at the bottom, forming a kind of semicircle, to prevent the ice when "tipped up" at the top from going beyond its bounds. The ice, the same as in the house, was well broken and rammed together, and boiling water applied as the work proceeded to consolidate it. When the stack was headed a man with a ladder placed against it, spade in hand, commenced at the top, and trimmed the whole stack right round to the top, thus filling all the crevices with the descending "ice dust," which was well beaten in as the operator progressed with his work. This done, the whole was covered with sifted sawdust 4 or 5 inches thick (a half-inch mesh sieve was used for the purpose), then 2 feet thick of freshly collected leaves, over which some long litter was placed to prevent the wind from blowing the leaves off, and, as a "finishing touch," the stack was enclosed by hurdles, which were fastened by tar-storing to stout sticks driven into the ground, by which means the cattle, &c., are kept away. In

conclusion, I may state that we have not yet (January 20—nearly fourteen months from the date of making it) finished this stack—a circumstance which fully demonstrates the fact that a supply of ice can be had all the year round without incurring the expense of making and filling an ice-house, inasmuch as half the labour necessary to fill the latter would suffice for making the stack. And, in order that the opening made in the coverings of the ice-stack each time that a fresh supply of ice is required may be again rendered air-tight, it will be advisable to send the same men on each occasion. *H. H. Ward.*

Cytisus purpureus.—This happens to be one of those good old-fashioned things which is more frequently seen in a botanical garden or a high-class nursery than on a gentleman's place; why this should be so I know not, but certain it is that it is a very pretty and interesting species of the genus to which it belongs, and for this reason it is highly deserving of being brought before the notice of your readers. For the information of those who are unacquainted with it, its character may be briefly described thus—Hardy deciduous shrub, 1½ to 2 feet high, flowers freely in July, colour purple. Wherever there is a choice and varied collection of deciduous shrubs the above ought most certainly to be grown. It does not appear to be at all particular either as to soil or climate, in fact, with us it has passed through the late severe winters unscathed. *J. Horsfield.*

Broadlands.—Respecting the large trees in the grounds at Broadlands, I find by referring to my notes of them that I omitted mentioning the largest and finest tree, not only in the grounds, but on the place—an Elm—which at 4 feet from the ground is 24 feet 6 inches in circumference, about 130 feet high, and at 6 to 10 feet from the ground has two leaders, each of 6 to 8 inches in diameter. The tree, which is forming a good-sized tree, and is growing a short distance north of the mansion, is in fine condition—apparently as vigorous as ever it was. *Tourist.*

Forcing Plants in the Dark.—That many plants force better and come quicker in the dark than in houses under glass I have proved again and again, and we now always make a practice of starting all those of a deciduous nature and most herbaceous kinds in a spare part of the Mushroom-house, which being kept at a uniform temperature of between 55° and 60° just suits them, as in this degree of heat with the amount of moisture always maintained they respond at once, and start into growth with great freedom. We have this day been taking out Spiræas, Weigelas, Lulæ, Deutzias, Frunns, and such-like things that have only been in a fortnight, and yet they have pushed so much as to be now showing their bloom. It may be remembered perhaps that some years ago I advocated the forwarding or fast starting of plants in celled sheds by standing them in or plunging them in beds of gently fermenting leaves or straw, and I am now of opinion that much may be done in that way, and that the system is well worthy of the attention of all who have space in those useful structures to spare. I have now a large batch of grafted Roses standing in one of the bins of the Mushroom-house, where they are buried in leaf-soil, and I do not expect to lose one, as under such regular conditions of heat and moisture they callus and unite in a very short time. Besides those grafted I have also hundreds of Rose eyes prepared exactly in the same way as those of Vines usually are, and I hope in a few days or a week to send the Editor a batch of them to let him see and report how well they are doing. The eyes referred to are simply buried thickly, layer upon layer in pans, and covered with moist sand, to prevent the drying of which 6 inches or so of leaf-soil is thrown over the whole. If Roses can be struck in this quick and easy manner during the winter there is no reason why we should not have the greater portion of the dwarfs on their own roots, and as one eye and a piece of wood about an inch long is sufficient to start a new one, as there is no risk in a cutting. If any one should feel disposed to try their hands at this method of propagating Roses I would advise them to select the firm well-matured shoots to take the buds from, as having less pith the granulatory matter is the more readily formed. *J. Sheppard.*

Forcing Bulbs.—Lilies of the Valley, Spiræas, Hyacinths, and Tulips all now claim a most important part of the attention of growers, who may be for commercial purposes or for the embellishment of private establishments; therefore the most efficacious means of producing these as quickly as possible is of no small importance. First and foremost stands the Roman Hyacinth, and the sooner these can be got into bloom the more they are appreciated, and to accomplish this I have found that to grow them in total darkness is the most expeditious means, the most convenient place for this purpose being a Mushroom-house, plunging the pots in a bed of warm manure, at the same time placing an inverted flower-

pot over each, which can remain until the bloom-spikes require more room, by which time they are ready to be gradually exposed to light. I have found that Roman Hyacinths grown in this way are far superior, and quite as lasting as those forced in the ordinary way. The same mode of procedure is equally applicable to Lilies of the Valley, Spiræas, Hyacinths, Tulips, &c., that are required very early; others for succession can, of course, be treated in exactly the same way, but without the use of bottom-heat. *Z. Morgan, The Butts, Harrow-on-the-Hill.*

Early Strawberries for Market.—As the Vicomtesse Héricart de Thury Strawberry does not answer a "Market Gardener's" purpose, I would advise him to try Dr. Roden's Early Profide, and providing he gets it true I think he will be satisfied with it; it is a free bearer, of good size, colour, and flavour. I am using it for my first crop, and have a nice lot of fruit now swelling. My next lot will be Vicomtesse Héricart de Thury, after that President, with Sir J. Paxton to finish. I think Sir Joseph the best market Strawberry grown, being large in fruit, of a good dark colour, and stands carriage well. *S. Taylor, Acaia, Appleby, Leeds.*

—Has your correspondent, "Market Gardener," tried La Grosse Sucrée? If not, I would advise him to do so. The fruit is much larger than Vicomtesse Héricart de Thury, equally early, its appearance above mediocrity; the flavour is slightly acid, but general appearance will outweigh that slight drawback in the market. I may add that this and Vicomtesse Héricart de Thury are the only sorts we have had to any extent for forcing, as well as out-of-doors, but we shall try half a dozen other varieties this season. A few years ago Princess Alice Maude was the leading early variety grown by the Kentish growers. The Vicomtesse was known in private gardens, but I never saw or heard of the "growers" having it. Princess Alice Maude grew very large in Kent, but that is no criterion for a Darlington market gardener. *W. P. R., Preston, Lancashire.*

How to Make Seeds Germinate.—Mr. Harpur-Crewe asks how to make Choripora and other seeds germinate. In the first place he should never be in a hurry for their germination; many seeds will take a twelvemonth and more to germinate. I am pretty successful in vegetating seed, and I do it as follows: I have a small section of the house glazed all round, an evaporating pan at the bottom, and a wire trellis over it. On this trellis I place my seed-pan filled with sand, as it shows the seed off better; this sand is slightly moistened, and on the sand I place my seed, and never water them. The air is so saturated that the seed get quite enough moisture from the condensation at night: of course a nice heat must be kept up. I every morning give a rapid ventilation to change the air, and close up again. This is the best plan I have tried for germinating all seed, with the advantage of seeing how they get on, and taking up those required at any stage. *Chas. D. G. de Vascet Monteiro, Almada, Portugal.*

Balchin's New Double White Mignonette.—This novelty, which was shown by Mr. Balchin last season, is shortly to be distributed. The other day I saw some splendid branched spikes, which had been cut from plants grown at his nurseries at Hassock's Gate. What can be more valuable at this season of the year than a white double-flowered Mignonette? It is a very distinct kind, and highly attractive, with a delightful perfume, and either for cutting purposes or for decorative work will be found a gem. *A. O.*

The Cones of Sciadopitys verticillata.—Your fig. 18 (p. 112) gives an idea of the most common form of the cones of Sciadopitys verticillata in the neighbourhood of Yokohama; in fact it is the only one I saw there, and I took it for the normal state. Those I met were probably better developed than your model, and on the top of the cone the tuft of leaves came out more boldly. I was told by the nurserymen there, that at the time of maturity the terminal bud started into a leader, and the axis of the cone swelled and burst asunder the scales of the bud. But I took it for granted, and never tried to ascertain how far this statement is true. *Jeon van Volken.*

Veronica pectinata.—Enquiries are often made for plants suitable for covering the surface of the soil through which tall-growing bulbs, or such as flower without leaves, like the Colchicums, may send up their stalks—Veronica pectinata seems well suited for this purpose. It is procumbent and evergreen, and its shoots, covered with neat and elegantly crimped leaves, form a loose network over the surface of the soil without taking much out of it. The species bears blue flowers in abundance in May, and there is a variety with pale red flowers, and there may be one with white flowers, of which I should be glad to

hear, as I have never seen it. The plant grows well in any soil. *C. Wolley Dod, Edge Hall, Malpas, Jan. 30.*

Strawberry Vicomtesse Héricart de Thury.—This deserves all that Mr. Ward has said in its favour. Its merits are indeed pretty well known and appreciated now, and I believe it can be had in fruit in every month in the year. We had it at odd times till the middle of November, when our stock became exhausted, and in the last week in that month I saw in Mrs. Heywood's gardens at Norris Green, near Liverpool, pots with twelve to eighteen even half-swelled fruit, so that a very little excitement would bring them to maturity, for up to that time, judging from the other occupants of the same house, they had been kept thoroughly cool. I think I may fairly assume that they would be all ripe by Christmas, and now we have Mr. Ward ready with them on the eve of January, so the three worst months are spanned, and to have them for twelve months daily is simply a question of resources. *W. P. R.*

Leucium æstivum.—Mr. Lynch sends from Cambridge a sketch (fig. 27) of a bulb of this plant with a second growing from it. We have frequently seen a similar condition in Tulips, where it is due to the formation of a new bulb at the apex of the stem,

FIG. 27.—BULB UPON BULB IN LEUCIUM.

instead of a flower or group of flowers. What the conditions are which cause the inflorescence to be replaced by a bulb we do not know. A phenomenon of a like character occurs in the Tree or Potato Onion, where the flowers are replaced by a tuft of little bulbs.

Passiflora cerulea.—This is just now finely in fruit on the front of a mansion opposite Mr. Miles' conservatories, in the Great Western Road, Brighton. It is trained up the front of the mansion, covers a space of 15 feet by 25 feet, and is literally covered with bright orange-coloured egg-shaped fruits. It is evidently a good plant for favourable positions in seaside districts. The Eranthises also are used very extensively for decorative purposes; some trained by the sides of the windows in many of the mansions are exceedingly neat for that purpose. *A. O.*

COLONIAL NOTES.

CAPE BULBS.—Mr. Uppjohn, of Rondebosch, Cape of Good Hope, whose collections of Cape bulbs have been much appreciated for many years, retires from business in favour of Messrs. Johnson & Harman, who are also endeavouring to import a variety of trees suitable for cultivation in the colony, though hampered by the perversely stupid regulations as to the phylloxera. *C. E.*

Florists' Flowers.

THE FLOREST'S TULIP.—I have read with much interest the remarks of Mr. J. Douglas on this subject at p. 23, and I agree with him, that there is not so much fancy for the fine late Tulips as there was in former times, and this is the case on the Continent as well as in England. On the contrary, the taste and demand for early and medium single and double Tulips, with their striking colours, has much increased, especially for spring bedding. As for the late Tulips, however (the Tulipa serotina of Parkinson), there are still some collections found which may be said to be complete as far as the variation of colours is concerned. For example, my firm has kept the old collection intact which fifty years ago was annually shown in parade beds under a tent, and which collection has since been increased by introducing into it several first-rate Continental collections. So I cannot agree that in the time of Parkinson there was more variation in the colours of these Tulips than there is now-a-days. Parkinson himself in introducing this matter to the reader says:—"The late-flowering Tulip hath had his description expressed in the precedent discourse, so that I shall not need to make a repetition of what hath already been set down. [This relates to what was said about Tulipa præcox and Tulipa media.] The greatest matter of knowledge in this kind is this: that it hath no such plentiful variety of colours or mixtures in his flowers as are in the two former sorts, but is confined within these limits here expressed as far as hath come to our knowledge."

The position is quite the same at the present time: the early and medium section are more varied than the late ones, but in these, with their breeders and more or less broken varieties—viz., roses, byblossoms, or violettes, bizarres, &c.—we have certainly now a much greater variety of colours than in Parkinson's time. In this question the following peculiarity must also be taken into consideration. At present the few growers there are only care for breeders and totally broken varieties, the intermediate forms are not usually found in commerce. It is more than probable that in Parkinson's time the different degrees of variation in the same Tulip were more particularly described, and the not totally broken breeders more sought for than in the Tulip fancy time of the beginning of this century. The descriptions in the old books seem to indicate this, and in my collection of drawings of that time it is proved by several examples. *J. H. Krelage, Haarlem.*

LATE-FLOWERING CHRYSANTHEMUMS.—I beg to endorse all that has been said in favour of the variety called Princess Teek, and also to recommend another called Miss Marechaux, a pure white incurved flower, with very thick waxy-looking petals, which for quality of flower surpasses any other variety I grow. That you may form an opinion of its merits I send you a bloom. [Very fine indeed. Ed.] *Robt. Featherstone, St. Ann's Nursery, Ebury, Leeds.*

—I have great pleasure in adding to the list a valuable Japanese variety named Meg Merrilys, which did good service here in January. It is a beautiful sulphur-yellow, a colour that is invaluable either for conservatory or cut flowers for vases, &c. I have enclosed a few blooms for your inspection, which are fine and large, but sufficient to give you some notion of the value of this as a late-flowering variety. I think there are many who will agree with me, that medium sized blooms are the most serviceable where cut flowers are in request. I may add that the cuttings were not struck till the end of May, and after they were potted off they were put in the cool frame and kept close for a few days, and then removed outside with other varieties that were struck earlier and grown on in the usual way. In the autumn they were removed to the vinery until Christmas, then put into a little heat. *D. Elkins, Shrewsbury House, Cirencester.*

—I send you a few Japanese Chrysanthemum blooms, to show how late some varieties may be had in flower. The sorts now in bloom here are the Khedive, Lania, Splendens, Ethel, and Fair Maid of Guernsey. The plants are in 8-inch pots, and bear from twenty to forty blooms on each. The latter are small, it is true, but none the less acceptable at this

season on that account. *Wm. Whittaker, The Gardens, Manor House, Stockland, Bridgewater, Jan.*

CHRYSANTHEMUM LATE DUCHESSE.—This is a very late flowering kind, sent out some time ago by Mr. B. S. Williams, of Holloway. Some plants are now (end of January) in flower at Goodwood; Mr. Rutland grows it very extensively, as he finds it invaluable at this time of the year. The flowers are a pure white, pale lemon centre, medium size, and it is a very abundant bloomer; it is an intermediate form, between the Anemone-flowered and pompon sections. Where cut flowers are required this will prove itself very useful just now. *A. O.*

JAPANESE CHRYSANTHEMUM GRANDIFLORUM.—Mr. Manderson, gr. to Sir Edward Colebrooke, Ottershaw Park, Chertsey, grows under the name of Grandiflorum a bright canary-yellow coloured Japanese variety which is valuable as a late bloomer. Treated in all respects the same as the earlier sorts, this one carries on the display well into February, and on that account deserves a word of praise and recommendation.

FORESTRY.

ORNAMENTAL HEDGES AND FENCES FOR WINTER EFFECT.—When we combine what has been written with what is daily seen it would not be expecting too much to look for a great amount of improvement in the culture and management of ornamental hedges and fences for winter effect. The subject is too varied and extensive to be dealt with in one, or even several, brief chapters such as this, but as it is intended to treat only of one or two samples in the meantime, it is at least hoped that some small modicum of good may be accomplished.

There is scarcely anything connected with ornamental planting so easily attained as that of growing Ivy upon walls, stone dykes, trellises, and any other sustaining structure, and yet the cases where this is properly done are few in number compared with what they might easily be.

The Ivy most commendable is the common *Hedera Helix*; and although there are many other beautiful varieties of it, except for merely variety's sake there appears no advantage gained by planting other than the common sort, which of all others is the best and most commendable.

Having planted and covered miles of walls and dykes with Ivy, I will describe briefly why and how it is done, and what the results are.

The walls referred to are chiefly those enclosing policies and pleasure-grounds; and as such in the winter-time, when the trees and all deciduous plants are divested of their leaves, appear bare and poor to look upon, at least when contrasted with those covered with a rich mantle of green. The use of Ivy on walls is also to preserve the stones from falling out, especially walls built without mortar or cement. The rootlets find their way from side to side of an open rubble dyke, and lace the two sides of the wall together in a remarkable and useful manner. Another important use of Ivy is to grow it upon walls of houses either disposed to damp, or such as from the description of the stone, or exposure to the blast, admit of rain driving through them.

Any such walls, if covered with Ivy, are rendered perfectly waterproof, both against rain and also damp from the ground, which it assists in drying.

The manner of doing the planting is by first digging or trenching the ground 2 feet wide and 18 inches deep, or thereabouts, and if the soil is very poor enriching it a little by adding well-rotted manure or leaf-compost. If rooted plants can be got so much the better, as thereby one, or perhaps two years' growth is gained; but if rooted plants cannot be procured, the next best thing to do is to plant cuttings, the younger the better, by laying them in a notch about 3 inches deep; and in doing so the leaves, or at least part of them, must be kept above-ground. If the soil is at all inert, and deficient in sand, a small sprinkling should be put in the trench and over the plant, which greatly aids in promoting root-growth.

If from any cause, such as the wind detaching the fibrils from the wall, the Ivy remains bushy, and does not climb the wall, in such cases the lower leaves should be clipped off, and the shoot nailed to the wall, after which it rarely gives further trouble or inconvenience.

It requires pruning annually to take off the old, damaged, or withered leaves, which is best done about May, after the spring frosts and cold weather are over. Ridgeway's hedge-chipper is the best implement for the purpose of Ivy pruning, being quicker and better than any other I have seen. Walls frequently require to be planted on both sides; and when this is done the Ivy meets at the top, and the branches interlace with each other and constitute a completely covered wall, which surpasses any other hedge for winter in strength and appearance, and unless more than usually exposed to animals, answers all the purposes of an ordinary hedge-fence, and is cheaper, more substantial and durable than any, even the very best of Holly or other evergreen hedges.

Another and very beautiful winter hedge, well-adapted for several places, is that of the Cotoneaster, of which there are several varieties all suitable and well-adapted for winter screen and ornamental purposes, which can be differently constructed as circumstances require. Walls may be covered with it in a way similar to that recommended for Ivy, or a wooden paling or trellis of wire may be erected, and the plants trained up to interlace it to any desired height, and by annually trimming it a very beautiful, substantial, sheltering, permanent fence is formed.

I believe that an excellent winter ornamental hedge might be formed of the *Cupressus Lambertiana* (especially for sea exposures), rendered strong and secure against snow, wind, &c., by extending a few horizontal wires along it, so that the plants may grow up between them, and yet not interfere with their growth.

The Norway Spruce has also been tried as a hedge plant for purposes similar to the before-mentioned; but except in its young state it does not maintain its foliage and glossy hue well; and, moreover, is at best, for such a purpose, only of second-rate importance.

The Silver Fir is in several important respects similar to the Norway Spruce, but vastly superior to it for hedge purposes. Its defects, however, are that it grows less bushy, and stands pruned worse than Norway Spruce does. It is very hardy (except in situations exposed to spring frost), stands any amount of exposure, and survives to considerable age. In growing it as a hedge its top growth should not be interfered with till it has attained its full desired height, after which it should be topped, and allowed to branch and thicken, which it does beautifully.

The preceding hedges, as already said, are recommended only for their ornamental shelter and winter beauty, which are in many places most desirable things, and neither difficult to produce nor expensive to maintain. *C. Y. Michie, Cullen House, Cullen, January 9.*

The Rosery.

ROSE PROSPECTS.—It may perhaps be considered somewhat early to determine anything with regard to Rose prospects, and the utter hopelessness of being able to predicate anything of the character of the season that is before us only makes it more difficult.

The severe winters of 1879-80 and 1880-81 created tremendous devastation amongst Roses both at home and abroad. Standards everywhere perished by the thousand; and, great as were our losses, they were nothing to be compared to those in France. Around the Rose district of Brie Comte Robert, where the greatest stock of French Roses is grown, it is not too much to say that they perished by the million. So complete was the destruction that the Rose Society there, the most flourishing one in France, has for two years utterly collapsed, as there were no Roses to show. This destruction mainly arose from the fact that hardly anything but standards are grown there; it must have been very grievous, as some of the finest quarters of standard Roses I ever saw were those I saw in the early autumn of 1879, and with pardonable pride the Rose growers pointed to these as specimens of what their culture had effected; all these were swept away. The lesson, one would have thought, to be learned by such losses was, not to grow standards again; but as was the case in 1861, when nearly similar desolation took place, people consoled themselves that it would be many years before such a calamity would overtake them,

and went into it as largely as ever. It has been, indeed, nearly twenty years since then, but it is surely hardly worth while to run such risks for such a questionable form of beauty as a standard Rose. Many who grew dwarf Roses with us were caught napping, and from want of protection numbers perished; last autumn found amateurs especially (for nurserymen with their large stocks cannot do it) making their Roses snug for the winter; protection was nearly everywhere the rule, and the consequence is that in such cases the exceptionally mild winter we have had has been against them. Roses have begun to grow, buds are starting even low down, and many are expressing great doubts as to the future of their condition. It is certainly very remarkable to see the flowers of Roses now; all the upper buds everywhere have started, and I have beds of Tea Roses which have not shed a leaf as yet (Jan. 20) while the wood is firm and plump. In my own case I determined to have all ready for protection, but did not apply it, nor even much until very late, and, indeed, went through my beds and put a fork under each plant, gently lifting it, and so checking undue growth. I was sure it would do good, because Roses get in course of time too much buried, and this would also stimulate them to make fresh roots and thus take away from their power of making growth above. If danger is to be apprehended I fancy it will be mostly with dormant buds which may start early, and if cut off then are useless for the maiden blooms.

This being the present condition of Roses, what course are we to adopt with regard to pruning? Some years since, when Roses were very forward, the advice was given to delay pruning as late as possible, for it was said if you prune early, when the sap is rising, as you will most probably after a mild time have severe weather, the young growth then encouraged would be cut off. The idea was feasible, but the result did not justify the course adopted; it was found that a good deal of the vigour of the plant had been expended on this early growth, and the effect was a weakly growth in the plants and an indifferent bloom. I think, therefore, that it would be a mistake to defer the pruning this season beyond the usual time of performing that operation, say March. We are, it is true, having extraordinary weather, the barometer higher than it has been known for forty years, but still the temperature is low and sunshine deficient, and where Roses have not been coddled I do not think their state is so forward as to justify any alarm on this account. I have carefully looked over my own collection and do not see that the lower buds have moved, and I imagine that a good many other collections are in the same condition.

But then comes the question as to the manner of pruning. I am now writing only of dwarf Roses. Here, again, the two last winters have taught us something. The general plan of pruning was to leave sufficient length of wood to make nice symmetrical bushes, to cut out the centre, so as to give freedom of circulation to the air, and not to be particular as to the length of the shoots, but frost necessitated a different treatment last season. It was seen as pruning went on that the pith was affected, and it became needless to cut down lower and lower, until at last in most cases there was hardly left more than an inch or two of the shoot, which had either been covered by snow, or the protecting material used. It seemed as if all hope of a good bloom from such plants was delusive, but it was not so; they started up from the ground and underneath it to the very point of union, and splendid growth was the result. This has led many growers to the conclusion that hard pruning is the best. It is just possible for those who have exhibiting in view that it may be considered too risky, and that flowering would be too late for the shows, but in such cases, as Roses are grown by the hundred or thousand, it would be easy to adopt both plans. Prune some in the usual way and some back. In saying this one must recollect that there are some Roses which must always be pruned hard; delicate kinds, such as *Marquise de Mortemart*, ought always to be treated thus, but it is now questionable whether it is not the best method to adopt with all. There is one excellent Rose grower, Mr. Geo. Baker, of Reigate, who thus treats his Roses. His soil is not really a good Rose soil, but I do not think I have anywhere seen a more healthy or beautiful collection of plants than those that he grows; and I am therefore inclined myself to the system of hard pruning. I think there has been a great mistake with regard to Tea Roses—the invariable teaching has

been, shorten the tips but do not prune hard; but surely the last winter was a revelation to many on this point also. Tea Roses were of course very much cut by the frost, and in many cases were considered hardly worth preserving, they were, however, treated as others, and many of them—by far the largest portion—pushed up vigorously from the underground portion of the stem where on their own roots, or from the very lowest portion of the budded shoot. In fact a good many notions about Tea Roses are on their trial, their supposed tenderness being one of them. I have found some of them quite as hardy as many of the hybrid perpetuals, and even from the far North, and from the Highlands, the same account reaches me. I would therefore make no difference between Tea Roses and hybrid perpetuals in the matter of pruning: they will bear the knife well. This does not apply to Noisettes, such as *Maréchal Niel*, *Gloire de Dijon*, *Madam Derard*, and others which require very little shortening of the wood.

As the area of Rose growing is rapidly increasing we shall have the experience of many more growers on these subjects, but at present my own opinion and experience are strongly in favour of hard pruning. *W. Hand.*

MARÉCHAL NIEL ROSE ON ITS OWN ROOTS.—Those who plant this favourite Rose should not lose heart if it does not grow away vigorously at first, especially if it is on its own roots. A plant has recently come under my notice which was planted on the back wall of ainery twelve months last November, and made very little progress until the following May. It then started to grow freely, no doubt after its roots had laid hold of the rich fresh compost in which it was planted, and in a few months it had made fine shoots, two of which measured between 30 feet and 40 feet in length. Lots of Roses, indeed hundreds, are either smothered with other plants in the early stages of growth, or have their roots destroyed with drip from other plants, and yet people wonder why plants do not grow after they have (unconsciously no doubt) done everything possible to prevent them. *W. Hand.*

ROSES.—We generally prune the hybrid perpetuals very late in the spring, but we are rather puzzled how or when to prune this year, as the buds have started on the whole length of the young wood in many instances. There is no alternative but to leave them alone for some time longer. It may be that there yet may be sharp frosts, and in that case the Roses would suffer more injury pruned than they would if unpruned. Those who tied up the heads of the standards with some protecting material to preserve them from frost will be in still worse plight, as the growths will be blanch under it. Where a thick coating of littery manure has been placed round the base of dwarf plants it ought to be drawn a little away from them, but should be in readiness to be replaced in case the frost should yet be severe enough to injure them. Planting should now be finished with the least delay possible, and do not fail to mulch round the roots of the plants as soon as they are put out. Cuttings of Tea Roses that were put in last autumn have done remarkably well; they are yet in the cutting-pots in cold frames, but they will be potted off singly as soon as we have an opportunity to do so. A little peat of a light character should be added to the potting material. *F. Douglas.*

LATE FLOWERING ROSES.—I have noticed the following varieties for several years as being among the best to flower late in the season, often in mild winters, and in a sheltered position, continuing up to and after Christmas—(Queen of the Bourbons (one of the best), *Tea*, *Safrano*, *Noisette*, *Triomphe de Rennes*, *China*, *Cramoisie Supérieure*, and *Just*, but by no means least, the common pink *China*, or monthly *Rose*. The varieties with loose open flowers, such as the exhibitor treats with contempt, expand by far the best in the dull and damp days of winter. Such kinds as *Gloire de Dijon* often bear plenty of late buds, but they fail to open in bad weather, and eventually turn brown and fall off, but a few hours' sun will cause the loose-flowering ones to expand to perfection. It is worthy of note that scarcely any of the famous exhibition varieties show themselves at this part of the year. I once saw a beautiful handful of Tea Roses cut from a warm position in the open air on January 3. They consisted of *Safrano*, *Madame de St. Joseph*, *Madame Falcot*, *Triomphe de Guillot*, and *Homere*. This

was in Kent, in 1877. Should a sudden change occur in the weather, it is a good plan to cut all that are on the point of expanding, and place them in a temperature of 45° to 50°. If supplied with water they will continue their progress, and afford many useful flowers which would otherwise be lost. *W. H. Divers, Bursley.*

Reports of Societies.

Manchester Royal Botanical and Horticultural. *Jan. 30.*—The fifty-fourth annual meeting of the subscribers and friends of this Society was held in the Mayor's Parlour of the Town Hall, the Right Hon. the Earl of Derby (President of the Society) in the chair. The Chairman, in moving the adoption of the report, said that they would observe that it was stated that the International Exhibition held at Whitehouse was attended by nearly 50,000 persons, and that what was very rightly called the great event of the year—the International Exhibition, which was held in the month of August, had been from every point of view an entire success. His lordship, however, generally admitted that no exhibition of the kind had been held out of London of equal merit or importance. The one thing that failed them was the weather. That was very unfavourable, and as a necessary consequence the financial results were not altogether what they had hoped and expected. It was intended that the funds expected to result from that exhibition should have been applied to the replacing of various glasshouses, and in carrying out other necessary improvements in the gardens. It had not been possible to do that to the extent which was desired or contemplated, but to a certain extent it was being done. There was a surplus of £800, and that would be applied to the purposes which he had mentioned. The number of visitors who had attended the various exhibitions in the course of the year was put at nearly 2,000,000, and the sum given away in prizes in the course of the year was £2,200. The Council proposed that a rather more ambitious name should be adopted by the Society. It was formerly, and was at present, known as the Botanical and Horticultural Society of Manchester, and it was now proposed to add the words "and Northern Counties," because it was found that a great deal of the support which it received, and a great proportion of the visitors who attended the exhibitions came from districts far beyond the immediate range of Manchester. He was asked to mention the fact that assistance had been frequently given—in fact was habitually given—to the small local societies which were established in various parts of this county. The members of those small local societies were generally working men, and it had been found to be of advantage to them, and an advantage in many ways, to be invited to hold their shows in connection with the exhibitions of the Manchester Botanical Society. On the motion of Mr. S. L. Helm, seconded by Mr. B. Arncliffe, it was resolved, "That the Society be henceforth called the Royal Botanical and Horticultural Society of Manchester and the Northern Counties." The Chairman, in putting it, stating that the addition was only proposed in order to bring the name of the Society into accordance with the facts.

The officers of the Society for the ensuing year were then elected, the list including the Earl of Derby as President, and the Mayor of Manchester, Dr. Ainsworth, the Rev. Canon Gibson, and Mr. Joseph Broome as Vice-Presidents.

Variorum.

FORESTS OF NORTHERN SIBERIA.—On the slopes of the steep tundra bank and in several of the tundra valleys there is an exceedingly rich vegetation, which already, only 100 kilometres south of Yefremo-Kamen, forms actual thickets of flowering plants, while the tundra itself is overgrown with an exceedingly scanty carpet, consisting more of mosses than of grasses. Salices of little height go as far north as Fort Dickson (73° 30' N. lat.), the dwarf Birch (*Betula nana*), Elm is met with only as a bush creeping along the ground, at Cape Schaitanskoj (72° 8' N. lat.); and here, in 1875, on the ice-mixed soil of the tundra we gathered ripe Cloudberries. Very luxuriant Alders (*Alnus fruticosa*, Ledeb.) occur already at Mesenkin (71° 28' N. lat.), and the Birchov Islands (70° to 71° N. lat.) are in several places covered with rich and luxuriant thickets of bushes. But the limit of trees proper is considered to begin first at the great bend which the river makes in 69° 40' N. lat., a little north of Dudino. Here the hills are covered with a sort of wood consisting of half-withered grey moss-grown Larches (*Larix sibirica*), which seldom reach a height of more than 7 to 10 metres, and which much less deserve the name of trees than the luxuriant Alder bushes which grow 2' farther north. But some few miles south of this place, and still far north of the Arctic Circle, the Pine forest becomes tall. Here begins a veritable forest, the greatest the earth has to show, extending with little interruption from the Ural to the neighbourhood of the sea of Ochotsk, and from the 58° or 59° of latitude to far north of the Arctic Circle, that is to

say, about 1000 kilometres from north to south, and perhaps four times as much from east to west. It is a primeval forest of enormous extent, nearly untouched by the axe of the cultivator, but at many places devastated by extensive forest fires. On the high eastern bank of the Yenisei the forest begins immediately at the river bank. It consists principally of Pines: the *Centra Pine* (*Pinus Cembra*, L.) valued for its seeds, enormous Larches, the nearly awl-formed Siberian Pine (*Pinus sibirica*, Ledeb.), the Fir (*Pinus obovata*, Turcz.), and scattered trees of the common Pine (*Pinus sylvestris*, L.) Most of these, already north of the Arctic Circle, reach a colossal size, but in such a case is often here by all forestry, grey, and half dried up with age. Between the trees the ground is so covered with fallen branches and stems, only some of which are fresh, the others converted into a mass of wood-mould, held together only by the bark, that there one willingly avoids going forwards on an unbroken path. If that must be done, the progress made is small, and there is constant danger of breaking one's bones in the labyrinth of stems. Nearly everywhere the fallen stems are covered, often concealed, by an exceedingly luxuriant bed of mosses, and also on the other hand of ferns, probably in consequence of the dry inland climate, *Selagin*, occur sparingly. The Pines, therefore, want a very mossy covering common in Sweden, and the bark of the Birches which are seen here and there among the Pines is distinguished by an uncommon blinding whiteness.—From the "Ergasse of the Vega," by Baron Nordenskiöld.

METEOLOGY.—The following resolutions were adopted by the Conference for the development of Agricultural and Forest Meteorology, held at Vienna in Sept. 1880. (*Ö. Verh. Meteor. Soc.*, VII., published in No. for April):—"Vegetation is materially dependent on the following meteorological elements:—(a) temperature of the air and soil; (b) duration and intensity of the illumination; (c) all the hydrometers; consequently, the vapour tension and relative humidity, precipitation (rain, snow, &c.), as well as the other forms of condensation (fog, dew, and hoar-frost); (d) motion of the air. On the other hand the daily march of pressure and of course appears to be of less importance for vegetation. Conversely, the meteorological elements appear to exhibit the influence of vegetation in the following way. Vegetation on an augmented scale, such as pasturage, tilled land, forests and moorland, &c., give rise each in their own districts to special conditions of temperature and atmospheric humidity, and perhaps of rain also, and may therefore exert an influence on the climate of the surrounding country in respect of temperature and hydrometers, and also of springs." "On the whole it appears important that on as many rationally managed estates as possible special observations should be carried on of all the elements recognized as important. These observations should be made in different soils, and with different types of culture, and should be compared with the crop return year by year, so as to investigate in detail the relation between vegetation and meteorological elements. The general mean results published by the several institutes do not furnish values in sufficient detail for the study of individual types of culture or of local conditions. [Then follow instructions in the method to be adopted for observing the various elements, with remarks on the trustworthiness of instruments, which will be given in connection with each element.] It is advisable to organise the system of radial stations, in order to ascertain the direct extensive masses of vegetation, especially forests, exert on the climate of the surrounding region, both in their immediate vicinity and at a distance. This system promises better results the more continental is the character of the region in which it is established. Observations immediately above the tree crown are of importance. Would it not be desirable, with a view to the special observations which must be undertaken (as, e.g., phenological observations) to prepare a general form of instruction? The Conference thinks it desirable to prepare general instructions for phenological observations. The list of plants to be observed should not be too long. [Members of committees] should deal in the first place with cereals and forage plants; secondly, with the more important forest and fruit trees; and lastly, with other plants of importance to agriculture and to the phenomena of animal life."

HOUSES BUILT OF COTTON.—Of all substances apparently the least likely to be used in the construction of a fireproof building, cotton would perhaps take the first rank and paper the second, and yet both these materials are actually being employed for the purpose indicated, and their use will probably extend. Compressed paper pulp is successfully used in the manufacture of doors, wall-panellings, and for other similar purposes, with the result that all risk of warping and cracking is obviated, while increased strength is attained, and the fear of dry rot is forever banished. *The Times* has lately shown a useful purpose in an unobtrusive manner for years as a material for small trays, paper-knives, and other

such light articles, has now suddenly assumed a still more important position in the industrial world. A still more sudden and striking advance has been made in the employment of cotton as a building material. A preparation called celluloid, in which cotton is a leading ingredient, has been used lately as a substitute for ivory in the manufacture of such articles as billiard balls and paper cutters; and now a Canadian manufacturer has invented a process by which compressed cotton may be used not merely for doors and window-frames, but for the whole fabric of large buildings. The enormous and increasing demand for paper for its normal uses as a printing and writing material prevents the extended use of *papyrus-nitidus* as a building material, for which it is so well suited in so many ways; but the production of cotton is practically unlimited, and there seems to be a large field available for its use in its new capacity as a substitute for bricks—or at least plaster—and wood. Treated with certain chemicals and compressed, it can be made perfectly fire-proof and as hard as stone, absolutely air and damp proof; and a material is thus produced admirably adapted for the lining—internal or external—of buildings of which the shell may or may not be constructed of other material, while it easily lends itself to decorative purposes. *Colonist and India.*

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 25, 1882

MONTH AND DAY.	BAROMETER		TEMPERATURE OF THE AIR.			HYGROMETRIC DEVIATIONS FROM GLASHER'S FALLS (Ed. Ed.).	WIND	RAINFALL.

- Jan. 26.—A dull, orcast, frosty morning; erid, cloudy day
- 27.—A dull, damp, overcast morning; fine, bright afternoon. Fine mid night.
- 28.—A fine fresh morning, rather windy, warm day. Fine, overcast night, moon's phase visible.
- 29.—A fine day, sky overcast and dull. Dark night.
- 30.—A dull, damp, overcast day. Fine night.
- 31.—A dull, overcast, windy, cold morning. Fine night, sky overcast.
- Feb. 1.—A fine, bright day, sun shining brightly, deep blue sky. Fine, clear, cold night.

LONDON: *Atmospheric Pressure.*—During the week ending January 28, the reading of the barometer at the level of the sea decreased from 30.68 inches at the beginning of the week to 30.57 inches by midnight on the 22d, increased to 30.72 inches by 9 A.M. on the 24th, decreased to 30.74 inches by 3 P.M., and increased to 30.77 inches by midnight of the same day, decreased to 30.37 inches by 9 A.M. on the 27th, increased to 30.39 inches by midnight of the same day, and was 30.28 inches at the end of the week.

The mean reading for the week at the level of the sea was 30.54 inches, being 0.20 inch lower than last week, and 0.62 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 59° 5, on the 28th. On the 25th the temperature did not rise above 33° 5. The mean of the seven high day temperatures was 47° 1.

The lowest temperature in the week was 27° 5, on the 23d; on the 28th the lowest temperature was 43° 5. The mean of the seven lowest temperatures was 32°.

The greatest range of temperature in one day was 13° 5 on the 24th; the smallest was 4° 8 on the 29th. The mean of the seven daily ranges was 9° 1. The mean daily temperatures were on the 22d, 37° 1, on

the 23d, 33° 7, on the 24th, 35° 5, on the 25th, 31° 1, on the 26th, 32° 6, on the 27th, 41° 4, on the 28th, 47° 4, and these were below their averages till the 26th, by 0° 3, 3° 5, 2° 2, 0° 7 and 5° 3 respectively, and above the average on the 27th and 28th by 3° 3 and 0° 2 respectively. The mean temperature of the air for the week was 37°, being 0° 3 higher than last week, and 0° 8 lower than the average of the week.

The highest reading of a thermometer with blackened bulb in *vacuo*, placed in the fall rays of the sun, was 63° 5, on the 24th; the highest, on the 25th and 26th, was 38° 5. The mean of the seven readings was 47° 5.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 21° 5, on the 26th. The mean of the seven readings was 27° 8.

Rain.—No rain fell during the week.

ENGLAND: *Temperature.*—During the week ending January 28, the highest temperature, were 50° at Truro, 54° at Sunderland, and 53° 2 at Bristol. The lowest temperature, at Wolverhampton was 46° 8, at Hull 48°, and at Brighton and Nottingham 48° 8. The general mean was 50° 9.

The lowest temperatures in the week were 25° at Truro, 27° 4 at Cambridge, and 27° 3 at Blackheath. The lowest temperature at Bradford was 34° 6, at Leeds 34°, and at Liverpool 33° 2. The general mean was 29° 9.

The greatest ranges of temperature in the week were 31° at Truro, 25° 4 at Cambridge, and 25° at Bristol. The least ranges were 13° 7 at Bradford, 12° at Leeds, and 18° at Hull. The general mean was 21°.

The mean of the seven high day temperatures was highest at Sunderland, 49° 7, at Truro 48° 3, and at Liverpool 45° 9, and was lowest at Blackheath, 41° 1, at Brighton 42° 3, and at Wolverhampton and Hull 42° 9. The general mean was 45°.

The mean of the seven low night temperatures was highest at Bradford, 37° 6, at Liverpool 37° 1, and at Plymouth 37° 1; and was lowest at Wolverhampton, 31° 8, at Blackheath 32°, and at Nottingham 32° 4.

The general mean was 34° 7. The mean daily range was greatest at Sunderland, 13° 7, at Nottingham 12° 4, and at Truro 12° 2; and was smallest at Bradford, 7° 3, at Plymouth 8° 7, and at Brighton and Liverpool 8° 8. The general mean was 10° 3.

The mean temperature for the week was highest at Sunderland, 42° 6, at Truro 41° 9, and at Liverpool 41° 2; and was lowest at Blackheath and Wolverhampton 37° 1, and at Brighton, 37° 6. The general mean was 39° 6.

Rain.—The largest falls were 0.70 inch at Wolverhampton, 0.53 inch at Liverpool, and 0.51 inch at Leicester. No rain fell at Blackheath, Brighton, Sheffield, Hull or Leeds, and only 0.01 inch at Bristol. The general mean was 0.16 inch.

SCOTLAND: *Temperature.*—During the week ending January 28, the highest temperature was 54° 3, at Aberdeen 1; at Greenock the highest temperature was 49° 2. The general mean was 51° 1.

The lowest temperature in the week was 29° 1, at Edinburgh; at Glasgow the lowest temperature was 37°.

The mean temperature for the week was highest at Glasgow, 44° 3, and at Paisley, 44° 2; and the lowest at Aberdeen, 43° 6. The general mean was 43° 4.

Rain.—The largest falls were 1.36 inch at Greenock, and 0.56 inch at Paisley. The least falls were 0.10 inch at Dundee, and 0.15 inch at Aberdeen. The general mean was 0.43 inch.

JAMES GLAISHER, F.R.S.

Obituary.

We have heard with regret of the death on Jan. 25 of MR. WILLIAM MACKENZIE, of Achindinny, Ayr, Ross-shire, a gentleman who was widely known as an estate improver, and the details of whose long and well-spent life cannot otherwise but prove of great interest to gardeners. Mr. Mackenzie was born at Urquhart, Ross-shire, in 1806, his father being a small farmer in that parish, in which his ancestors had also resided for many generations. In 1824 he commenced his gardening career as an apprentice at Balmadry Gardens, which belonged to Sir Colin Mackenzie, of Kileay. Having served his three years he went to the nursery of Dickson & Co., of Edinburgh, and from thence, in 1827, to Dalkeith, where Mr. Macdonald was gardener to the third Duke of Buccleuch. Here he remained for two years, and then went to Barcaldine, the seat of Sir Duncan Campbell, in Argyllshire, to assist in laying out new gardens, and in carrying out other estate improvements. Four years Mr. Mackenzie stayed at Barcaldine, and next became gardener, forester, and general superintendent of estate works at Rosneath, Ross-shire, which then

belonged to Sir James Wemyss Mackenzie. He served Sir James until his death in 1843, and his son and heir for four years after, during which time new gardens were made at Rosneath, and also at the Highland residence of the family at Kinlochinchear. These large gardens, as well as that at Barcaldine, were made with great care and sound judgment, and to this day bear witness to the excellent manner in which Mr. Mackenzie did his work. In 1847 he went to Ardross, Ross-shire, the property of Alexander Matheson, Esq., M.P. for the county, and it was here that he made his great reputation as an estate improver. Mr. Matheson commenced the improvement of his large estates in 1847, when the population of the district of Ardross was only 109 souls. Of the success of his efforts, ample evidence is afforded in the fact that five years ago the population in the same area was 600, and there has no doubt been some increase since that time. The limited space at our disposal forbids us entering very largely into the details of Mr. Mackenzie's work, but we cannot omit the mention of the more salient features, while for fuller information we refer our readers to a descriptive account of Ardross Castle in our own columns, at p. 272, vol. iii., and to Mr. Mackenzie's most interesting autobiography published with appreciative comments by the Editor, in the *Agricultural Gazette* for October 16, 1875. The pleasure grounds at Ardross consist of about 800 acres, which Mr. Mackenzie laid out, and for the most part planted. Upwards of 5000 acres of moorlands were planted, chiefly with Scotch Fir and Larch. More than 50 miles of private roads were made, and 12 miles of walks through the pleasure grounds, one being 6 miles continuous along the fine scenery of the Ainess. Upwards of 40 miles of stone dykes were made, and 80 miles of wire-fencing erected, enclosing arable land and plantations. At Delny, one of the detached properties, extensive drainage works, requiring great engineering skill, were most successfully carried out, and at Dunraig, on the west coast, a few miles from Strone Ferry, a garden mansion was built and extensive estate and garden improvements also carried out. For twenty years from 300 to 400 men were employed, and the only assistance Mr. Mackenzie had in the engineering and planning was that of a young man only seven years old when the works were begun. For nearly eleven years 200 of the men lived in a square of barracks, and so powerful for good was the influence that Mr. Mackenzie had over them that the services of a policeman were never required for any purpose. One of the first things that Mr. Matheson did was to establish a school in the district, with the result that at the present time the sons of the small farmers are to be found in various respectable positions in life—students in medicine, law and divinity, merchants, gardeners, and artisans, while one is the chief constable of the county, and another took the Queen's prize of £100 in one of the Universities, and became one of Her Majesty's Inspectors of Schools. In 1873 the tenants showed their appreciation of the benefits derived from Mr. Mackenzie's great skill and untiring energy by presenting him with his portrait and an address expressing the esteem in which they held him. When the writer had the pleasure of paying him a visit in 1875 Mr. Mackenzie, besides carrying on the duties of factor to Mr. Matheson, was himself farming some of the land which he had reclaimed, and excellent crops were seen growing where nothing but a marshy wilderness existed before.

— We also regret to record the sudden death, a few days ago, at the Floors Home Farm, Kelso, of MR. WILLIAM SMITH, father of Mr. John Smith, Curator of the Royal Gardens, Kew. The deceased, who was in his 88th year, went to Floors in 1814, and had followed his employment there under three successive Dukes of Roxburgh, by whom he was greatly respected.

Law Notes.

HIGH COURT OF JUSTICE: QUEEN'S BENCH DIVISION (Before Mr. Justice Field): *Morgan v. Gordon & Co.*—This was an action brought by the plaintiff, a saleswoman in Covent Garden Market, against the defendants, the proprietors of the Grand Hotel, Charing Cross, to recover £36 6s. 6d., the value of vegetables sold to the defendants, who denied their liability.

It was proved that the goods in question were sup-

plied between May and June, 1881, on the order of a Mr. Hunt, who at that time was in the employ of the defendants, and the only question in the cause was whether he had their authority to pledge their credit. On the conclusion of the evidence for the plaintiff Mr. Grantham submitted that there was no case to go to the jury.

Mr. Willis contended that as these were goods used in carrying on the business of the defendants as hotel proprietors it must be assumed that Hunt had authority to order them either as a servant or a partner, as he had done before.

Mr. Justice Field said there was abundant evidence that he had authority to buy goods, but the question was had he authority to buy on credit.

Mr. Willis replied that if there was evidence that Hunt was a buyer for the defendants it must be assumed that he could buy on credit. He submitted there was evidence that Hunt was a servant of the defendants at the Grand Hotel.

Mr. Justice Field: There is no evidence of that. This is a very important action, as other actions depend on it, and a good deal turns on the authority of Hunt to buy on credit. There is no proof that he was in the service of the defendants.

A witness named Watson, in the employment of a salesman at Covent Garden Market, was then recalled, and deposed that on one occasion he called for payment of an account, and saw Hunt in the grill-room. The latter then went downstairs to his wife for the money, but as it was too little he took the balance out of the tills in the refreshment bar.

On this evidence his Lordship said he would not stop the case, but would assume for the present that Hunt had authority to pledge the defendants' credit.

The case was accordingly proceeded with, and evidence was adduced to show that Hunt, who had absconded, had always, while in the defendants' employ, been supplied with the money necessary for the purchase of all goods required in the establishment; but in cross-examination it was elicited that on certain dates their buyer, Hunt, was not provided with cash to pay for the goods bought.

On the conclusion of the evidence on both sides Mr. Justice Field summed up, and the jury found, in answer to questions left to them by his lordship—1st, that Hunt was expressly authorised by the defendants to buy in the market all such vegetables and fruit as the defendants required for their business; 2d, that dealing on credit was one of the known and usual terms of dealing in the market, and that the defendants authorised Hunt to buy in the market on credit, although originally their intention was to pay in cash; 3d, that Hunt was not expressly authorised by the defendants to buy on credit, but that the plaintiff had no knowledge of his instructions; 4th, that Hunt had not been sufficiently supplied by the defendants before making the purchases with cash, in order to pay cash for them. The jury further found that similar circumstances had previously occurred—that Hunt had pledged the credit of the defendants to the plaintiff, and that the plaintiff had given credit to the defendants.

On these findings the learned Judge gave judgment for the plaintiff for the amount claimed.

Answers to Correspondents.

ALTERNIFOLIOLUS, ALTERNIFOLIATE: M. H. We are not aware if these words were ever used in ordinary literature; even in botanical works their use is rare, botanists as a rule preferring to say of such plants as the common Cherry Laurel or the Oak, "Leaves alternate," not tree or shrub alternifolius, or alternifoliata.

BOOKS: Beginner, Botany for Beginners, published by Messrs. Bradbury, Agnew, & Co.—Ferns, Mr. B. S. Williams' Select Ferns and Lycopsids, price 5s. 6d.—T. F. R. The Culture of Fruit Trees, by M. Du Breuil (Lockwood & Co.); Simpson's Improved Pruning and Training of Fruit Trees (Gardner's Office). We do not know of any book dealing exclusively with orchard management.—J. Shambrook. You ought to have the Gardeners' Assistant, but if that is too expensive, get Mr. B. S. Williams' Orchard Growers' Manual, and Choice Stone and Greenhouse Plants; and Rivers' Rose Auctioneers' Guide, or any one of the many useful little books on Rose culture.

COLTSFOOT: M. H. What you send is the fragrant Coltsfoot, figured in Gard. Chron. February 2, 1878; not the common Coltsfoot.

CRIMSON THORNS: Capt. B. The one alluded to was Paul's Double Crimson, the finest of them all.

CUCUMBER BED: Amateur.—The safest plan would be

to use the slates over the tank, not butting them too closely. On the slates put a layer of rubble, and fill up the bed with fresh manure and leaves. On this place small hills of good soil, and as soon as all is warmed through put out the plants. You must be careful to keep the tank supplied with water: see p. 151 for another plan.

FRUITS: R. Warner. So far as we know, the only way of obtaining the two Apples is by getting grafts from Chiswick. The Currant is in the hands of Messrs. James Carter & Co.

FUNGUS ON IVY: Helena, Anglevor. The thick sooty deposit on the Ivy leaves is a fungus named Capnodium Podagraceum, almost peculiar to evergreen Ivy. The fungus is not an exhalation from the scale so abundant on the leaves sent. Scale and Capnodium frequently occur in company, and some persons are of opinion that the fungus is capable of extending itself with greater virulence where leaves have been weakened by scale, and where matter given off by scale insects is present. The Capnodium and scale (growing in company) are sometimes common upon blackened Oranges and Lemons in our markets. We have seen branches of Olive so blackened by an allied fungus that not a particle of green colour has been left visible. In a case like yours, where a very bad attack of scale is combined with an equally bad attack of Capnodium, no cure is known. H. G. S.

LAPAGERIA ROSEA: Lap. It will do best in the cool conservatory. Be careful to give it plenty of room, good drainage, and an abundance of water while growing.

NAMES OF FRUITS: Keynes & Co. Vicar of Winkfield, or Beurre Châtraine.

NAMES OF PLANTS: H. F. Morris. 1. Ilex Aquifolium medeolens; 2. I. Aquifolium heterophyllum acropetalis; 3. I. Aquifolium marginata; 4. I. Aquifolium aurea (gold-blotched Hedgehog); 5. I. Aquifolium ferox (Green Hedgehog); 6. Libocedrus chilensis.—R. K. 1. Pteris cretica albo-lineata; 2. Pteris serrulata; 3. Adiantum bipinnatifidum; 4. A. formosense; 5. P. Hagedornii. The Orchid is Calanthe vestita lateo-oculata. The Sidalceus are:—1. S. Poulteri; 2. S. apus; 3. S. stenophylla; 4. S. uncinata (cuesia); 5. S. Kraussiana.—H. J. We believe the flower is correctly named Cattleya Dominiana, but we have not a bloom to compare it with.—Symon. 1. Phlox grandidentata; 2. Goldfishia isophylla; 3. we are unable to name it in its present state. Please send again when in flower.

NOMENCLATURE OF VARIETIES OF CHRYSANTHEMUM: C. O. Undoubtedly where Latin names are used they should follow the ordinary grammatical rule. Erecta, superba, &c., as applied to Chrysanthemum are wrong, and, as you say, should be written erectum, superbum, &c. But it would be very much better still to avoid Latin names for these garden varieties, and to call them by some garden name such as Sun, Pompey, &c., which would lead to no confusion, and which would be understood in other countries as well as Latin itself.

ORANGE: J. M. Your Orange is peculiar in having the style still remaining attached to the top of the fruit; usually it falls before the fruit ripens.

PLANTS THAT WILL GROW UNDER TREES: G. R. Plant the London Pride, Saxifraga umbrosa, and by cutting it over once a year you will have a very nice carpet under the trees. Your other question next week.

PRIMULAS.—J. Cross. You have many competitors well ahead of you in your efforts to improve this flower. The blooms sent are for the most part small and rough, and consequently worthless; but there are a few among them worth saving, these being the rose and low-lime coloured ones, which are also very nice in form, and the pale tinted one especially of good substance.

ROOT DISEASE IN LYONS.—A correspondent sends us roots of Lyons, and when reported last March they had grown freely until May or June last, when the plant suddenly flagged, and the bloom-buds became small and insignificant flowers. The roots show large swellings, and on examination the corky outer rind is seen to be greatly thickened and to contain numerous bags of a soft, glutinous, nematode worms, such as those which occasion one form of the Cucumber disease. We recommend the destruction of the plants, and the use of fresh soil for any further cultivation.

THORN HDLDS: A. G. N. Your practice of cutting down the plants to the required length before planting them is the same as is followed by many successful planters, and has the merit of being thoroughly sound. By cutting the hedge to the required length last year, and when planting leaving only 2 or 3 inches above-ground, you get three or four shoots to each plant, close to the ground—the best of all foundations for a hedge.

** Correspondents are specially requested to address, post-paid, all communications intended for publication in the Editor's office to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

SEEDS.

LONDON, Feb. 4.—Fair steady business is now passing in field seed. As regards value, great firmness is shown all round. Cable advices just to hand describe the Clover markets on the other side of the Atlantic as hardening. For Trefoil there is an improved sale of home-grown Alsike, white and red, the supplies keep coming. Ryegrasses continue to move upward. The late advance in Tares is more than maintained. For bird seed the sale is meagre. John Sharp & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday English Wheat, though not in large supply, barely supported the rates of that day's night, whilst foreign was in some cases *bid*, and *is* lower. Flour was quiet, without appreciable change. Good milling Barley was fairly firm, but grading Barley was weak. Beans and Peas, whilst quiet, were firmer. Maize on the spot was steady. For Oats the market was dull, and some rates slightly lower on the week. On Wednesday the supplies of home-grown Wheat were very short, and held out for steady value. In foreign there was hardly sufficient business to test quotations; the tendency was, however, against holders. Flour was a slow sale, without change in value. Barley, Beans, and Peas sold in retail quantity at Monday's rates. Oats and Maize quiet and unchanged.—Average prices of week for the week ending January 28.—Wheat, 45s. 3d.; Barley, 33s. 4d.; Oats, 25s. 4d.; For the corresponding period last year:—Wheat, 42s. 6d.; Barley, 32s. 5d.; Oats, 20s. 2d.

CATTLE.

At the Metropolitan Market on Monday there was not a large market of cattle, but an exceedingly dull one, with weaker prices. For all classes prices were lower. Sheep were also short, but sold slowly; the few choice small wethers, but without improvement. The few lambs at market sold badly. Cattle calves from scarcity brought full value. Quotations:—Beasts, 4s. to 4s. 8d., and 5s. to 5s. 8d.; calves, 4s. 8d. to 6s.; sheep, 3s. 4d. to 6s., and 6s. 8d. to 7s. 4d.; pigs, 4s. to 4s. 8d. On Thursday trade, without being active, was firm in tone. Both beasts and sheep were in demand, and ruled steady in value. Calves firm.

HAY.

Tuesday's Whitechapel Market report states that trade was dull, but with only moderate supplies prices were steady. Quotations:—Prime Clover, 120s. to 120s.; inferior, 75s. to 65s.; prime meadow hay, 100s. to 100s.; inferior, 55s. to 50s.; and straw, 30s. to 55s. per load.—On Thursday the supply was also the trade quiet, and prices unaltered.—Unaltered Market quotations:—Superior meadow hay, 120s. to 120s.; inferior, 70s. to 105s.; superior Clover, 120s. to 125s.; inferior, 70s. to 103s.; and straw, 48s. to 54s. per load.

POTATOS.

The Borough and Spitalfields Markets report state that supplies are moderate of both home-grown and foreign, but more than adequate to the demand. Quotations:—Kent Regents, 90s. to 100s.; Champions, 60s. to 90s.; Victorias, 70s. to 120s.; Rose of Sheldons, 110s. to 125s. per ton.—Commons, 2s. 3d. to 4s. 6d. per bag.

Government Stock.—Consols closed on Monday at 99½ to 100 for both delivery and the account. Treasury's figures were, for delivery, 100½ to 100½ and 100½ to 100½ for the account. Wednesday's closing quotations were, for the delivery, 101½ to 102, and 102½ to 103 for the account; and the same figures were recorded on Thursday.

FOR H.R.H. THE PRINCE OF WALES.

J. WEEKS & CO. have the honour to announce that we have supplied and fixed two of their new HYDRO-CALORIC COILS in the Grand Saloon, Sandringham. It is not too much to say, that these Hydro-Caloric Coils are constructed upon the best known laws of Hygiene, and combine the most perfect system of Warming and Ventilating in one operation. They are invaluable for the healthful comfort of Mansions and Public Buildings. The constant stream of fresh warm air which they introduce, without draughts, has a very salutary effect upon all kinds of plants, and renders them a valuable health-giving adjunct in Orchid, Fruit, Plant, and Forcing Houses.

For Particulars and New CATALOGUE of

CONSERVATORIES, HOTHOUSES, AND HOT-WATER APPARATUS, ADDRESS:—J. WEEKS & CO., HORTICULTURAL, WARMING, and VENTILATING ENGINEERS, KING'S ROAD, CHELSEA, LONDON, S.W.

CAUTION TO EXHIBITORS OF PEAS.

The New Peas, "Stratagem," "Pride of the Market," "Telephones," and "Telegraphs" true, as distributed by the introducers, are offered only in Sealed Packages, bearing the Trade Mark of JAMES CARTER & CO. Purchasers are hereby cautioned against spurious imitations.

Independent Slow Combustion Boiler for Small Greenhouses.

TO HEAT BY HOT WATER; REQUIRING NO DRICKWORK.

Specially adapted for small greenhouses: for quick heating or slow combustion. Quite portable, and will heat properly for twelve hours. Made with strong wrought-iron cylinder set in a cast-iron base, with fire-brick and sliding door. Only one-tenth the cost of heating by gas, and much more effectual. Steam from 2-in. cast sockets, 60° for feeding, and socket for smoke-flue.

Cash Prices—Carriage paid.

of Boiler complete, as shown in illustration, but exclusive of piping.

Size.	Total Height.	Diameter.	To heat 4-in. Piping.	Price.
1	27 in.	16 in.	40 ft.	£3 10 0

The Phoenix Slow Combustion Boiler.

We claim for our Phoenix Upright Boiler the following good qualities, viz.:—It is made of the best materials; has no parts that are liable to failure; is provided with a flue that cannot be choked with fuel; will heat effectually the quantity of pipes stated with the smallest amount of fuel; can be easily regulated; and will hold fuel sufficient for keeping up the proper heat twelve hours; requires no brick-work, and takes up the smallest space of any boiler of its power.

Sockets can be placed in any position.

Cash Prices—Carriage paid.

H. CANNELL & SONS'
IS NOW READY,
 And sent post-free for 1s.
 We assure all lovers of Flowers that it is by far the best we have ever issued, and probably the best ever published. Certainly it contains the greatest and most complete information on Flowers and their Seeds. The printing 20,000 copies cost £570, the postage of the same £250. We simply mention this to show to what extent our efforts are appreciated.
 Splendid Coloured Drawings of our **CALCEOLARIAS, CINERARIAS, CYCLAMENS,** and **PRIMULAS** by the best artist, as near like the actual flowers as skill and paint can produce. The plates make beautiful pictures, 10s. per set.
 For the Seeds and the way to Sow, Grow, and obtain the finest specimens of the above, such as would carry off the First Prize, see H. C. AND SONS' *Floral Guide*, for 1s. All the above post-free for 12 6d.

 Beautifully Illustrated Catalogue Free to Customers.
DANIELS BROS., The Queen's Seedsmen, NORWICH.

Another Novelty of Rare Excellence
HARRISON'S
NEW MARBLE TURNIP.

We have much pleasure in introducing this excellent new variety, which is the most solid Turnip we have ever met with; it will bear washing and rough treatment in sending to market, and will not turn dark in the skin, which is so common with ordinary Turnips. Its shape is globular, the flesh is beautifully white and sweet, foliage healthy and compact; as much superior to the Strong Turnips as marble is to stone—as its name implies. Feeling confident in a large demand, we have prepared a moderate stock.

Once Packets, 6d. each.
 Special Prices per lb. and cut, to Seedsmen and District Gardeners on application.
 From Mr. JOHN GREENSHIELDS, Gr. to the Earl of Duca:—"I had a very nice piece of your Early Marble Turnip, and am very much pleased with it; it is very early, of good shape, and the quality excellent. The chief in the kitchen, a very experienced cook, preferred it to either the White Stone or Red Globe, which is rather remarkable. Her Ladyship asked me one day what excellent Turnip I was sending in."

From Mr. EDMUND COLE, Gr. to Earl Spencer:—"Your New Marble Turnip I found to be a good distinct variety of the Green-tipped type, with sound handsome bulbs all green above the soil, with white sweet flesh, and is an immense cropper, and will, I should think, become a great favourite with gardeners when better known."
 With upwards of Fifty other good ones.

HARRISON & SONS,
 SEED GROWERS, &c., LEICESTER.

WALKER'S
PERPETUAL BEARER
PEA.

This valuable New Pea is now being distributed by the undersigned, and can be obtained from all Seedsmen and Florists in the United Kingdom.

Lights and framing for brick pits at proportionately low prices. R. HALLIDAY and CO., Horticultural Builders and Engineers, Royal Horticultural Works, Middleton, Manchester.

RIPPINGILLES PATENT PROPAGATING PLANT FRAME.

Heated by Patent Stove, to Burn Petroleum and other Mineral Oils.

The Simplest and Best Invention ever introduced for RAISING SEEDS, STRIKING CUTTINGS, &c.

The only Frame of the kind for Outdoor Use. The above illustration represents Rippingille's Patent Outdoor Plant Frame, which is so constructed that it will not blow out during the roughest weather; it is made upon the most scientific principles, but is so simple that it is impossible to get out of order, and in economy is unequalled, the cost of burning being only FROM A FARTHING TO A HALFPENNY PER DAY.

The Stove will burn from thirty-six to forty hours without attention. The products of combustion do not enter the Framing, all, but at the same time all the heat is completely utilized, as it is discontinued from the Frame for trimming the wick, lighting, replenishing with oil, &c. The top of frame slides off either way, and is entirely removable; this is very convenient for Planting or removing Cuttings, Watering, Ventilating, &c. The heat attained is from 70° to 90° Fahrenheit, which is considered the best temperature for forcing or propagating purposes.

PRESS OPINIONS. "The Journal of Horticulture."—A valuable aid to Amateur Gardeners? "The Gardener."—"It is a handy Plant Frame, likely to be much used when better known."

"The Gardener's Magazine."—"Rippingille's Propagating Frame is the most valuable invention." "The Horticultural Record."—"This Frame ought to be in every small Garden, so that its owner could raise his or her flowers from seeds and cuttings, which gives so much greater zest to the pleasures attached to Amateur Gardening. Sent packed free and carriage paid to any Railway Station in England."

Illustrated LIST, with full particulars, further Press Opinions and Testimonials, sizes, &c., free on application to THE HOLBORN LAMP & STOVE CO., 115, HOLBORN, LONDON, W.C.

The Pheasantry Iron and Wire Works, Beaufort Street, Chelsea, S.W.

For Garden and Conservatory Wirework see CATALOGUE.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler with the following improvements—viz, the water space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.		To heat of 4th. Pipe.	Price.
High.	Wide.	Feet.	£ s. d.
20 in.	18 in.	15 ..	3 0 0
20 ..	18 ..	24 ..	4 0 0
20 ..	18 ..	30 ..	5 0 0
24 ..	24 ..	24 ..	7 0 0
24 ..	24 ..	30 ..	8 0 0
24 ..	24 ..	36 ..	10 0 0
24 ..	24 ..	48 ..	14 0 0
24 ..	24 ..	60 ..	20 0 0
24 ..	24 ..	60 ..	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes, or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.

James Dickson & Sons

Seed Growers &c
108 Eastgate St Chester.

SPECIAL NOTICE.

This design was invented by Messrs. SUTTON in July, 1881, and forms the chief distinguishing mark of their Export Boxes of Seeds. It has also been constantly since that date used by them for advertising in India and the Colonies.

Messrs. SUTTONS' Customers abroad are hereby warned against Imitations.

THE QUEEN'S SEEDSMEN, *Sutton & Sons*, READING, BERKS.

SINGLE DAHLIAS.

It is right to inform the Public that we have the honour of holding the *only First-class Certificates ever awarded by the Floral Committee of the Royal Horticultural Society for Single Dahlias*, and also that we are the re-introducers and actual growers of them and sellers of their seeds. Our mixed seed is this year much enhanced in distinctiveness, for it is picked from the new kinds of T. MOORE, Esq., and the following splendid varieties, many in reserve for 1883 and 1884, and therefore years ahead of those usually offered:—

- | | | |
|----------------------|--------------|---------------------|
| GLARE OF THE GARDEN. | MULBERRY. | MAGENTA KING. |
| NEW PARAGON. | AVALANCHE. | OBERON. |
| MORNING STAR. | AJAX. | PRESIDENT GARFIELD. |
| SCARLET GEM. | FIREFLY. | ROSE. |
| AMARANTH. | FIERY STEED. | STELLA. SPLENDOUR. |

Mixed Seed, 1s., 2s., and 3s., per Packet.

The *Journal of Horticulture* says:—"Messrs. Cannell & Sons' Single Dahlias are magnificent."

H. CANNELL & SONS, The Home for Flowers, SWANLEY, KENT.

CHOICE STOVE AND GREENHOUSE PLANTS.

JOHN H. LEY,
ROYAL NURSERY, LONDON ROAD,
CROYDON,

Begs to direct the early attention of purchasers this spring to his magnificent STOCK of PLANTS in classes enumerated below, all of which are offered at remarkably low prices, and are far superior to the usual Nursery stock, being young, clean, and quickly grown Country plants (as a visit to the Nursery will readily prove). Any one ordering a collection can send lists of sorts already possessed, when other distinct sorts only will be included. An enormous stock to select from in plants of all sizes.

TWELVE PLANTS for Table Decoration, 4-inch pots, 21s.—Choicest Arafias, Cupanias, Panax, Cocos, Cyperus, and others; or fine specimens for immediate use, in 5-inch pots, 30s. and 42s.

TWELVE ORNAMENTAL FOLIAGE PLANTS for 21s.—Strong plants of newest and best Marantas, Alpinia, Campylobotrys, Panninias, Dieffenbachias, and all the most handsome foliage plants grown. In extra large specimens, 42s. per dozen. 10,000 beautiful plants to select from.

ADIANTUM FARLEYENSE.—12 magnificent and perfect specimens for 21s. The individual pinnae of these lovely plants are far larger than is to be found usually, even on the largest exhibition specimens, and are the admiration of all visitors and gardeners. 10,000 plants to select from.

EUCHARIS AMAZONICA.—12 flowering size Bulbs, extra strong, 21s. All selected bulbs from large specimens, divided last year, and will flower freely. (Small bulbs take usually years to be flowered.)

PHALLENOPSIS.—Strong Plants in baskets of Schilleriana, amabilis, and finest variety of grandiflora, many now sending up strong flower-spikes, £10 10s. per dozen, and 21s. and 31s. 6d. each, according to size.

CATTLEYA MOSSIE, C. CITRINA, Dendrobium Devonianum, D. Freemani, and Odontoglossum Londesboroughianum.—Hundreds of well established plants sending up new growths, and will flower freely. Many flowered last year, and prove to be extra fine varieties. 42s. and 60s. per dozen.

ONE HUNDRED CHOICE DECORATIVE PLANTS for 63s.—Suitable for warm Greenhouse and Conservatory. Good sized plants in 1½-inch pots, fit to put on at once, of Kivinas (full of red berries), Gesneras in flower, Dracanas, Palms, Ferns, Plumbago roses, Tree Carnations, Acanthas, Ficus, Rondeletias; thousands of other varieties. Usually sold at £30, but offered cheap to make room in houses.

AZALEA INDICA.—12 beautiful Plants, full of buds, for 21s. Over 100 finest named sorts in 5-inch pots. Also extra strong specimens, 42s., 50s., and 84s. per dozen. At latter price, specimens fit for exhibition.

AZALEA MOLLIS and PONTICA.—12 large healthy Plants of either, full of buds, 21s. Very fine strong Plants, fit to force.

TEA ROSES.—12 strong Plants to Force, choice sorts, 21s. Also ROSE Souvenir de la Malmaison, strong, in 6-inch pots, to Force, same price per dozen.

CROTONS.—12 newest and choicest sorts, distinct, 21s.—40 sorts to select from, strong, in 4-inch pots: 5-inch pots, 42s. and 50s. per dozen.

DRACENAS.—12 newest and finest sorts, good Plants, 21s. In 5-inch pots, extra fine specimens, 42s. and 50s. per dozen. A very fine stock.

BASKET FERNS.—12 rare and beautiful species, in Cork Baskets, for hanging on bare walls, 6s. and 8s. Consisting of Baskets, about 15 inches deep by 9 inches across, and with large specimens of the most valuable, as Osmunda, Asplenium, Nephrolepis, Duffei, Phlebodium, Platycerium, &c. A few grand specimens, 21s. and 42s. each.

CHEAP FERNS.—100 choice Ferns, for Rockwork, 21s.—about 25 sorts in small pots (in 100 rare and beautiful sorts, for 42s).

AMERICAN and JAPANESE FERNS.—25 distinct species, hardly, for Rockwork, 21s. Rare Osmundas, Wardsias, Acrostichum, Asplenium, Asplenium, Wardsias, Struthiopteryx, Cyrtomium, &c., most distinct, and afford a greater variety of foliage than is to be met with among the whole range of British or European species, and equally hardy.

All packages gratis for cash with order only, to save Postage. Plants gratis to pay for carriage (smaller quantities same rates).

AUCTION ROOMS and OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

CATTLEYA LABIATA PERCIVALIANA
 (Rehb. f.)
TRUE AUTUMN-FLOWERING LABIATA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by Order of Mr. F. SANDER, on **THURSDAY, February 23,** a wonderful Importation of this magnificent **CATTLEYA.** It is well known there are numerous varieties among the old *Cattleya labiata*, such as **PESCATOREI, PICTA, &c.,** and the varied Bulbs show that many varieties are among the lots offered. It is true Autumn-flowering. Flowers will be on view of this the finest Brazilian **CATTLEYA** sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed, lower part deep velvety-purple; in some varieties quite one half of the lip is dark; throat golden-yellow. We have never previously seen imported a *Cattleya* so floriferous: there is hardly a Bulb which has not flowered, and whose spike does not show three and four flower seats. Mr. Seidl, the lucky discoverer, states that one mass alone had 380 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importation, which is altogether in simply superb condition. The whole will be given into Mr. Stevens' hands, and comprise all that could be found, and none sold privately; but Mr. Sander earnestly invites prior inspection at the St. Alban's Nurseries, which are easily reached by the Midland, London and North-Western, or Great Northern Railways, from any of the Metropolitan Stations, Liverpool Street, King's Cross, or from St. Pancras, by fast train in half an hour.
On view the morning of Sale, and Catalogues had.

- .. French Varieties of 1880, 18s per dozen, 130s per 1000.
- CURRANTS**—Black, good bushes on stems, 3s to 6s per dozen, 20s to 30s per 100; cheaper by the 1000.
- NUTS and FILBERTS**—Largest and Best Varieties, fine bushy plants, 6s to 6s per dozen, 40s to 60s per 100, 41s to 47s 10s per 1000.
- ASPARAGUS**—extra fine, strong planting roots, 2s. 6d. to 3s. 6d. per 100, 20s to 30s per 1000.
- HERBS** of many kinds, 3s to 6s per dozen.
- PLUM (Prunus)**—Vigorous, common (P. domestica variegata), a very striking and easily grown variegated tree, 2 to 3 feet, 9s per dozen; 3 to 4 feet, 12s per dozen.
- ELM**—Wych, transplanted, 4 to 6 feet, 8s per 100, 60s per 1000; 6 to 8 feet, 25s per 100, 230s per 1000.
- POPLAR**—Black Italian, 6 to 8 feet, 3s per dozen, 20s per 100, 26s per 1000; 8 to 10 feet, 5s per dozen, 30s per 100, 240s per 1000.
- WILLOW**—Beilford or Huntingdon, 6 to 8 feet, 3s per dozen, 15s per 100; 8 to 10 feet, 4s per dozen, 45s per 100, 25s per 100; 10 to 12 feet, 6s per dozen.
- .. Corulean, 6 to 8 feet, 3s per dozen, 15s per 100; 8 to 10 feet 4s, per doz, 25s per 100; 10 to 12 feet, 6s per doz.
- ASH**—(Fraxinus excelsior) atrovirens, 3 to 4 feet, 12s per dozen; 4 to 6 feet, 12s per dozen; 6 to 8 feet, 18s per dozen; 8 to 10 feet, 24s per dozen.
- .. spectabilis, an exceedingly fine Ash, which grows with extraordinary vigour, 3 to 4 feet, 6s per dozen; 4 to 6 feet, 9s per dozen; 6 to 8 feet, 12s per dozen; 8 to 10 feet, 24s per dozen.
- BEECH**—Crested-leaved, a very ornamental tree, 4 to 5 feet, 9s per dozen; 5 to 6 feet, 12s per dozen; 6 to 8 feet, 24s per dozen.
- .. Cut-leaved, very beautiful, 4 to 5 feet, 12s per dozen; 5 to 6 feet, 18s per dozen; 6 to 8 feet, 24s per dozen; 8 to 10 feet, 36s per dozen.
- .. Fern-leaved, one of the most beautiful small trees grown, 3 to 4 feet, 12s per dozen; 4 to 5 feet, 18s per dozen; 5 to 6 feet, 24s per dozen.
- .. Purple-leaved, the best dark broad-leaved variety, 3 to 4 feet, 9s per dozen, 60s per 100; 4 to 5 feet, 12s per dozen, 75s per 100; 5 to 6 feet, 18s per dozen, 120s per 100; 6 to 8 feet, 24s per dozen.
- .. Weeping, 4 to 5 feet, 12s per dozen; 5 to 6 feet, 18s per dozen; 6 to 8 feet, 24s per dozen.
- HORSE-CHESTNUT** Extra transplanted, very fine, well-rooted trees, 3 to 10 feet, 9s per dozen, 60s per 100; 10 to 12 feet, 12s per dozen, 75s per 100.
- .. Scarlet-flowered, 6 to 8 feet, 18s per dozen; 8 to 10 feet, 24s per dozen.
- ELM**—Varegated, Weeping, fine Standards, 5 to 8 feet in stem, 24s per dozen.
- .. Giant or Huntingdon (macrophylla), 10 to 12 feet, 12s per dozen, 75s per 100; 12 to 15 feet, 18s per dozen.
- .. Silver Variegated, 4 to 6 feet, 12s per dozen; 5 to 6 feet, 18s per dozen, 6 to 8 feet, 24s per dozen.
- .. Scampston's Weeping, the finest Weeping Elm, fine straight stems and good heads, 10 to 12 feet, 24s per dozen; 12 to 15 feet, 36s per dozen.
- MAPLE**, Norway (Acer platanoides), 8 to 10 feet, 9s per dozen, 6s per 100; 10 to 12 feet, 12s per dozen.
- WILLOW**—Scarlet Palm, a Willow of extraordinary vigour. The bark of the young wood is of a deep purple above and winter, and it bears "hamb's tails" in spring of very large size. 4 to 6 feet, 3s per dozen, 16s per 100; 6 to 8 feet, 4s per dozen, 20s per 100; 8 to 10 feet, 6s per dozen, 40s per 100; 10 to 12 feet, 12s per dozen.
- EUONYMUS**—radicans argenteus variegatus, a very useful plant for edges to winter beds, 3 to 4 in., 2s per doz., 12s per 100; 4 to 6 in., 3s per doz., 18s per 100.
- ELDER**—(Sambucus nigra) variegated: a beautifully variegated plant, which thrives close up to the sea; 6s per dozen, 40s per 100.
- .. cut-leaved—a handsome lacinated form, and, like other Elders, extremely useful for ornamental planting close to the sea. 6s per dozen, 40s per 100.
- A slight extra charge must in most cases be made for packing. Where cash in payment of goods is sent with the order, the amount for postage may be forwarded in stamps after despatch of goods. All the above prices are subject to the discounts named at head.

THE GENERAL AUTUMN LIST will be forwarded Gratis and Post-free to all applicants.

N.B. Post-office Orders should be made payable to EWING AND CO., at Eaton, near Norwich. Cheques crossed GURNEY AND CO., Norwich.

Trade Terms on application.

Carters' BLUE PRIMULA "HOLBORN GEM." THE GREATEST NOVELTY OF THE YEAR.

First-class Certificate Royal Horticultural Society, January 10, 1882.

Seed of this magnificent Novelty will be ready for distribution in May next. Orders will be executed in strict rotation. To prevent disappointment it should be ordered at once. Price, 5s. and 10s. 6d. per Packet, post-free. Trade Price on application.

The "Gardener's Chronicle," January 21, 1882, speaks of it as follows:—
 "The great feature is the New Blue Primula, 'Holborn Gem,' of which we saw a few days since, 50 plants in flower, all of high quality and true to colour. The flowering habit of the strain is excellent, the trusses being thrown up well above the foliage, and the flowers look the spectator straight in the face."

- CARTERS' NEW PRIMULA—The Bride**—Purest snow-white flowers borne in immense trusses, elegantly fluted, compact in habit. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- CARTERS' NEW PRIMULA—Royal Purple**—Immense trusses of bloom of a royal purple colour, shading off to crimson-lake. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- CARTERS' FLORENCE ROSE PRIMULA**—Flowers delicate salmon-rose. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- CARTERS' CARMINE EASY PRIMULA—Rich rose-crimme**. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- CARTERS' NEW DOUBLE PRIMULA—Prince of Wales**—Rich crimson. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- CARTERS' NEW DOUBLE PRIMULA—Snowflake**. A charming variety; pure white flowers of great size. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- CARTERS' NEW PRIMULA—Vesuvius**—The richest crimson-Scarlet. We had the honour of supplying a packet of Primula Vesuvius to Her Majesty's Head Gardener at Balmoral, who writes:—"Vesuvius is a splendid variety, with bright scarlet flowers—a great acquisition." Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- CARTERS' NEW PRIMULA—Spotted Queen**—Very curious and beautiful; each flower being spotted and spotted; colour rich crimson-purple. Price, in sealed packets, 2s. 6d., 3s. 6d., and 5s. per packet.
- THE COMPLETE COLLECTION**—The large packet of nine varieties, as above, price 42s.
- THE COMPLETE COLLECTION**—One small packet of nine varieties, as above, price 22s. 6d.
- CARTERS' PERFECTION PRIZE PRIMULA**—Finest Mixed (a great variety of colours). Price per packet, 1s. 6d., 2s. 6d., 3s. 6d., and 5s.

SPECIAL NOTICE—The varieties of Primula offered by Messrs. Carter are quite distinct, and very superior to many of those advertised by other houses.

WILLIAMS' Unrivalled Strain of PRIMULAS.

POST-FREE.

The Primulas I offer have earned a reputation for being the finest strains in cultivation—securing Prizes wherever exhibited, a fact which places their superiority and excellence beyond all question. They are now cultivated in all civilized parts of the globe, and I am continually receiving numerous unsolicited testimonials from my Customers throughout the world, in which they express in the most unqualified terms the satisfaction my strains have given them.

- Per packet—s. d.
- WILLIAMS' PRIMULA SINENSIS FIMBRIATA ALBA MAGNIFICA .. 2s. 6d. and 3 6
 - New white variety, of exquisite form and substance. The plants are of an exceedingly compact habit.
 - WILLIAMS' PRIMULA SINENSIS FIMBRIATA CHISWICK RED .. 2s. 6d. and 3 6
 - Williams' Primula sinensis fimbriata coccinea .. 1s. 6d. and 2 6
 - Williams' Primula sinensis fimbriata, superb strain—Red, White, or Mixed .. 1s. 6d. and 2 6

- Per dozen—s. d.
- WILLIAMS' PRIMULA SINENSIS FIMBRIATA METEOR .. 3s. 6d. and 5 0
 - Williams' Primula sinensis fimbriata rubro-violacea .. 3s. 6d. and 3 6
 - Williams' Primula sinensis fimbriata rubra Magnifica (King of Primulas) .. 3 6
 - Williams' Primula sinensis fimbriata (Queen of the Whites) .. 3 6
 - GLADIOLI, BRENCHELYENSIS .. 2 6
 - GLADIOLI, English-grown Seedlings .. 1 0

MEDICAL GARDENING.

IT is as curious as important to find that medical men and others who devote themselves to the study of the nature, progress, and modes of averting or remedying certain forms of disease, dependent upon the growth of humbly organised plants of extreme minuteness, find it necessary to cultivate the organisms in question, so as to be able to watch their career from the beginning to the end. The chief difficulty to be contended with is the growth of what we may term in this connection "weeds," that is, the spores or germs of plants other than those which it is desired to investigate. To exclude these ubiquitous growths is, it will readily be imagined, a delicate and difficult process, but one which it is essential to carry out, else numerous fallacies are sure to arise, and errors of observation to occur.

The next difficulty is to find some solution which affords nutriment to the plant—to find the right food for it, in fact. The most commonly successful fluids for this purpose are what we may term mixed manures, consisting of carefully-adjusted admixtures of nitrogen in some form or other, together with alkaline and phosphoric salts. The spores placed in some weak solution of this kind have to be retained continuously at a certain heat, varying according to circumstances, and which, with the appliances now at command in the laboratory, is an easy matter. Heat, light, or its absence, water and appropriate food, having been thus carefully adjusted, the organism grows just as a specimen plant would do under the coarser but still strictly analogous processes of the gardener. Then, having succeeded in isolating and in cultivating the plant, the next step is to make experiments by processes analogous to vaccination, to ascertain if the plant, when introduced in this way into the system, will produce the disease it is desired to investigate. This has now been proved in several cases, both among animals and in human beings, and it has, moreover, led to discoveries which furnish a means whereby these diseases may be in some cases mitigated, or their presence averted, just as in the vast majority of cases small-pox is staved off by successful vaccination and re-vaccination.

The treatment of wounds, whether accidental or inflicted of set purpose by the surgeon, has also been so much improved by carrying out these principles that certain operations, which the boldest operator dreaded to undertake, not from any lack of manipulative skill or from any mechanical difficulty, but from the operation of causes once thought beyond his control, are now successfully carried out. Amongst the most recent experiments of this nature are those of Dr. Thin on the cultivation of the fungus producing ringworm, and those on the organisms associated with, and perhaps causative of a peculiar form of baldness. These are matters which it may be thought concern medical men only, but that is a mistake—they concern us all, and specially the physiologist; while the gardener may not only see in the methods of observation and cultivation the refinement of fundamentally the same methods that he himself adopts in the cultivation of higher plants. The gardener, moreover, is directly concerned, as pointed out by Mr. Warrington and others, in the fact that the value as plant-food of the soil he uses is dependent, so far as nitrogen is concerned, on the conversion of inert insoluble salts into soluble nitrates by the agency of these minute organisms acting as yeast does in converting sugar into alcohol.

In view, too, of the vastness and universality of the beneficent results which may which have already accrued from such observations and experiments, both to animals and human beings, it is to be hoped that the common-sense of the people will rebel against the extremely ill-judged procedures of a few who, with the best intentions, would, if they could, prevent the progress of knowledge, and ensure the perpetuation and propagation of misery and disease.

New Garden Plants.

NEPENTHES LANATA.*

There has been, as we have already had occasion to mention, a good deal of confusion as to the true *Nepenthes Veitchii*, which, however, is well figured by Sir Joseph Hooker in his monograph in the *Linnean Transactions*. Among other plants misnamed, *N. Veitchii* the subject of this note must be included. By some oversight the plate in the *Illustration Horticole* below cited bears the name *N. lanata*, while the accompanying text is headed *N. Veitchii*, and the description given applies to that species. We lately met with the *lanata* (as figured) in the rich collection of Messrs. Veitch, and on comparing it with an unnamed wild specimen from Lobb in the Kew herbarium, found that the two specimens evidently belonged to the same species, and that, so far as can be ascertained, without flowers, the species is undescribed, though, as we have said, it is figured in the book already cited. We subjoin a technical description, but may here say that the plant is of rather vigorous habit; the leaves leathery, deep green, glabrous above, pale and thinly covered with blackish hairs beneath. The midrib is reddish and depressed on the upper surface, greenish and very prominent beneath. In form the leaves, which are more than 1 foot long by 2 inches in breadth, are oblong obtuse, gradually tapering at the base into a broad leaf-stalk. The tendril, like the pitcher, is thinly covered with coarse black hairs. The pitchers measure about 6 by 1½ inches, are cylindrical, greenish, not in the least ventricose, winged on the posterior side next the axis of the plant, the wings toothed and fringed; the mouth of the pitcher is ovate acute, prolonged anteriorly into a triangular neck; the peristome is finely and evenly ribbed, the ribs being ultimately of a reddish-brown colour; the lid is oblong or suborbicular, glandular on the under-surface, with seven or nine nerves, three or four on each side of the central nerve, which latter is prominent at the base, but becomes obscure towards the middle of the lid. As the pitchers are devoid of the brilliant colouring possessed by some others of this plant, it appears, has not found favour with growers, though we strongly suspect from the appearance of some of the hybrids that it has been used for purposes of crossing. In any case it is so distinct in the form and size of its pitchers that we would counsel collectors not to discard it. *M. T. M.*

NEPENTHES RATCLIFFIANA*, Hort. Veitch (fig. 28).

This is stated to be a hybrid between *N. phyllanophora* and *N. Hookeri*, and has light green leathery leaves, 12–15 inches long by 1½ inch wide, linear-lanceolate acute at both ends, with two or more parallel nerves on either side of the midrib, minutely serrulate, and with a rather long stalk. The pitchers are 5–6 inches long, by 2 inches wide, flask-shaped, green, spotted with red; wings ciliate broad or shallow, narrow at the base; mouth oblique, surrounded by a ribbed parti-coloured rim; lid about the size of the mouth, ovate, two-ribbed, glandular on the inner surface, and with a simple spur at the base. The pitchers are freely produced, and their bright colouring renders them very attractive. Our

illustration was taken in Messrs. Veitch's nursery at Chelsea. *M. T. M.*

NEPENTHES INTERMEDIA*, Hort. Veitch* (fig. 29).

Some objection may well be raised to several of the newer hybrid *Nepenthes*, on the ground of their too great similarity. This objection, however, is seen to

FIG. 28.—NEPENTHES RATCLIFFIANA.

* *Nepenthes lanata*, hort. Illust. Hort. (1876). tab. 26, quoad roscem; *N. Veitchii*, André in Illust. Hort., loc. cit. text. nec Hook. fil.; *N. villosa*, André, loc. cit. nec Hook. fil. — Folia coriaceis supra glabris subtus nigropilosis elongatis linearibus in petiolum latiusculum sub angustaculatum sensim angustatis apice rotundatis, nervo medio superiore rubente depresso subtus prominente piloso, nervis secundariis obscuris, acervis verticibus pilosis, 6 poli. long., 1½ lat., cylindrico-tubularibus, postice (quoad axim plantae) anguste alatis alis dentato fimbriatis, ore ovato antice in collum producto, peristomio angusto crebre sulcato-strato; operculo ovato suborbiculari ore minuto, subtus glanduloso 7–9 nervio, nervo medio infero crassiusculo, superiore obsolete — Borneo, Sarawak, Lobb. *M. T. M.*

be less valid when the living plants are seen, as woodcut illustrations, still less words, cannot convey the many shades of difference in habit, colour, and spotting which these plants possess. The present hybrid is not so much open to the objections above mentioned as some others, as its pitchers are distinct in form from most others. It was raised by Mr.

* *Hybrida* inter *N. Ratcliffianam* f. n. et sp. *Borneensem* indeterminatem.

Court in Messrs. Veitch's nurseries, between *N. Rafflesiana* and "an unnamed Bornean species with small spotted pitchers." Its handsome pitchers are very freely produced, and have much of the aspect of those of *N. Rafflesiana*, particularly in the long backward prolongation of the mouth. The pitchers, however, taper gradually from the centre upwards, which is rarely, if ever, the case in *N. Rafflesiana*. The stem is robust, covered with pale rust-coloured down; the leaves measure about 10 by 2½ inches, are coriaceous glabrous, except beneath, and taper to both ends. The main veins run parallel to the midrib. The pitchers measure at their full size about 6 by 2½ inches, and are of a green colour, spotted red. In form they are somewhat cylindrical, pointed at the base, slightly swollen in the middle, and tapering gradually towards the middle; the wings are broad, rounded at the base, fringed; the mouth is obliquely ovate, prolonged at the back into a column supporting the lid, as in *Rafflesiana*. The rim is flattish, rather broad, finely ribbed and particoloured; lid ovate obtuse, slightly hooded, but less so than in *N. Rafflesiana*, with two thick radiating ribs on the upper surface, and one central ridge-like prominence on the under surface. The spur at the back of the lid is shown as simple in the illustration, but in our sketch and notes taken from another plant perhaps, the spur is noted as branched, as in *Rafflesiana*. *M. T. M.*

DENDROBIUM CHRISTIANUM, n. sp.*

A new member of the old "*Nigro-hirsuta*" group. The old stems are well compared by Mr. C. Dorman with those of *D. infundibulum*. What I have at hand is cylindricato-fusiform, furrowed, very short (m. o.06), hairless. The young shoots, I am told, are covered with dark hairs. The peduncles appear one-flowered, whether constantly so we may learn later. The flower is very fine, ivory-white, with the base of the column and the disk of the lip cinnamon, so that it is most like the fine *Dendrobium Jamesianum*, named in memory of the late Mr. James Veitch. It is, however, smaller in all its parts. As a species it is totally distinct from all members of the "*Nigro-hirsuta*" group by its having a blunt angular chin, while all the species hitherto known had an extensoriform elongation of this part. This curiosity was imported from Siam by Mr. T. Christy, to whom it is dedicated with great pleasure, in consideration of his zeal in introducing plants from obscure regions. *H. G. Rehb. f.*

ODONTOGLOSSUM HISTRIONICUM, n. sp.

It is very reluctantly that I again propose a new name for a supposed hybrid sent to me by Mr. W. Bull. I would be the gayest variety of *Odontoglossum mulsii* I ever saw, were it not for its trifid lip and the unusually styliform erect or even, bent calli of the lip's base, including a certain *je ne sais quoi* in the appearance of the flower. The ligulate, wavy, acute sepals are light sulphur-coloured, with some brown transverse bars; the broader petals whitish, with light sulphur tops; the lip is trifid; the side laciniae are nearly square, oblong, yellow, with a reddish border, consisting of confluent spots; the middle lacinia is oblong-retuse, lobed, toothleted, wavy, partly with relaxed borders; the calli are styliform, and four on each side, one before the other, the anterior one lamelliform; the middle lacinia is light, more shining, yellow with a few brown spots, and streaky; the column is whitish with large brown areas; the wings are slit into many falcate laciniae; and the lip is unguiculate at the base, and adnate over the base of the column.

When looking at this plant (a fine piece of inflorescence being at hand with five flowers, each equalling one of a medium-sized *Odontoglossum triumphans*), I cannot help thinking of *O. cirrosium*. It may be that the trifid lip and the styliform calli came from that species, but there is little doubt that *Odontoglossum luteo-purpureum* or *O. Halli* have been in the play.

Such plants indeed cannot be regarded as the equiva-

* *Dendrobium Christianum*, n. sp. — Caulis teretifusiformis sulcatis; racemis unifloris (semper 3); flore speculato, teretibus natis; Dendrobium infundibulum, mento angustate (non extensoriforme); sepalis lateribus ligatis acutis, non carinatis, sepalo impari angustioribus; petalis oblongis acutis, labello a basi cuneato abrupte ciliato, lacinais lateribus oblique flabellatis, lacinia mediana obcordata carinulis teretibus naccatis depressis per medium intraculo-lamellosis; columna basi bene dilatata, quadrilobis, valvulis teretibus. — Flos ebracteata. Favis columnae et labelli discus cinnamon. Ex Siam imp. cl. T. Christy, cui oblectamentis dicatum. *H. G. Rehb. f.*

lents of well-pronounced species, but they require a name; and very gay, and curious, and rare additions they are to the collections. The collector may also indulge in the expectation that a great importation will never trouble his pleasure of possessing a *rarissima avis*. *H. G. Rehb. f.*

MASDEVALLIA LUDIEUNDA, *n. sp.**

This lovely *Masdevallia* has appeared in the famous collection of Sir Trevor Lawrence, having been

Granadan. It is very near *Masdevallia Estradæ*, but the tails are much longer, the bodies of the sepals are rounder, and the lip is distinctly pandurate. The outer perigone is light yellowish, with much darker tails. There is some light brown outside the sepals, the corresponding spots on the inner surface being purple, and a similar coloration exists on the upper part of the odd sepal, and on the lateral sepals, though I have a flower without that ornament. There is also sometimes a similar mark on the base of the lateral

MASDEVALLIA POLYSTICTA, *Rehb. f.*, VAR. CRASSICAUDA, *n. var.*

This is a curious variety, with much shorter and stouter tails, kindly communicated by Sir Trevor Lawrence. *H. G. Rehb. f.*

GLOXINIAS.

PROBABLY no stove-flowering plants have been improved so much of late years as the *Gloxinia*. The kinds grown some twenty or more years back, and then thought worthy of a name, are scarcely to be found in cultivation now. Named varieties used then to be the order of the day, sowing the seed and producing good flowering plants in 6-inch pots the same season was scarcely thought of, much more worked out in practice. My custom of late years has been to sow a pinch of seed (obtained from a trust-worthy source) early in January. When sown, the pot or pan should be placed in a brisk heat to germinate the seed quickly. When the young plants are large enough to handle easily, they should be pricked off in pans. This should be done before the plants become at all drawn, in order to keep them as dwarf and stocky as possible.

When again in want of a transfer they may be potted singly into 6's, and into larger pots as they may require it; this ought to be done before they become at all pot-bound. By thus doing, the foliage will be better developed, and a finer crop of flowers secured than if allowed to get at all starved in small pots. I find them do well on shelves near the glass when established and growing freely; slight shading is beneficial in hot weather. The moisture maintained here in the stove is rather in excess of their requirements, causing them to make foliage of a too succulent nature. We, therefore, find them do better either in the vineries or Peach-house, especially in the latter. If a pit is at disposal where they can be kept near the glass and slightly plunged, they will do exceedingly well, and soon grow into large plants.

For want of room last summer we placed a lot of seedlings (well established) into a cold frame at the end of May. The seed had been sown in January, and by the end of June the earliest were in flower; from that time onwards till the end of September a never-failing supply of cut blooms was maintained. These were chiefly used on the dinner-table in specimen glasses. The later ones were about that time placed in a stove temperature, where they gave a good supply during October. Some of the best specimens were arranged in groups of plants at various shows during July. The flowers of those in the cold frame were always of good substance, lasting well in a cut state.

When out of flower we keep them in the late vinery, and gradually withhold water. Here they are safe, while the late Grapes are hanging till the first week in January, a slight heat being always kept in the pipes. When this house is thrown open the *Gloxinias* get moved to somewhat warmer quarters. The bulbs of two and three years' growth are selected for the first potting for the earliest bloom, the rest are potted as time can be spared, and brought on at intervals. When in full flower they are used in quantity for conservatory decoration, lasting a long time in perfection. This I attribute to growing them under the treatment previously described. Single plants look exceedingly well on the dinner-table or in the drawing-room, where they are always appreciated. The erect flowered section are (all points considered) the most useful. The semi-erect kinds are also good and very distinct, looking well in specimen glasses. The maculated or spotted kinds (chiefly erect) are very beautiful, and have been greatly improved upon the last few years. These latter ones have one decided point in their favour—they travel far better than the others when on the plant, though perhaps more quickly sensible to the want of water than those of greater substance when they are cut from the same.

They all thrive well in a soil composed of good fibrous peat two parts, turfy loam one part, and silver sand with a little bone-meal one part. Give good drainage, on which a few half-inch bones may be sprinkled in the absence of the bone-meal. Pot firmly and water freely when again established. Any bulbs that may be somewhat shrivelled should be soaked while in tepid water before repotting. Watch closely for any signs of yellow thrips; where any of this pest is seen, remove the plants that are infested, and take means to check it either by syringing or fumigation. Liquid manure may be given twice a week with advantage when the plants are showing for bloom. *James Hudson, Gunnersbury House.*

FIG. 29.—NEPHTHES INTERMEDIA: PITCHERS GREEN, WITH DA'K RED SPOTS. (SEE P. 178.)

introduced by Mr. F. Sander, of St. Alban's, along with *Masdevallia Shuttleworthii*. Hence it must be *Neo-*

**Masdevallia ludieunda*, *n. sp.*—Affinis *Masdevallie Estradæ* perigonio externo patulo; sepalis prope ad basin fissis; laciniis oblongis longe caudatis; caudis quater lacinas superantibus; tepalis pandurato ligulatis apice obtusangulis; lacinula supra basin inflexa; labello pandurato apice reflexo; carinulis obscurissimis quinis, lateralibus minutissimis; columna basi utrinque umbonata. Flos pallide flavescens caudis multo obscurioribus. Sepala intus in parte superiori purpurea; nunc tamen lateralia non ita picta; sed ima basi tantum. Tepala pallide

sepals. The small ochre petals are oblongo pentagonous, with an inflexed angle over the anterior base. The lip is pandurate, lightest ochre-coloured, with a reflexed apex, the centre of which is mauve-purple, and adjacent is a mass of small spots. It is a sweet thing. *H. G. Rehb. f.*

ochracea. Labello ejusdem coloris; apice inflexo purpureo; punctis minutis ejusdem coloris circumstantibus. Columna alba macula utrinque juxta foream maculisque minutis utrinque in bucca basos. *H. G. Rehb. f.*

THE TONGA PLANT.

(EPIPHEMUM MIRABILE, SCHOTT.)

"TONGA, the specific for neuralgia." Such is an advertisement of Messrs. Allen & Hanbury's that has now been before the public for many months past. Tonga is a vegetable drug, and the material from which it is prepared is stated to consist of a mixture of bark and fibrous matter, the botanical origin of which was for some time unknown. A few months back, however, an interesting account of the plants producing this drug was published in these columns (see *Gard. Chron.*, xvi., p. 110), where it is stated, upon the authority of Baron von Mueller, that Tonga is a product of *Premna taitensis* (Verbenaceae) and *Rhaphidophora vitensis* (Araceae). This account was communicated by Mrs. Clendinning, and with it she also sent specimens of the Tonga plants, which were presented by the Editor of the *Gardeners' Chronicle* to the Kew Museum. In the *Report of the Royal Gardens, Kew*, for 1880, published towards the end of last year, it is stated that Mr. E. M. Holmes, curator of the Museum of the Pharmaceutical Society, also arrived at the conclusion that *Rhaphidophora vitensis* was probably one of the plants from which Tonga is in part derived, and that Mr. C. W. Hansen, whilst in Fiji, was enabled to confirm this determination as correct, and to add that he (Mr. Hansen) believed the other plant that enters into the composition of Tonga to be *Premna taitensis*.

We have thus evidence from two independent sources, that the drug Tonga is a product partly derived from *Premna taitensis* and partly from *Rhaphidophora vitensis*; and now that we know this, it is interesting to find that one of these plants, and that most probably the one to which the reputed medicinal virtues of Tonga are due, has been in cultivation in this country during the past four or five years. For upon seeing the specimens of the Tonga plants sent by Mrs. Clendinning, I immediately recognised the Aroid as being identical with a plant cultivated by Mr. W. Bull, of Chelsea, of which I had dried specimens for the Kew Herbarium.

As this plant is involved in great confusion botanically, I think it better that I should here give some details concerning it, reserving fuller particulars, unsuitable for these columns, for another opportunity.

Mr. Bull's plant was introduced from the Fiji Islands by way of the Botanic Garden at Sydney, New South Wales, and it has behaved exactly as described in Mrs. Clendinning's note (though I may here observe that this mode of gradual development and change of form in the leaf, as described below, is by no means rare in the groups of Aroids to which it belongs). When first received the stem was very slender, about $\frac{1}{2}$ inch thick, and the leaves were very small and quite entire, but upon being allowed to creep up a wall or some other support the stem rapidly thickened upwards until it became about 1 inch in diameter and produced leaves, which with the gradual thickening of the stem by degrees passed from their small entire state to a larger and more and more divided form, until finally they became pinnatisect, and including the petiole were from 2 to 3 feet in length. In June, 1878, the plant flowered and a specimen of it was brought to me to name. I did not dissect it with any special care at the time, but a rough dissection showed that there were but about two basal ovules in each ovary, and therefore it would be either a species of *Epipheum* or of *Monstera*, most probably of the former; there was however no specimen in either genus in the Kew Herbarium that would match with it, and it was not compared with the genus *Rhaphidophora*, since that genus as at present understood has a more or less completely two-celled ovary with numerous ovules in each cell. Had I compared it with that genus I should doubtless have discovered its identity with *Rhaphidophora vitensis*, Schott, a typical specimen of which is in the Kew Herbarium, and with *R. pinnata*, Schott, which is the same plant. Though Engler in his monograph of the order (*DC. Monog. Phanerog.*, ii., p. 244) places *R. pinnata* as a synonym of *R. pertusa*, Schott, with which, of course, it has nothing whatever to do, whilst *R. vitensis* is made a variety of the same species. At the time it was thought that Mr. Bull's plant might be *Monstera dilacerata*, Koch, with which the leaves of a young state of growth agree well, even to the small pellucid dots and perforations scattered along the region of the midrib; but, according to Koch's description of that species in the

Wöchenschrift, xiii., p. 33, it cannot be the same plant.

The Tonga plant itself is an ornamental climber of rapid growth, with bold dark green pinnatisect leaves in the adult stage, and large inflorescences, resembling those of a *Monstera* or *Rhaphidophora*. It is a very suitable plant for training up pillars, trunks of Palms, Tree Ferns, &c., or the back wall of a stove; and besides its ornamental character it is specially interesting for the manner in which the plant changes in appearance as it develops from its juvenile state with small entire leaves, to its adult flowering state with large pinnatisect leaves; as well as for its medicinal qualities, which appear to have long been known to the natives of the countries the plant inhabits, since Rumphius in his *Flora Ambonensis*, vol. v., p. 459 (where at t. 183, f. 2, a very good figure of the plant is given), states that the natives of Java and Baly cook "the horns" (terminal buds of flowering stems) a little over a fire, bruise them and squeeze out the juice, which is given to lean and feeble horses and cows, and it is said to cure them and bring them into a fat and healthy condition. The internal substance is pounded and used in the form of a poultice as a remedy for sprains. It is also used as a dentifrice to whiten the teeth, the heart or internal substance being chewed with Pinanga and chalk. Cows feed upon the leaves, especially during the hot months when the fields are destitute of grass; they seem to be very fond of them, and also of the stems, as they are not acrid. Altogether the Tonga plant appears to be a rather useful one, all the more so considering the order to which it belongs, whose members are more noted for their doubtful and poisonous qualities than for their good and useful ones.

The following is a description of the Tonga plant, chiefly compiled from Mr. Bull's specimen, omitting here the full synonymy:—

EPIPHEMUM MIRABILE, Schott, *Genera Aroidorum*, p. 79.—Stem climbing, in juvenile plants slender, about $\frac{1}{2}$ inch thick, in adult flowering plants about 1 inch thick, clothed towards the apex with the persistent fibrous remains of the scale-leaves.* Smallest leaves of juvenile plants, with a petiole $1\frac{1}{2}$ — $1\frac{1}{2}$ inch long, vaginate for about half its length, and a lamina $1\frac{1}{2}$ — $1\frac{1}{2}$ inch long, $\frac{1}{2}$ — 1 inch broad, obliquely cordate-ovate, acute or shortly cuspidate, entire, without perforations; as the plant gets older the petioles elongate and the lamina increases in size, becoming obliquely oblong-ovate, or lanceolate-oblong, acute or shortly acuminate, with small perforations or pellucid spots, mostly arranged along the sides of the midrib: from being quite entire these gradually pass to a more and more pinnatifidly segmented form, until the adult stage is reached. Petioles of adult leaves stout, 8—15 inches long, including the $1\frac{1}{2}$ — $1\frac{1}{2}$ inch long geniculum, convex on the back, channelled down the face, and vaginate nearly up to the geniculum. Lamina $14\frac{1}{2}$ — 20 inches long, $7\frac{1}{2}$ — 12 inches broad, shining dark green, oblong or elliptic-oblong in outline, acute, cordate or subcordate at the base, more or less oblique, pinnatisect nearly to the midrib, and having numerous small perforations and pellucid spots scattered along the region of the midrib, but not confined to that part; segments varying from 4—10 in number on each side, but more numerous on one side than on the other, straight or somewhat falcate, all except the lowest of about, equal breadth throughout their length (usually $1\frac{1}{2}$ — 2 inches broad), apex truncate or somewhat convexly truncate, the upper edge produced into an acuminate point; the terminal lobe more or less diamond-shaped, much larger than the rest. Primary lateral nerves 2—3 in each of the basal segments, one only up to the centre of the other segments, or sometimes two or more, when two or more segments are united into one, spreading, running out straight almost to the margin, and then curved into the acuminate point; midrib and nerves rather impressed above, very prominent and rounded beneath. Peduncle 4—9 inches long, terete. Spathe $4\frac{1}{2}$ — $4\frac{1}{2}$ inches long, ovate, boat-shaped, shortly cuspidate-acute, green outside, puce-coloured inside. Spadix sessile, much shorter than the spathe, cylindrical obtuse, green, about two-thirds of an inch thick. Ovaries cuneate, sub-hexagonal, truncate, one-celled,

* If I understand the descriptions aright of the various authors who have described this plant I think they mean to imply that these persistent fibres are the remains of the veins of the foliage-leaves; but this is not the case, for they are the remains of cataphyllary leaves, which are not developed until the plant flowers, and accompany a change from a monopodial to a sympodial mode of growth of the stem, exactly as occurs in *Philodendron*, for example P. Simsii.

with a septiform placenta projecting one-third across the cell, bearing two ovules, one on either side at its base (rarely only one ovule); stigma sessile, linear.—Schott, *Prodrum Aroidarum*, p. 358; Engler, in *DC. Monog. Phanerog.*, ii., p. 249; &c.

Widely distributed, inhabiting Java, Sumatra, Baly, Amboina, Timor, Fiji Islands, Tropical Australia, and in the Kew Herbarium is a specimen of what I take to be the same species from Whampoa, China (Hance, No. 15,600). *N. E. Brown, Herbarium, Kew.*

THE FLORA OF CENTRAL ASIA.

[So many plants are now reaching us from Central Asia, through the zealous endeavours of Russian naturalists, that the following account of the geography and flora of the region, taken from Dr. Kegel's paper in the recently issued part of the *Ata horticulturalis Petropolitani*, may be valuable for reference, particularly as so little is known in this country as to the geography of the district. The German original is accompanied by a valuable map of the region. Ed.]

The flora of Central Asia contains, besides numerous indigenous species, a large number of naturalised forms. I say "naturalised" species, because it appears that of the original native species of Central Asia only very few have spread to the north and west of Asia and Europe, from whence the naturalised forms probably came. The salt steppes and sandy wastes of the lowlands lead us to infer that even at the beginning of the present epoch, also during the diluvial period, Central Asia was a great inland sea, out of which the mountains protruded as islands, until the bulk of the waters found their discharge through the basin of the Ob, and partly also through that of the Amur—broke through the mountain ranges, and left behind the salt and sandy wastes, which still produce a tolerably abundant flora of salt marsh plants, and which at the present time furnish important obstacles to plant immigration.

A striking example of this is seen in the fact that no species of *Rhododendron* or *Lilium* is found in Central Asia, while in Caucasus, Altai, Baikal, Dauria, on the north slope of the Tibetan Alps, and especially in the Himalayas, many species of both genera are found. On the other hand, Central Asia is the headquarters of various species of *Tulipa*, *Allium*, *Eremurus*, *Elymus*, &c., and also of the *Salsole*. In considering the distribution of plants in Central Asia, with the exception of those of the steppes, we may specify two large, and as far as the flora is concerned, very distinct districts—West and East Turkestan. In West Turkestan I include the district from Fort Turkestan, in the north (44° $20'$ N. lat., 65° $40'$ E. long.) beyond Tschimkent as far as Taschkent (41° $29'$ N. lat., 69° $21'$ E. long.), and including the Aral and Caspian steppes to North Karatau and the west slopes of the west or Taschkent Altatau range. Then further south as far as Chodscent (40° $17'$ N. lat., 69° $25'$ E. long.), and the south-west slopes of Altatau or the mountains of the boundary river, to the Mogol-tau and to the eastward-lying mountains of Sir Daria, and the mountains of Kokan and the district of Lower Naryn. Then further in a south-west direction from Taschkent to Dschisak, with the South-west Karatau to Khiva and Turkomania; finally, as far as Samarkand (39° $56'$ N., 66° $50'$ E.), and the Sarawchan valley to the source of that river and to the high mountains south from Kokan and Margalan to the Alai plateau and Bokhara (39° $47'$ N. lat., 64° $25'$ E. long.).

Notwithstanding the great variety of the plant forms of this locality, amongst which the plants of the valleys represent a mild climate, and mountain plants an alpine and high-alpine flora, these two districts agree in this—that their flora partly resembles that of Caucasus and East Persia, partly that of Afghanistan and the Himalayas, and only on the north frontier is it similar to that of South Russia as far as the immigration of the plants is not checked by the sterile wastes. West Turkestan, however, produces other series of plant forms than East Turkestan (considered according to my definition of the district and not according to that fixed by ordinary geographers who take Nuldscha as the most westerly point of East Turkestan) (about 43° $58'$ N. lat., and 81° $11'$ E. long.). The mountains of West Altatau, or the Alexander chain, extending south as far as Upper Naryn from

Lake Issyk-kul (between 42° 12' and 42° 20' N. lat., and 76° 15' and 78° 12' E. long.), and in a westerly direction from Wernoje (43° 29' N. lat., 76° 59' E. long.), intercept the passage of the flora to the districts of East Turkestan, as I define it; these comprise the mountain ranges round Lake Issyk-kul (Alatau transiliensis, Kungeri-Alatau, Terskei-Alatau); then in the south-east the Thian-Shan Mountains with a very uniform flora, the Termidik or Akburtasch Mountains between the Tekes and Ili rivers, then the Ilihal and the mountains lying to the north of the Tli which surround Lake Sairam (80° 59' E. long., 44° 31' N. lat.), and extend further north under the name of Dschungarischen Alatau. The north-west boundary of East Turkestan is Siebenstromland, between the upper course of the Ili River and Lake Balkasch; the northern boundary is the Tarbagatai range; in the north-east are the deserts and plains lying round Lakes Ebinor, Alakul, Ulungus and Saissanor, which form a boundary, and the flora of which is exactly corresponding to that of Mongolia. Lake Ebinor is, indeed, within the Mongolian territory, and the eastern boundary from Kuldsha is formed by the Irenchaburg chain, which unites East Turkestan on the east with the alps of Kasch and Kunges, and in the plateau of Juldus with the eastern slopes of Thianschan. The flora of this district of East Turkestan includes on one side that of the mountains of South Siberia (Altai, Baical district), partly that of Western Mongolia; yet an important number of the plants of South Siberia pass over only as far as the northern frontier mountains of the Dschungari range, few reach to the Sairam Mountains, and fewer still to Thianschan, where, in place of which, similar indigenous species are found. The immigration of the plants of the south-west goes through Caucasus and Persia to the mountains of West Turkestan, but the majority of the plants of Central Europe have emigrated over South Russia along the South Ural, and through South Siberia to East Turkestan without reaching West Turkestan by passing over the sterile Aral steppes. Purely northern species of the arctic zone are very rarely found in the alps of Turkestan, and while the mountains of South Siberia contain or turn back many more northerly species, very few of the high alpine plants of Central Asia are found until the arctic zone is reached. The great Central Asiatic inland sea appears formerly to have hindered this migration of the flora, while the arid deserts of the present day serve the same purpose. On the other hand, many universally distributed plants, whose seeds have been dispersed by wind, water, birds, &c., over wide areas, flourish in Central Asia; and many of the commonest European weeds which spring up amongst rubbish and by roadsides have possibly been carried originally from Central Asia to Europe through the medium of caravans. Thus in particular we find in the mountains of Turkestan, growing on passes at an elevation of 8000 feet, amongst alpine plants, *Chenopodium album*, and the shores of Lake Issyk-kul produce a marsh flora differing in very few respects from the marsh flora of Central Europe.

GROWTH OF THE LEAVES OF VICTORIA REGIA.

THE Berlin *Monatsschrift* for November contains the record of a series of observations, by Dr. O. Drude, on the growth of the leaves of the Victoria Regia, a plant that has been the subject of much investigation. In consequence of the rapidity of the growth of its leaves Dr. Drude chose this plant for investigating the phenomena of intermittent variations of growth. "By intermittent or jerking variations of growth" (*die stossweise Veränderungen des Wachstums* of Sachs) we would designate the interrupted effect of growth in length commonly exhibited by an internode, stem, or leaf in short intervals. This branch of biology has hitherto not been the subject of much study, owing partly, no doubt, to the difficulty of obtaining trustworthy results. To measure the growth of slow-growing organs at intervals of one minute it is necessary to employ an instrument (auxanometer), the movement of the arms of which is enormously magnified; but Dr. Drude was able to obtain measurements of the leaves of Victoria Regia by magnifying the actual growth only eight times. And Dr. Drude believes, assuming that the same physiological principles hold good for plants of slow and fast growth, that he has obtained more trustworthy data for generalising than pre-

vious investigators. Two auxanometers of Sachs' *Zeiger am Bogen* type (see Sachs' *Lehrbuch*, edition 4, p. 799, fig. 480—arc-indicator of the English edition) were employed. These were connected with the leaf by means of thin platinum wire running over freely moving rollers—the one indicating the longitudinal growth of the whole petiole, and the other that of the whole leaf. The difference between the reading of the two gave the growth of half of the blade, as the petiole is nearly central. We have not space for the full particulars of the manner in which the instruments were tried and the experiments conducted, but the following explanation will render the results intelligible. Readings were taken every five minutes, uninterrupted during a period of thirty-six hours, commencing August 4, at 4 P.M., and concluding August 6, at 4 A.M. The temperature of the water and air was recorded simultaneously, or rather immediately after each reading. During the course of the experiment the leaf attained its maximum rate of elongation, and grew slower towards the end. The auxanometer was graduated in millimetres (a millimetre is about $\frac{1}{25}$ of an inch); and the total elongation of the petiole during the experiment, as deduced from the division of the indications of the auxanometer by eight, was 281.8 millimetres; of the lamina, from the centre or apex of the petiole to the notch at the morphological apex, 284.8, or nearly the same. The hourly means were respectively 7.8 and 7.0 mm., from which the considerable elongations of the five minute readings may be inferred. The following are the readings for two hours on August 5:—

Time.	Growth of lamina in degrees of auxanometer (each $\frac{1}{8}$ mm. of actual growth).	Time.	Growth of lamina in degrees of auxanometer (each $\frac{1}{8}$ mm. of actual growth).
MID-DAY, 12h. 0 m.	7.6 mm.	1. 1. 1 h. 0 m.	8.0 mm.
5	7.5	5	7.3
10	5.9	10	7.7
15	7.0	15	8.1
20	7.1	20	7.0
25	7.1	25	7.5
30	11.1	30	4.6
35	8.7	35	12.6
40	7.7	40	10.7
45	9.0	45	8.8
50	14.5	50	6.7
55	10.7	55	6.0

The actual elongation for the first hour was about 13.8 mm.; for the second, 12.3. The following are the readings for 1 hour and 40 minutes during the night of August 6:—

Time.	Growth of lamina in degrees of auxanometer.	Growth of petiole in degrees of auxanometer.
A.M. 1 h. 45 m.	6.0 mm.	6.0 mm.
50	6.0	3.5
55	6.0	3.5
2 h. 0	7.3	3.4
5	8.4	2.3
10	10.0	4.0
15	15.0	2.2
20	10.2	2.8
25	10.0	4.4
30	14.2	5.9
35	12.0	4.2
40	9.8	3.0
45	7.2	3.5
50	6.5	4.5
55	6.4	2.6
3 h. 0	4.3	4.4
5	6.0	6.0
10	4.5	5.0
15	4.7	4.4
20	4.5	2.7
25	4.5	4.2

The foregoing example shows the greatest bound in growth observed during the experiment. One of the results of this experiment is that the fluctuations from five minutes to five minutes is greater than that previously observed from hour to hour.

HELLEBORES.

AMONG hardy plants few are more showy and useful than the Hellebores, blooming as they do at a time of year when flowers are very scarce, especially in the open, and were it not for these Christmas Roses we should have to search borders in vain for a blossom, but with a clump or two of them in a sheltered sunny position the weather must be bad indeed during the depth of winter if there are not some flowers to cut, for in spite of snow or frost they continue to push up and expand. This season they have been remarkably fine, for not only have the blooms

been abundant, but they have been almost equal in purity to the Eucharis, and were the Hellebores stove subjects they would no doubt be as much cultivated and as highly thought of as that well known favourite, but being hardy and easily cultivated they are not often met with in gardens. This want of appreciation for such useful subjects is to be regretted, as with a little of the means and labour that is now devoted to others, greenhouses and rooms might often be kept gay at a comparatively trifling cost.

Not only is the Christmas Rose very fine in borders, but it forms an excellent pot plant, and is well adapted for the embellishment of windows, where, if kept with plenty of water, it flourishes and looks quite at home. The flowers, too, are of great value for cutting, as they dress well and last long in water. The way, I think, they look best is in low bowls or vessels of that kind, filled with fresh green wood-moss, and associated with a few red Camellias or spikes of *Schizostylis*, as the bright colours of these contrast well with the white, and set off the Hellebores to the greatest advantage. They also blend well with Violets, and a good way of using these with them is to have the plants, if small, and by placing a few leaves of the Hellebores around the sides of the bowl or dish a very natural group may be formed.

If Christmas Roses are required for cutting, the best way is to have them on a border under the shelter of a wall, where if the flowers are desired early they can be protected by placing a frame or some old lights over them, which will not only help to forward them considerably, but cause the blossoms to come much more refined and pure in colour. Without shelter or protection of some kind the outer petals are often stained, and the flowers being low down, get splashed with dirt, but with a covering they escape this disfigurement, which stains and spoils much of their beauty. Isolated clumps in borders can always have a bell or handglass over them, but however covered it is essential that they have some air left on to keep them from damping. As Hellebores are fond of good soil, the bed or border in which they are to be grown should be properly prepared by working into it, at a good depth, a dressing of leaf-soil and a little thoroughly rotten manure. These will not only enrich the ground, but keep it open and porous—a matter of great importance with Christmas Roses, as they have very large fleshy roots that cannot ramify freely unless conditions are favourable.

Where they do best without much preparation is on the margins of Rhododendron beds in peat, which they like much, and which need only be just broken up at the time of planting to give them a start. The situation also suits them, as during the summer they are fond of a little shade and make all the more growth under its influence. This being so it is always advisable to have those required for lifting to put up for furnishing greenhouses, or for the embellishment of windows, planted where they can be so favoured, as the quantity of blossoms they yield depends almost entirely on the amount of foliage they make, for without plenty of healthy fine leaves, strong plump crowns are quite out of the question. To help them in their growth during spring and summer they should, when the weather is dry, have a good soaking of water or liquid manure, and it is a good plan to mulch over the bed or border they are in, as the mulching keeps the soil cool, and maintains a more uniform condition of moisture.

To have them a little established in pots before they bloom they should be lifted early, that is, by the end of October, and be potted in light rich soil and well watered to settle the same about the roots, and then stood in frames and kept a little close to bring them gradually on. Many think Christmas Roses slow and difficult to increase, but if taken at the right time they are not so, as they may be divided readily, and every piece with a crown and a few roots will grow. To effect a division and make the most of the old plants the best way is to dig them up and shake or wash every particle of soil away, so as to see clearly where a separation may be made, when they may easily be pulled apart without risk or injury to the hearts. The proper season to do this kind of work and replant is between this and April, as by making the severance just as they begin to start the wounded parts quickly heal over without suffering injury from rot. The most desirable kinds of Hellebores to cultivate are *H. niger*, and its larger variety, *H. niger maximus*, which has finer leaves and much larger flowers, and is the best for cutting from, as the blooms are very bold looking and have longer stems. *J. S.*

Orchid Notes and Cleanings.

WORK IN THE HOUSES.—As we may soon expect bright sunny days, accompanied with chilly winds, more than ordinary care will be required in admitting air during the next two or three months to prevent cold draughts from passing through the houses, as no class of plants are more quickly affected for good or evil by ventilation than Orchids. During the cold season it is always advisable to tack a piece of thin canvas or perforated zinc under the ventilators; this effectually prevents a large volume of cold air from going direct on to the plants, and also tends to conserve the moisture in the house, which is a great consideration when free ventilation can safely be indulged in. Many have recommended that Orchid-houses should be almost hermetically sealed during the winter season. Our practice is to have a constant change of air taking place—little or much, according to the state of the weather, and our East Indian house is generally open night and day 2 or 3 inches the whole length of the house, but this free ventilation could not safely be indulged in if we had no canvas under the ventilators, as stated above. Another practice we object to so early in the season is suddenly closing the houses during sunny weather, and at the same time damping them down. This sudden excitement should be avoided for the present, as it cannot be maintained till a later period of the season, and any sudden fluctuations of temperature at the present time will only render the plants less able to stand against a spell of cold sunless weather, which may yet be in store for us. We are now busy putting the Mexican-house in order, clearing out all old material from under the stages of the house and putting in clean fresh fibre. We are not troubled with many insect pests in this house—a few white-scale on some of the Cattleyas; these if carefully cleaned at the present time will keep free for some time to come. Every plant in the house will be sponged over, to clear the pores of the leaves and stems, and thus put them in the best condition for taking advantage of the genial atmosphere that should surround them. In re-arranging the plants all that are in growth, such as *Lælia purpurata* and *Cattleya crispa*, should have light positions assigned them in a warm part of the house; while *Cattleya Skinneri*, now at rest, should be placed in the coolest and driest corner. The earliest Pleiones that have been treated to a little extra warmth to start them will now be better arranged with the Cattleyas, and when the season gets warmer the cool-house will suit them best. *Dendrobium cambridgeanum* and *D. chrysanthum* that have made growth quite rapidly enough in this house up to now will be moved into warmer quarters. *Oncidium Forbesi* and *Odontoglossum hastifolium* are right for potting; other plants in this house will be top-dressed, and dealt with freely or otherwise according to the state of the material about their roots. The blinds should now be got up on all the houses, not so much to check the sun as to keep down excessive temperatures. *J. Roberts, Guimershury.*

A NEW WHITE PHALÆNOPSIS.—Messrs. Hugh Low & Co. had in flower at Clapton, early in the week, a very fine novelty, in the shape of a clear white form of *Phalæopsis Schilleriana*, and which is believed to be the first that has been seen. The sepals, petals, and labellum are pure white, the crest of the lip yellow, and the side lobes white, with yellow spots on the upper portion. It is a very pretty introduction, and has been sent to the learned orchidic Professor, from whom we shall no doubt soon hear more.

LYCASTE SKINNERI, VAR. DELICATISSIMA.—From Mr. Lee, Leatherhead, comes a flower of the lovely *Lycaste Skinneri* var. *delicatissima*, more than 5 inches across, the outer segments nearly 1½ inch at their widest, of firm substance, white, suffused with a delicate pink; the petals, lip, and column pure white. There is, as in very many other Orchids, a central tongue-shaped projection from the lip, which, from its position opposite the column, may be the third stamen of the inner row of those organs, as Robert Brown thought, or it may be a mere outgrowth from the lip. Study of the mode of growth of

the flower from its earliest stages could alone decide that point.

ODONTOGLOSSUM CRISPUM VAR. SULPHUREUM. This is a variety of *Alexandra*, with medium-sized flowers of a pale sulphur-yellow, almost entirely unspotted, the lip clear canary-yellow, especially at the base; the crest on the lip may represent a barren and branched stamen, just as the crested wings to the column almost certainly do.

ODONTOGLOSSUM CRISPUM FASTOSUM.—This variety is not inaptly named *superb* (*fastosum*). A flower before us from Mr. Lee's collection is some 3 inches across, the three outer segments lanceolate, with revolute margins, white, with a broad central stripe of rich lilac, and with a few large circular brownish-lilac spots; the petals resemble the outer segments in form, but are more crisped and waved at the margins, and pure white, with the exception of one or two brownish-lilac spots. The lip is white, with a few large brownish spots in the centre, and an irregular row of smaller ones parallel to the margins, near the base. The crest is yellow, with brownish-red stripes.

ODONTOGLOSSUM ANDERSONIANUM VAR. LOBATUM.—Flowers 2½ inches across, outer segments linear-lanceolate, whitish, with numerous chestnut-brown bars and blotches; the petals are somewhat broader, with smaller blotches; the lip is deltoid, lanceolate, prolonged into a long point (acuminate), white, with a central brown bar, yellow at the base; the crest is also yellow, with a few brownish stripes.

ODONTOGLOSSUM WILCKEANUM.—Flowers 3 inches across, three outer segments broadly lance-shaped, wavy at the margins, pale yellow, with large transverse bars and blotches of light brown, petals similar to the outer segments, but broader and with smaller blotches; lip more than half the length of the petals, broad at the base, expanding near the free end in a roundish way extremely, very pale yellow blotched with brown, and with a fierce hedgehog-like crest. From Mr. Lee.

ODONTOGLOSSUM PESCATOREI MACULATUM.—Flowers 2½ inches across, sepals and petals lanceolate, white, with a faint blush of lilac, lip oblong at the base, with two lateral short erect oblong entire lobes, the central portion expanding into a broad horizontal two-lobed limb, with a short point between the lobes. The lip is white, with lilac spots; the crest of the lip yellow, with lilac stripes. It is curious to see how closely the side lobes of the lip, which, by the way, are much more marked than they are in the nearly allied *crispum*, and the side lobes of the column correspond in form.

PHALÆNOPSIS STUARTIANA VAR. PUNCTATISSIMA.—A queenly flower from Mr. Lee's collection. The three outer segments are oblong elliptic, the upper one pure white, the two side ones white where overlapped by the petals, but where not so greenish, thickly dotted with carmine-red spots. The lip has a narrow white stalk, the blade of the lip being divided into three distinct lobes, two lateral erect or ascending obovate, yellow at the base, elsewhere white and spotted; between the two side lobes is a thick yellow crest or callus, looking like an air-cushion with a division down the centre, the centre lobe of the lip is rounded at the base, narrowing a little toward the end, the extreme part of which branches into two very narrow pointed segments, like the fluke of an anchor.

SOME RARE ORCHIDS AT MR. BULL'S.—There are two things which the immense quantities of Orchids that of late years have been introduced have established—the almost unlimited extent to which they vary in a state of Nature, and also the extent to which the hitherto so-called species (if such they in all cases really are) intercross naturally. This is especially observable in the *Odontoglossums*. Of late many have made their appearance which so clearly exhibit characteristics in colour and form—the latter most reliable—of having originated from distinct species, as to leave little doubt of their being natural hybrids. Of some of these, although pretty and highly interesting, it must be confessed that, from the cultivator's point of view, they are no advance upon the kinds from which they spring. In exception of this Mr. Bull has lately bloomed several splendid sorts that, in addition to being wholly distinct from

anything previously seen, are most beautiful. One, which has the appearance of being the offspring of *O. crispum* and *O. hystrix*, forms a fine spike—a small plant having nine flowers on a single raceme; the flowers are large, and arranged in close and regular order; the ground-colour is ivory-white; three-fourths of the inner surface of the lanceolate sepals is covered with an unbroken blotch of reddish-crimson; the ovate lanceolate petals heavily spotted with the same colour, with a large yellow blotch on the base of the labellum, which also is ovate lanceolate, and tapering to a long point—a grand flower. Another, equally distinct, has very large, massive flowers disposed at greater intervals on the spike; the length and breadth of the petals and sepals are unusual; the ground-colour is deep, clear primrose-yellow, spotted and barred with reddish-crimson. In the case of both the above plants the bulbs and leaves are very distinct in appearance; the leaves especially are large and thick, with much more substance in them than this section of *Odontoglossum* generally presents. To these may be added a form of *O. illustre*, more distinct than many species are; in this the sepals and petals are unusually broad and massive, so much so as to give it the appearance of an exaggerated *O. Andersonianum*; both sepals and petals are heavily marked for three-fourths their length with deep red, the lower portion spotted with bright crimson; the ground of the entire flower is pale straw colour. A very large number of *O. cirrosum* are in bloom, several of them being remarkable for the size of the flowers, with the purity of the white ground colour, and the intensity of the bright red spotting. Amongst other *Odontoglossum* bearing hundreds of spikes in different stages of development the following were blooming in quantity:—*O. Hallii*, *O. Andersonianum*, *O. Pescatorei*, *O. pulchellum majus*, *O. tripudians*, *O. Kossii majus*, *O. gloriosum superbum*, *O. triumphans*, *O. nebulosum*, *O. emines*, *O. maculatum erosum*, and *O. cordatum*. Of *O. crispum* there are endless varieties, from those with heavily spotted flowers to others that are pure white, or white suffused with pink; in one example the whole of the flowers composing the spike are pure white, except the right hand lower petal of each bloom, which is deeply tinged with pink, giving it a singular appearance. In another form the flowers are almost circular, pure white, with the base of the lip pure yellow—a lovely variety. Of *Lycaste Skinneri* many fine varieties, one with sepals and lip pure white, whilst the whole of the surface of the petals is deep unbroken crimson. The beautiful *Dendrobium crasinode Barberianum* was in fine condition, the intense deep purple marking on the points of the sepals and petals on the purest of white grounds gives the flower a most chaste appearance. Near it were several examples of the rare *Coleogyne cristata alba*, a lovely flower without a tinge of colour on the pure white. *Oncidium cucullatum purpurascens*.—Of this there is an unusually beautiful variety; the whole of the surface of the sepals and petals is deep reddish-brown, whilst four-fifths of the labellum is covered with the darkest purple spots. *Lælia albidia gemma* has flowers possessing more than double the size and substance of the ordinary type; sepals and petals for three-fourths their lengths from the extremity deeply suffused with deep pink—a distinct and handsome flower, much superior to the ordinary variety.

ODONTOGLOSSUM CRISPUM.—It has been stated that the varieties of this fine cool Orchid, recently introduced, are not so good as those sent into the country ten or a dozen years ago; and the belief is held by those who have had a good opportunity of judging. It may be that the earliest collectors in the field selected the best varieties; indeed, we have a dozen plants from one of the first of Messrs. Veitch's importations, and they are certainly distinguished for great breadth of the petals and sepals, but I have seen some splendid varieties amongst the recently imported plants, notably in Mr. Bull's collection at Chelsea, and in that of Mr. Bockett at Stamford Hill. Mr. G. F. Wilson, of Weybridge Heath, has also some fine varieties, and the large importations sent into the country during last season have been distinguished at least by the splendid bulbs and the largest masses we have yet seen. *J. D.*

ANGRECEUM FRAGRANS.—I observe mention is made in *On and Off Duty* of *Angreecum fragrans*. This species grown in England at present under this or any other name? *H. E. C., Liverpool.*

CHARLES NAUDIN.

We are privileged to lay before our readers the portrait of a distinguished Frenchman, as well known to horticulturists as to botanists. For several years M. Naudin was connected with the Jardin des Plantes, and was associated with his friend, M. Decaisne, not only in his official duties but also in the publication of various works on botany and botanical horticulture, which have made the names of the two friends familiar to all French and very

to physiologists and cultivators. For several years M. Naudin cultivated and made experiments on some 1200 Cucurbitaceous plants belonging to various species and varieties, which by his observations and experiments he was enabled to range under three species, each presenting very numerous and often analogous variations. The description and classification of the endless series of Gourds, Cucumbers, and Melons, are extremely remarkable, and valuable for cultural purposes were it only for the practical hint obtained, that in the case of such plants as the Melon and

a felicitous choice to select M. Naudin as the superintendent of a garden so rich in rare and interesting plants collected and studied by MM. Thuret and Bornet. The glories of this garden have been chronicled in these pages at various times, and several illustrations have been given from the exquisite photographs of M. Bornet. The garden at Antibes, under its present management, is a sort of *succursale*, or branch establishment to the Jardin des Plantes at Paris, though it must be admitted that the branch establishment is, as far as gardening

CHARLES NAUDIN.

many horticulturists of other nations. As a botanist, M. Naudin is best known by his elaborate monographs on the Melastomaceae and Cucurbitaceae. He has recognised the necessity of cultivating the objects of his study whenever circumstances permitted, and has been an exclusively herbarium botanist only when he could not do otherwise. In this manner he has obtained an insight into the range of variation, the general habit and life-history of plants, impossible to be obtained from the study of dried specimens only, however well prepared. His experiments and researches on hybridisation have been so numerous and thorough that they have been of the greatest service

Cucumber, it is better and more profitable to endeavour to improve existing kinds than to introduce new kinds from other countries.

M. Naudin retired from Paris some years ago to take up his residence at Collioure in the Eastern Pyrenees, and in the propitious climate of that region devoted himself to the collection, cultivation, and study of plants from all climates that will thrive in that region, paying strict attention at the same time to meteorological phenomena and their relation to plant growth. On the death of M. Thuret, and the acquisition, by the French Government, by gift, of the noble garden at Antibes, it was

concerned, far more attractive than the parent. M. Naudin aims at maintaining in the lovely but trying climate of this part of the Mediterranean region a veritable garden of acclimatisation, if the word may be permitted, and gladly receives seeds and plants of tropical or semi-tropical species for experimental culture. At the present time M. Naudin is specially interested in collecting and studying the numerous species of Eucalyptus, not only from the point of view of the botanist, but also from that of the economist. Every facility is given to students of any nationality to pursue physiological, botanical, or horticultural studies.

FRUIT NOTES.

Early Cherries.—"J. S." has omitted three excellent early Cherries from his list—*Belle d'Orleans*, *Early Purple Guigne*, and *Early Lyons*. The first I have had on an E.S.E. brick wall for the last twenty-four years; it is productive and good. The two latter I have only grown in pots in a cold orchard-house. *Early Purple Guigne* was in perfection on June 3 last. I then sent it as the principal table ornament at a large public lunch, and it was admired by all who saw it. The fruit (110) were all consumed at the table, so the quality was well proved. *Early Lyons* is good and fertile; it is perhaps ten days later than *Early Purple Guigne*, which with me is a trifle earlier than *Wesler's Early Black*, to which I can give a most excellent character. *P. Bonole*.

Pears Ripening Prematurely.—A question asked by many this season is, What is the reason of my Pears keeping so badly? What answer can be given? *Winter Nelis*, one of our best Pears, which is generally in use in January and February, went all rotten early in December. *Ne Plus Meuris* were all over by the middle of January, though they usually last out until the end of March. *Bergamotte d'Esperen*, an excellent late Pear, which often keeps well through March, was over by the middle of January. *Sussette de Baye*, a very fine Pear, went like a ball of flour by the end of December. It did not rot as other Pears have done, but became soft and floury; it has often kept with us through March. Many other Pears might be named which have gone the same road. *D. Lumsden, Flore-hain Hall Gardens*.

Apple, Isle of Wight Pippin (syn. Orange Pippin).—This very excellent Apple is one in which, I fear, many of your readers are not acquainted, owing probably to the fact of its being rarely seen or heard anything of anywhere except in the Southern Counties and the island from which it takes its name. Wherever it is grown, and succeeds, it is almost certain to become a great favourite, and for this reason it is not unworthy of being brought before the notice of your readers. It is too small ever to become a popular market variety, but for favour alone it is not too much to say that for a first place it would run a "neck and neck" race with *Ribston* and other well-known kinds—indeed, I know of persons who infinitely prefer it to a *Ribston*. Description:—"3 size, 1 quality; November to January; round; skin yellow, covered with russet, and highly coloured with orange and red next the sun; stalk very short, set in a shallow, round, even cavity; eye set in a slightly sunk-in basin; flesh firm, juicy, with a fine aromatic flavour." On a chalky soil the tree is a strong grower and free bearer. *J. H.*

Late Pears.—In the remarks Mr. Carmichael makes on late Pears, I can fully endorse what he says in favour of *Bergamotte d'Esperen*, which is the very best late kind we have, and one that invariably does well here, but which this season, like most others, is behaving very strangely, as the fruit was not only in long before its time, but has spotted and rotted to a very serious extent. *Josephine de Malines*, too, usually good with us, have all turned mealy, and though we have at least a couple of bushels, fine in size and handsome in appearance, I do not think that I could pick out enough for a dish at all fit for table. *Glou Moreau* went much in the same way, as also did many other sorts, the best among the numerous varieties we have being *Passe Colmar*, which is one of the sweetest, most juicy, and valuable winter Pears in existence. What made these esteemed fruits so bad was the wet, unless autumn, for though they swelled out and looked remarkably clear in the skin, they were very watery, and full of crude juice within. This was only a natural result of the want of solar heat, without which Pears are sure to be deficient in quality. Mr. Carmichael asks if any one has ripened *Beri Mai*, in answer to which inquiry I may say that we had it fairly good two years ago, but it is of that hard, unmelting nature of flesh that I think it will never be worth much for dessert. We have about a bushel of it now lying on the fruit shelves, and shall therefore be able to see how it turns out again when the season becomes more advanced. In appearance the fruit bears a close resemblance to an undersized *Uvedale's St. Germain*, from which it was most likely raised. *J. Sheppard, Wellesbourne*.

The Flower Garden.

WHERE plants for bedding-out are required on an extensive scale much will depend upon spring propagation, and preparation for this purpose should be made at once. As the season has been altogether favourable for the purpose many of the stores of plants or cuttings struck in the autumn are already in a condition to afford cuttings, and if such is not the case they should at once be introduced to an increased temperature, to bring them forward as soon as possible. Amongst these may be specified *Alternanthera*, *Coleus*, and *Fresina*, and similar soft-wooded tender plants. At the same time store pots of autumn-struck cuttings of such things as *Heliotropes*, *Salvias*, *Cuphea*, and *Ageratum*, that are required for mixing with the plants in the herbaceous borders, which, being of a hardier constitution, should be shaken out and potted off at once, either to furnish a further supply of cuttings if required, or to be well pinched back occasionally to make stocky plants later on.

SUBTROPICAL PLANTS.—A first sowing of seeds of the various subtropical and fine-foliaged plants should be made at once, as their season at the best is but a short one, and the earlier they can be brought into established plants the better; they comprise *Kicinus* or *Castor-oil* plant, of which *K. Gibsoni* and *R. sanguinea* are desirable varieties, together with the more robust growing sorts for extensive places, as they all require ample room for development, and must also be amply fed at the roots with very liberal supplies of manure, the richer the better. The great beauty of all these so-called subtropical plants consists in an imposing appearance, and to attain this they must have very liberal treatment at the roots and a clear space above-ground to exhibit their true character; so treated, the *Solanums* in their varieties are very grand and effective; so are *Wigandias* noble plants if liberally treated; so also are *Ferdinanda* eminens and *Eucalyptus globulus*. Among the dwarfier sorts, *Chamepitys diacantha* and *C. Casablanca* may be grown into very effective plants by beginning in time and giving liberal treatment. *Erythrina cristata-galli* is very interesting, but not showy—its chief beauty is its scarlet blossoms, like bunches of coral; with many others, the propagation of which by seeds cannot be commenced too soon now. *Cannas*, too, may be grown from seeds, but as the roots are easily kept through the winter, many will prefer to part them: potting them off singly, and placing them in a heated structure for a time—under the stage will do—until they begin to grow away, when they may be shifted to a greenhouse temperature, and gradually be hardened off.

DAHLIA roots should be looked over, and sorts that are found to be scarce introduced into a genial moist heat for the supply of cuttings; these should be carefully broken off and inserted singly in thumb-pots as soon as they are from 2 to 3 inches long; avoid too close a temperature, or they will be drawn up weak. Seeds of the beautiful and very valuable single sorts should be got in at once; the general crop may be sown in boxes, and potted off as soon as they are ready, but very choice selected seeds would be better sown singly by placing them upright in small pots; these will become well established, and make strong plants. Any superior roots saved from last year may be propagated as above.

HERBACEOUS BORDERS.—Should the mild weather continue the regulation of the plants in the herbaceous borders by reducing the size, weeding out coarse and ineligible sorts, enriching the soil and digging over the borders neatly with a narrow and sharp spade may be commenced at once; large clumps should be greatly reduced in size. As these plants are much liable to injury from slugs, a good dressing of soot before digging will be found very useful. Soot is a good fertiliser as well as inimical to the slugs, but it must not supersede a good dressing of well decomposed manure, as, when borders have to sustain the exhaustive process exercised by a great number of plants, many of them gross feeding, in a limited space, they must be well fed. *J. Cox, Redleaf*.

The Orchard House.

SINCE I wrote the note on p. 51 it has been colder, inclining to frost; and, what has been much worse, thick fogs night and day. And such fogs! If we had been so unfortunate as to have had any trees in flower it would have been safe to predict that in such an atmosphere not a blossom would have set; indeed, in this, being so close to London, lies our difficulty, early in the year. The days of bright sunshine are so few that great pains are required to get a good set, owing not so much to the low temperature as to the dull, cloudy, and often foggy weather. The only way is to keep the glass clean, to ensure a dry atmosphere, and to keep up the temperature by artificial heat, especially by day. The temperature is kept in motion by the hot-water pipes, and prevents the moist, stagnant air settling amongst the blossoms, which always proves fatal to them. If the earliest trees are not yet in blossom, I would advise that they should not be pushed on too fast; rather, as previously advised, maintain the night temperature below than above 55°. Up to the time of the buds opening a moderate degree of moisture in the atmosphere is desirable. Look over the branches, especially the young wood, and if there are any of the aphid tribe on them it is best to fumigate the house with tobacco-smoke. In the late house the trees are still at rest, although the flower-buds are steadily becoming more prominent. The trees were removed into the house from the plunging material out-of-doors about three weeks ago. Artificial heat is not necessary for them at this time, as a little frost could do no harm, but in our case it is necessary to keep up the temperature a few degrees at least above the freezing-point, as we find our heated structure very convenient indeed for wintering *Pelargoniums* and other plants that are not hardy. See p. 51 for other cultural directions. *J. Douglas, Loxford, Hford.*

The Pine Stove.

REPORTING may be done any time this month as occasion permits. It is, however, best not to delay the operation too long, as an early start gives the plants time to make a large sturdy growth. Before potting the soil should have the chill taken off it, and the finer particles sifted out. To each barrowload of good fibrous loam put one 8-inch pottful of half-inch crushed bones and bone-dust in equal parts, with a 6-inch pottful of well prepared charcoal about the size of pigeon's eggs; this keeps the soil open and sweet. The soil should be in a good medium state as regards moisture, and if the shifting has to be done outside, a mild fine day should be chosen. Reporting requires great care and discrimination, so that the plants or roots are not injured, and the work is carried out with method. Have sufficient help at command to ensure the work being got over quickly, to prevent the plants from being chilled by keeping them about too long. Clean pots and perfect drainage are indispensable. When the plants are knocked out of the sucker pots, remove the lower leaves carefully; put the required quantity of rough loam in the bottoms of the fruiting-pots, beat it well down and then place the plant in its proper position, so that the ball is not moved again. Place the plant well down in the pot, and gradually work the fresh material round the old ball; this should be firmly rammed down, but see that the rammer does not injure the roots. By placing the plants well down they take a firm hold of the soil, but if potted shallow the plant becomes loose in the pot—a very undesirable thing, which cannot afterwards be remedied. It is also essential that no loose soil should be allowed to get into the centres of the plants during the potting. When the operation is completed plunge them thickly together for a time; this will economise space, and the plants can be allowed more room afterwards. Keep them in a bottom-heat from 55° to 90°; if plunged in fermenting materials 5° more, but these limits should not be exceeded at the base of the pots. If the rooted suckers have been kept during winter at or near the temperatures I have indicated the above bottom-heat will suit them; but if on the other hand they have little or no bottom-heat, with low temperatures, start them with 10 less for bottom-heat, as too great a change in temperature is apt to make the plants bolt instead of inducing them to start into fresh growth. The sizes of pots for Pines,

Black Jamaicas, and other small varieties should be 11 inches; for Smooth Cayennes, Charlotte Rothschilds, and other large varieties, 12 inches. If the plants are grown in old or dark structures the sizes used may be 1 inch less respectively, viz., 10 and 11 inches, to suit the varied conditions in which they are grown. I have used 13-inch pots here for eleven years for the large varieties; as they require less frequent watering, but at the same time careful watering is a point never neglected. This is, however the largest size I have used, and 16-inch pots have not been used by me, as was stated in mistake by a recent writer in a contemporary on Pine growing here. *D. Wilson, Castle Hill, Devon.*

Grapes and Vineries.

THE earliest house will now be ready for thinning, and in some cases thinned, if the Vines broke freely. When thinning is completed give the border a thorough soaking with tepid manure or guano water at a temperature of 85°. Stop all the laterals at one leaf if there is room for the foliage without crowding, but if not pull them clean out, leaving only sufficient to cover the trellis thinly all over. If there are any surplus bunches take them off at once before they swell much. If any red-spider appears sponge the leaves with clear tepid water. Do not sulphur the pipes while the skin of the young berries is tender, or it will cause them to rust and spoil their appearance. Keep the evaporating pans filled with weak manure-water, and damp paths and borders with tepid water several times daily. Give air early in the day, increasing it as the temperature rises, and close early in the afternoon; still keep the night temperature 65°, with a rise of 10° by day. Attend to fermenting material on the outside border, as advised in last Calendar. Succession Hamburghs started early in January will now be showing bunches, and must have the temperature steadily increased until it reaches 65° by night, with a rise of 10° by day. Examine the border, and if dry water with clear tepid water. As soon as the bunches can be seen disbud them, going over them carefully and leaving the best placed shoots and bunches. Muscats started on January 1 will now be breaking fast, and can be kept at a night temperature of 65°, with a rise of 10° by day. Increase the temperature steadily as growth advances until it reaches 70° when they are in bloom, with a rise of 10° by day; attend to disbudding as soon as the bunches can be seen, and keep a moist healthy growing atmosphere. If a house of Hamburghs was started as advised in my last Calendar, only use sufficient fire-heat to keep the temperature 55° while the weather is mild; a few degrees less, if frosty; keep the rods well syringed to induce them to break regular. If any borders of late houses require top-dressing or remaking, it must be done at once, using material as previously advised, and mulching the border with manure to protect the roots. Keep late houses as cool as possible by having the ventilators open night and day (except in severe frost) to give them all the rest possible before starting. Do not let them get dust-dry at the roots, but give them an occasional watering. I always give the inside borders a good soaking with cold water after the Vines are pruned, and that is generally sufficient until they are started. This is a good time to start houses containing young Vines, as there is time for a good season's growth, and to get the wood well ripened in autumn. Let the leaders go to the top of the house without stopping, but the side shoots must be kept as for older Vines. Do not over-crop if it is the first year, six bunches on each Vine will be sufficient. Pot Vines swelling their fruit must have liberal supplies of manure-water at the roots and a moist healthy growing atmosphere. Late Grapes hanging in the fruit-room keep at a temperature of 45°, filling up the bottles with soft-water as required. While this mild weather lasts very little fire-heat will be required, only a little to dispel the damp. Put in Vine-eyes, either in pots or on turf. If for planting permanent Vineries, I think those put on turves are the best. Make a good hotbed of dung and leaves in a heated pit, where they will be close to the light, and then turn the turves grass-side downwards, and insert the eye in the centre of the turf with a little sand. Keep the temperature about 55° at first, and increase it as growth advances. Water them whenever dry, and syringe early in the afternoon. *Toshina Atkins, Locking Gardens, Wantage.*

The Hardy Fruit Garden.

THE planting of fruit trees has been greatly facilitated by the open season we have experienced, and will be in most cases completed. Those trees that were planted against walls in the autumn will now have settled into their places, and may be finally nailed in, but those more recently removed should be allowed as long a time as convenient for settlement of the soil before being firmly nailed in position. Maiden trees planted with the intention of forming pyramids may now be cut back to a height of 2 feet, if they have formed no laterals; where, however, they have a fair furnishing of shoots the leader can be cut to a length of eighteen inches above the highest of the side-shoots, and the latter may be slightly shortened if it is considered necessary to encourage their extension rather than the formation of the bloom-buds which mature at the points of unpruned shoots. Label all newly-planted fruit trees before the names become illegible, using some permanent form of label that will yield its information for years. Where a conspicuous label is not wanted, a satisfactory plan is to have numbers stamped on strips of lead, with corresponding entries in the fruit-book.

The formation of new fruit gardens and orchards is often undertaken without due consideration being given to the selection of a suitable site. On many estates it is not possible to have any choice of subsoil, but in most cases advantage can be taken of shelter afforded by adjacent woods, or from elevated land answering the same purpose; and land that can be easily and effectually drained can generally be chosen in preference to that less favourably situated as to outlet. Where possible select a position having a good shelter to the north while gently sloping to the south-east, so as to catch the earliest of the sun's rays before they become too powerful, nothing being more detrimental to blossom covered with hoar-frost than hot sunshine suddenly bursting upon it. The elevation of the district has not, generally speaking, so much influence on the success or failure of fruit crops as the local relative position as to altitude of the particular site. Select in all cases where choice can be made the middle portion of an incline, to avoid the exposure of the fruit to wind on the upper part, and the colder stratum of air and late hoar-frost of the bottom. Fruit gardens formed upon light or thin soils are most suitable for being planted with bush and pyramidal trees on dwarfing stocks, which on such soils speedily yield a good return, but will probably become exhausted before standard trees planted on deep or heavy soils will have reached such a degree of fruitfulness as to be remunerative.

Form of training, and selection of stocks for fruit gardens, are, therefore, plainly matters of consideration for the individual planter, in which the character of the soil should have proportionate attention to the requirements as to speedy returns, or the no less commendable object of the ultimate improvement of the estate by leaving an established orchard of large trees for the supply of the next generation with good fruits. Frequently paddocks and small fields, already in a high state of cultivation, exist in eligible situations overlooking low-lying gardens that are unsuited for fruit culture. It is not yet too late to plant, where soil and drainage are all that could be desired, and it certainly is not expedient that we should remain so dependent upon an imported supply of fruits as we now are, if it is possible, by a judicious selection of site, stocks, and varieties, to grow them at home.

Heading-over of established trees of varieties of Apples and Pears that are considered unworthy of cultivation may be proceeded with, and scions of sorts that it is desired to increase should be taken off at once, and be inserted in earth where they will not become dried; the base of a wall with a northern aspect is a suitable position, where they will be retarded until the stocks intended for their reception are ready for them; and care should be taken to label each sort as soon as cut, to prevent mistakes and future disappointment. *Ralph Crossling, St. Fagan's, Cardiff.*

WOODEN WALLS.—"H." does well in recommending wooden walls. Let me persuade him to try Bigareau Napoleon cherry for a north aspect. I planted a tree of it on the north boarded end of a building twenty-four years ago. It produces magnificent fruit, delicious in flavour. Next to it is a Jefferson Plum.

Of this the crop is only light, but the fruit is very fine and good. On the brick wall of a house facing nearly north I have a Black Tartarian Cherry which succeeds admirably. Last year, thanks to the absence of wasps, it hung several weeks later than I have ever had it before, and was exhibited in fine order at a local show on September 9. It is a Cherry of first-rate quality. The tree has been blossoming more or less since the beginning of December, so that I am afraid my chance of a crop this year is poor indeed. The situation is about 52° 35' N., 3° 10' W., in a hilly country on the Upper Silurian formation, and about 450 feet above sea-level. The Bigareau Napoleon is about three-quarters of a mile distant, on the Lower Silurian, and about 400 feet above the sea. *Philomela.*

The Kitchen Garden.

WHEN TO SOW ONION SEEDS.—Whether from good cause or from force of habit gardeners generally make a point of sowing their Onion seeds from the first to the second week in March. Why this particular time is chosen has never been clearly defined, unless, presumably, it is not considered safe to sow the seeds before. If we could always rely upon the state of the weather being favourable at that particular date, and the ground in proper order to receive the seeds, there would be little cause for complaint; but the contrary is often the case. There is often a spell of favourable weather during the month of February—frequently towards the middle of the month—when the ground is in capital order to receive seeds if it is properly worked, but for some unexplained reason the majority of us wait until the month of March arrives, and then, if it is wet overhead and the ground is sloppy, we grumble all the while until it ceases to rain and the earth becomes dry. But it does not appear to occur to us generally that we have not made hay while the sun shone; in other words, we allow a favourable period to pass when we might have got through an important ground operation, for no sufficient reason. It is as safe to sow Onion seeds in February as it is in March if the ground can be got in proper order. Frost does not harm Onion seeds. Why, then, do we wait? It appears to me the explanation is simple. We have been accustomed to sow at a certain date, and we cannot depart from the old custom. The advantage of early sowing is shown in early growth and thoroughly ripened bulbs, which keep better and are better flavoured than the produce of later sown crops. *W. H.*

NOTES ON VEGETABLES.

A GOOD POTATO.—When one considers the quantity of new Potatoes that have been put into commerce during the last decade or so, it would reasonably be supposed that out of the number there would be some of superior excellence. But is it so? My experience, after testing about forty kinds, is that the older sorts still hold their own in quality against their later rivals; and were it not for the liberal prizes offered for as many as twenty-four varieties by the different Potato societies throughout the country, many of the newer kinds would rapidly go out of cultivation. The only new Potato we intend to retain and grow in any quantity is Covent Garden Perfection, which is a good Potato, and the best we know for a gentleman's table after the Ashleafs are over. The next best among the new ones are Woodstock Kidney, fine in quality, but a poor cropper; American Purple is good in quality and a fair cropper, but rather small; Vicar of Laleham, fine in size, and a splendid cropper, but not equal in quality to its parent, the Victoria. *Solanum.*

JAPANESE BURDOCK.—The National Horticultural Society of France has been discussing the value for culinary purposes of the roots of a Japanese Burdock (Lappa). The plant is nearly allied, if not identical, with our common Burdock, and the variety in question has been "educated" by the Japanese till the roots have become fleshy and eatable. It does not appear, however, to have found very much favour, though very likely this is a matter that a little use will soon alter. In appearance the roots are like Salsify. From the rapidity with which they grow and their easy culture, they are certainly worth a trial.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Feb. 13	Sale of Imported Orchids at Stevens' Rooms, and Japanese Lilies, &c., at the Mart, by Frothinger & Morris.
TUESDAY, Feb. 14	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 4 P.M.; Annual General Meeting, at 3 P.M.
WEDNESDAY, Feb. 15	Sale of Lilium auratum Bulbs, at Stevens' Rooms.
THURSDAY, Feb. 16	Linnæan Society meeting, at 8 P.M.
FRIDAY, Feb. 17	Sale of Imported Orchids, at Stevens' Rooms.
SATURDAY, Feb. 18	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

It is greatly to be hoped that the opportunity afforded by the forthcoming exhibition of means for ELECTRIC LIGHTING, at the CRYSTAL PALACE, will not be lost for testing the effects of the electric light on the growth and development of plants. With such facilities as will then exist at the Palace it would be almost criminal to allow the occasion to pass unutilised in this way. Power will not be wanting, and the directors of the School of Gardening, aided by the advice of practical gardeners, might readily devise a scheme whereby some practical results might be obtained. The fundamental facts have been proved, now it is necessary to institute strictly comparative experiments with due regard to cost and to the requirements of practice, so as to ascertain to what extent and under what circumstances the electric light may be made useful to horticulturists. For strictly scientific purposes the experiments would have to be carried out with great nicety and under most exacting conditions, but, for strictly practical purposes, experiments of a more rough-and-ready kind, and conducted under circumstances which might vitiate the results looked at from the abstract point of view of pure science, would answer their purpose. Whether successful or not in the main object, the results could not fail to be serviceable in some way or another, as failure would be but little less valuable than success.

We know that plants will grow under the light, we know that the actions associated with, if not dependent immediately on, their green matter (chlorophyll) take place as they do under the influence of sunlight. Now, we want to know, further, whether the whole series of changes and transformations which occur in a plant as it grows from the seedling state to maturity and reproduction will manifest themselves under the electric light. In all probability they will, but the matter requires to be confirmed, and specially, as we have said, from the point of view of the practical horticulturist. Patient experiment and careful adjusting of light, heat, and moisture are requisite, the relations varying with the kind of plant to be cultivated, the particular object for which it is grown, the local conditions, and the relative cost. But all these are points which the forcing gardener already takes into consideration, and in experiments with the electric light he would only have to avail himself of the self-same principles of action which guide him in forcing his Vines or his Cucumbers. And think of the possibilities! What is it that gives the richness and aroma to so many fruits? Not heat alone; not moisture alone; but these in combination with light; and for the special purpose just indicated the light is of the greatest importance. It is recorded of a traveller who visited Arabia to see the famous Mocha plantations that he was specially struck with the pure air and cloudless skies of the district. "Light," says he, "would seem to be poured upon the country in an uninterrupted flood, and the excessive stimulus thus communicated to all the functions of vegetation contributed to the perfect elaboration of those delicate and subtle principles upon which the aroma of the coffee depends." The same holds good with theme, the quinine, the aromatic oils, the spices, the resins, the caoutchouc, and count-

less other products which render plants valuable in one place, where they find the conditions suitable for them—valueless even where they are capable of growing at all, in another, where the conditions are unsuitable. We can furnish heat, moisture, food, skilled supervision, and management, and we all know and take pride in the triumphs effected by their agency. Our control over light has at best hitherto been fitful and imperfect. Is it always to be so? We trust not; and we look to the promoters of the forthcoming Electrical Exhibition, or whatever authority it may be, to avail themselves of the present opportunity and push on vigorously this most important inquiry.

At the same time, we must not overlook the fact that the results lately obtained in Paris are not wholly satisfactory. From the experiments lately made under the superintendence of M. DEHERAIN it appears that the electric light, under certain conditions, is injurious rather than otherwise, but that the evil effects are counteracted by the interposition of transparent glass. Plants in the open air exposed to the influence of the electric light alone have continued to grow during two months and a half, but the germination of seeds has not been favoured, nor has the maturation of adult plants been hastened. The results were obtained under the arc lights; it remains to be seen whether better results can be obtained with the incandescent lights, now becoming so popular for domestic purposes. Again, the Paris experiments have been so far exacting that they have not been made with a view of supplementing the sun's action when that was not available, as would be the case in practical gardening, but the plants have been continuously exposed to the electric light and to none other. The results, if not fully satisfactory, are by no means hopeless.

— *BOMAREA CONFERTA*.^{*}—We are now enabled to give a portrait of this magnificent species, of which we gave a full description in our number for September 10, 1881, p. 330. The illustration (fig. 31) is taken from a sketch of Mr. CARDEK, verified by comparison with specimens gathered by him near Bogota, as well as by HARTWEG at Pinchincha. The flower-stems, both outer and inner, are rich crimson. The roots have oblong tubers, similar to those figured of *B. Shuttleworthii*. The plant was introduced by Messrs. SHUTTLEWORTH, CARDEK & Co., who have lately put it into commerce.

— GLASGOW BOTANIC GARDEN.—We understand that the directors have accepted the tender of Messrs. JAMES BOYD & SONS, of Paisley and London, for the erection of the new range of glass. We should also add that the Messrs. BOYD designed the range, and that a special feature in its construction is that only Teak wood is to be used. We hope shortly to publish a view of it.

— *SENECIO SPATHULIFOLIUS*.—In the current number of the *Journal of Botany*, Professor BABINGTON figures and describes this plant, at one time confounded as a variety with *Cineraria integrifolia*. It was originally gathered in North Wales and at Holyhead, but recently Mr. BACKHOUSE has met with it in North-west Yorkshire. The same species is in cultivation in the Cambridge Botanic Garden. By the way, should not the name be written *spatuliformis*, without the *h* and with the *i*?

— NATIONAL HORTICULTURAL SOCIETY OF FRANCE.—The Council of this Society is composed for the present year of the following members:—President, M. Lavallicé; Vice-Presidents, MM. Hardy, Jamin, Malet, Prillieux and Burelle; Secretary, M. Duvièvre; Assistant-Secretary, M. Verlot; Secretaries, MM. Delamarre, Chataenay, Chagarraud, and Millet; and Treasurer, M. Maurice Vilmorin, of the well known firm of Vilmorin, Andreux & Cie. Amongst the other members of the Council we notice

the following names known in England:—MM. Truffaut, Sen., well known for his Asters; M. Thibaut, nurseryman of Sceaux; M. Margottin, Sen., of Bourg-la-Reine; M. Albert Truffaut, and M. Moser, the two nurserymen of Versailles. Editor of the *Journal*, M. Paul Duchatre. The Society will, we are told, hold three shows this year, two of which will be partial shows, and one a general show, so as to enable intending exhibitors to show in the course of the year all sorts of plants and fruits. The first show will take place from March 30 to April 3 inclusive; this show as well as the second partial show—the exact date of which is not yet fixed, but will be between October 15 and November 15—will very likely be held in the Hotel or house of the Society itself, 84, Rue de Grenelle, St. Germain, Paris, unless they take place like the big show of the season (between May 15 and June 15) in the Pavillon de la Ville, Paris; which building English visitors will remember stood in the very centre of the Paris International Show of 1878. It has been rebuilt behind the Palais de l'Industrie between the River Seine and the Palace. It is close to the place where the show of last year took place, and the pavilion is surrounded by a pretty garden. We are glad to see that this Society seems at last to be waking up to its business, viz., to spread the love of flowers throughout Paris and France.

— PLANTS IN FLOWER at FERRIÈRES.—A fine specimen of *Draecena Goldiana* has been in bloom in the houses at Ferrières. Amongst the newer Orchids that have been in flower also in the same establishment are *Bollea celestis*, with two large well shaped and beautifully coloured flowers; *Odontoglossum hebraicum*, a long spike with six or seven large flowers; and *O. tuckerianum*, something in the way of *O. Andersonianum*. *O. crispum* is coming nicely, but unfortunately with the Orchids of all sorts at this place, they are no sooner open than they are cut up for floral decorations, so that there is never such a grand show of flowers as there might be if the flowers were left on the plants some time.

— THE MYCOLOGICAL SEASON.—One of the effects of the present mild winter is the long continuance of the mycological season, and many rare or new species of Agarics have occurred. The neighbourhood of Sibbertoft, which in general is very deficient in fungi, has this winter been peculiarly prolific. In addition to one or two new species we have had *A. sideroides*, *A. hebes*, *A. obsoletus*, and yesterday only (Feb. 6) *A. Persoonianus* of PHILLIPS was found. The figure of this species in *Gard. Chron.* 1881, p. 874, does not show how the stem arises from the little bulb, as is figured by PERSSON, though he takes no notice of the attached globular bodies. The structure of these is not cellular, as in *Sclerotia*; but they consist of fascicles of threads curling about in every direction. They are densely tomentose, and it is hoped that as the place of growth is marked we may have a better opportunity of ascertaining their nature. Fungi seem equally abundant in the south of England. From Shanklin, in the Isle of Wight, we have received the short-stemmed form of *A. corrigis*, figured by CORDA under the name of *A. viscidus*. Mr. RALF has sent from Penzance an enormous specimen of *A. revolutus*, KICKX, which is clearly only a form of *A. salignus*. Not only are fungi abundant, but of extraordinary size; *A. excisus* and *A. rugosus* in our combs so large as to be scarcely recognisable, while *Coprinus aratus* is many inches across. We take this opportunity of calling attention to the work of BRESADOLA* on the fungi of Trent, which is following admirably in the steps of Dr. COOKE's excellent illustrations. Signor BRESADOLA's figures have been authenticated by M. QUELET, and we are, therefore, surprised to see an admirable figure of *Hyphophorus Wynnie* appear as *Clitocybe xanthophylla*, BRES. It is perhaps doubtful whether Bulliard, tab. 38, which is not noticed by FRIES, is not the same species, though the gills are more crowded. *M. J. B.*

— CHINESE PRIMULAS.—Of the fine quality of the strain grown by Mr. TOMKINS, of Birmingham, we have had evidence this week in some superb blooms of a bluish-white, deeply-fringed variety of large size and great substance; a very showy rose-purple, beautifully serrated, and with an attractive

* *Bomarea conferta*, Benth., *Plant. Hartweg.* (t846), p. 252; Mast, in *Gard. Chron.*, Sept. 10, 1881, p. 330.

* *Fungi Tridentini novæ vel non delineatæ descriptæ et iconibus illustratæ.* Fasc. I., tab. xv., figo. Tridentini, J. B. MONANI.

FIG. 31.—*BOMAREA CONFERTA*; INFLORESCENCE NAT. SIZE: FLOWERS CRIMSON. (SEE P. 186.)

lemon-yellow starry centre, and a good red flower, which appears to be the result of crossing the Chiswick Red on a larger flower, with a view to obtain size. It is not so good as Swanley Red, but running closely in the same direction.

LIVERPOOL HORTICULTURAL ASSOCIATION.

—The annual general meeting of this Association was held on Saturday last, in the lecture-room of the Free Public Library, Liverpool, a large number of members being present. The chairman of the committee, Mr. J. RICHARDSON, of the Botanic Gardens, presided. The Secretary, Mr. E. BRIDGE, read the third annual report and statement of accounts, which showed that the income for the year, including a balance from previous account of £234 8s. 10d., had been £1266 4s. 10d., and the expenditure £921 19s., leaving a balance at the credit of the Association of £345 5s. 10d. The progress made during the year had been satisfactory, 150 new members having been added to the roll, this being an increase of fifty over the previous year. The subscribers and members now number 712. The Patrons and Vice-Presidents were re-elected; Mr. J. HUGHES, the Mayor, was elected Hon. President; Mr. W. B. HALLIDAY was re-elected Hon. Treasurer; Mr. W. BLOMFIELD, of Aigburth, was elected Sub-Treasurer; and Mr. J. GLOVER, of Gateacre, Secretary. Thirteen members were elected on the committee to fill the vacancies of retiring members.

—A PROLIFEROUS HYACINTH.—Mr. AGGISS, gardener to the Earl of EFFINGHAM, Tusmore Park, Bicester, informs us that he has a bulb of Hyacinth *Fiancée Royale*, bearing nine good spikes of flowers.

—SMOKE ABATEMENT EXHIBITION.—The visit of the deputation appointed by the city authorities of Manchester has resulted in a decision to transport the chief exhibits from South Kensington to Manchester, and open a general exhibition of smoke-preventing appliances there upon a site offered by the Corporation for the purpose. A meeting of the exhibitors at South Kensington was held on Thursday, when the chief firms agreed to transfer their exhibits, and it was arranged that negotiations should be at once opened with the London and North Western and Midland Railway companies as to the necessary railway facilities.

THE BRITISH BEE-KEEPERS' ASSOCIATION.

—The annual general meeting of this Association will be held on Wednesday next, at 4 P.M., in the Board-room of the Royal Society for the Prevention of Cruelty to Animals, at 105, Jernyn Street, S.W., the Baroness BURDETT-COUTTS, President of the Association, in the chair.

—HARDY FLOWERS.—There are far too many gardens in which good hardy flowers are largely neglected, and where in such a season as is the present their loss is greatly felt. When the weather is so soft and open, yet so dry and pleasant that walks may be taken in the garden with frequency, it is specially disappointing to those who love flowers to find their beds and borders so barren that scarcely a flower of any kind is to be found, and that little that is more decorative than green leaves is to be gathered. And yet there are other gardens where the culture of hardy plants, and specially early blooming ones, is a strong feature, that are now almost gay if such a term may be applied to the effects created by many lovely early flowers. The scarlet *Anemone fulgens* is singularly bright, and flowering freely. Others of the *Coronaria* family are in good bloom. Early Crocuses and Snowdrops are out in flower, and making bright tufts and carpets of flower. Double Daisies in several colours, early Pansies, bright yellows, white, and blue; Polyanthus and Primroses in many and various colours, early Forget-me-not, late Hellebores, the bronzy-flowered *Atrorhena* especially; these and many others furnish bright gems all about gardens where hardy flowers are cherished. Our more modern fashion of providing big masses of glowing colours when the sun rides high and pours down its rays with almost painful force is not one to be encouraged. It is then that cool refreshing tints are most welcome. But just now a little patch of colour, even though it be of scarlet *Anemone* or yellow Crocus, is as valuable as will be an entire bed of scarlet *Pelargoniums* or yellow *Calceolarias* in July. If more widely cultivated the little patches of

hardy flowers that just now look so pretty might be masses, and be not merely pretty, but truly beautiful. With winter flowers abundant within the greenhouse, and the beds and borders gay with early hardy ones, the too often long dull winter months are robbed of their dullness, and the season of flowers is made perpetual.

—*PHENOCOMA PROLIFERA* BARNESII.—Not many hard-wooded plants are of much interest at this season, except to "specimen men" who have to be watchful of their treatment until the days lengthen and grow brighter. The subject of this notice is, however, an exception to the general rule. It is a fine plant, quite aglow with flowers open and opening, and is in the collection of F. A. DAVIES, Esq., Angelsea House, Surbiton. The plant is in fine condition, having made its growth early last autumn, with the result above stated. The side growths are also forming flower-buds, so that it promises to be worth looking at for many a month to come.

—*ACACIA LONGIFLORA*.—This plant is now finely in flower in Mrs. DUNWICH's conservatory, Allbury House, Surbiton, where it has a very rich effect as a conservatory climber. The plant is growing in a 12-inch pot, but notwithstanding its restricted root-run, it has made flowering shoots 18 inches in length which are of a bright golden-yellow, and are found most useful for cutting to arrange with other flowers. But it is as a climber that the plant is particularly recommended; planted out in a bed of moderately rich compost it would extend itself rapidly, and its long golden flower wreaths would make a very fine show in any large conservatory with *Camellias* and other kindred plants.

—THE WEATHER IN FRANCE.—The weather this winter has been unexceptionally mild until now in and round Paris. There has been scarcely any frost, only 8° Centigrade below freezing point several times, but plenty of dense heavy white fogs in the country, and black ones of course in Paris itself. A few miles from Paris the sun was not seen for nearly a month. Ice gathering has not yet been attempted.

CARNATION SOUVENIR DE LA MALMAISON.

—There is no pot variety in cultivation more sought after for supplying cut flowers than this, the queen of all Carnations. It is seldom included in the lists of very early forcing kinds, such as *Allegatière*, *Miss Joliffe*, and *La Belle*, nor is it, indeed, desirable at any time to subject it to a very high temperature. It is the best and safest way to bring it forward very gently. That it will force, however, is proved beyond a doubt by Mr. HINNELL, gr. to F. A. DAVIES, Esq., Angelsea House, Surbiton, who has a collection of it coming into flower in an ordinary forcing-house, and who has been cutting blooms of it for some time past.

—*GREVILLEA THIELEMANNIANA* is one of the most elegant of greenhouse plants. In the Cambridge Botanic Garden it has been singled out for special admiration by many from among the *Hyacinths*, *Primulas*, and other popular decorative plants. Unlike many of the genus it makes neat little specimens in small pots, loaded with pendulous racemes, and would probably be suitable for table decoration. It is attractive from its gracefulness, the leaves being so finely divided, and the flowers also peculiarly shaped and delicate in colour, almost like that of forced *Rhulabar*. It is the *G. Trevisi Bot. Mag.*, t. 5837, and is a native of Western Australia.

—THE METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 15th inst., at 7 P.M., the following papers will be read:—"Notes on Experiments on the Distribution of Pressure upon Flat Surfaces perpendicularly exposed to the Wind;" by C. E. BURTON, B.A. F.R.A.S., and R. H. CURTIS, F.M.S. "The Principle of New Zealand Weather Forecasts;" by Commander R. A. EDWIN, R.N., F.M.S. The electrical thermometer, lent by MESSRS. SIEMENS BROS., for observing the temperature of the air at the summit of Boston Church tower will also be exhibited.

—*BEGONIA ROZLIL*.—This species is now flowering in the Cambridge Botanic Garden, and though but little known is an extremely fine one. It

appears to be an ally of *B. nitida*, but is larger and more robust, and has flowers of crimson or scarlet colour. This makes it very effective. It is so distinct that those who know *Begonias* cannot fail to be struck with its character. We announced this species from Mr. E. BENARY, of Erfurt, at p. 566 in our issue of vol. xi., 1879. It is there said that the buds appear in October, and if so it flowers over a considerable part of the year, flowering, as it certainly does, also in May and June, as well as at the present time. The flowers, it was said, would be of great utility for bouquets, if not too odorous. These Cambridge specimens prove it as durable as any other species. It is a native of Mexico.

—*AZALEA AFOLLO*.—There are so many richly coloured varieties of this highly useful class of plants now in cultivation that it may seem almost invidious to single out any individual variety for special commendation. The variety above mentioned is, however, so extremely pure and delicate in colour that one may justly bestow a word of praise upon it without detracting in any way from the claims of other varieties upon our attention. The flowers are a clear pure white with pink stripes, and young plants produce flowers of immense size, which have a magnificent effect in a show-house or conservatory at this season.

—*NEPHROLEPIS DAVALLIODES* FURCANS.—Wherever a collection of Ferns is grown it should include a plant or two of this lovely species, which is a fine exhibition plant, and has few equals in point of attraction in the fernery. But this is not the season for exhibitions, nor is it so much the object to notice the especial merit of the plant in that sense as it is to recommend it as a basket-plant. As a basket Fern in winter it is exactly what is wanted, having beautiful cut fronds of drooping habit; in fact, a plant designed by Nature to fit a basket without artificial manipulation.

—HYGROSCOPIC PLANTS.—The remarkable hygroscopic properties exhibited by *Anastatica hierochuntica*, a Cruciferous plant, commonly called the Rose of Jericho, are familiar to many persons; but there are several other less known plants, inhabiting the same region, that possess the same properties in a no less degree, notably some Compositae. The most noteworthy of these is *Asteriscus pygmaeus*, a plant abounding in the plain of Jericho, which is inundated in winter. It has also been collected in Baluchistan and in the Algerian Sahara. Although in all the old works to which we have access, *Anastatica hierochuntica* is invariably given as the Rose of Jericho, DE SAULEY and MICHON, in their *Catalogue des Plantes observées en Syrie et Palestine*, question the accuracy of this determination, and suggest that *Asteriscus pygmaeus* (*Saualeya hierochuntica*) is the true Rose of Jericho. We are reminded of this circumstance by a record of this plant having been exhibited by Dr. ASCHERSON before the Botanical Society of Berlin. We do not know who first recorded the hygroscopic properties of *Asteriscus pygmaeus*, but DE SAULEY and MICHON's notice is the earliest we have seen. The plant in question is a practically stemless annual; and within a rosette of narrow leaves is seated a head of flowers; or sometimes there are several closely clustered together. When the plant has attained maturity, the leaves and bracts of the involucre dry up and persist; and so long as they are dry, they are tightly closed over the head or heads of ripe achenes. But on the application of water they spread out almost instantaneously, according to DE SAULEY and MICHON. On this account, and because they found this plant in abundance on the plain of Jericho, whereas they did not meet with *Anastatica* there, DE SAULEY and MICHON were led to believe that the *Asteriscus* is the plant known to the ancients as the Rose of Jericho. In support of this view it is stated that the *Asteriscus* and not the *Anastatica*, is represented in the arms of several French families dating back to the Crusades. It may be that both plants bear the same popular name in the same or different districts. In any case *Anastatica* grows in the plain of Jericho. Dr. ASCHERSON showed that the hygroscopic movements of *Asteriscus* are much more rapid than those of *Anastatica*, and though not as instantaneous as stated by DE SAULEY and MICHON, they open within ten minutes of being immersed in water. Another hygroscopic Composite from the same region is *Gynarrhena micrantha*—a very singular

plant, but structurally and in appearance. Like *Asteriscus pygmaeus*, it is an almost stemless plant, but it bears a large dense cluster of heads instead of usually only one. BOISSIER states that it is often buried in the moving sands, the tips of the bracts only indicating its presence. Many other plants that inhabit countries where the rainfall is very small possess hygroscopic properties in some form or other. Thus, in the large genus *Mesembryanthemum* the valves of the seed-vessels open and close under the alternate influence of wet and drought. Another property possessed by some, at least, of these plants is the rapid germination of their seeds when exposed to moisture and heat. The seeds of *Anastatica*, for example, will germinate in less time than common *Cress*. Dr. ASCHERSON incidentally called attention to the biological antifeed offered by *Carlinia acaulis*, in which moisture causes the bracts to close over the flowers, whereas in dry weather they are spread out and expose the flowers—an adaptation to the same end by a different means, to meet the exigencies of a different climate.

— *ACACIA DRUMMONDI* IN SMALL POTS.—Plants that bear a moderate degree of exposure and are not susceptible to much injury from a low temperature, are never too plentiful in the early spring months, from January to March. In this *Acacia* we have a flowering plant of considerable merit for all ordinary decorative purposes, but especially as a window plant, either by itself or in groups among other plants. Its peculiar foliage of rich glaucous hue is at all times pretty, and its appearance is of course enhanced when the plant is in flower. It flowers so freely in a small state under very gentle forcing, that gardeners and market growers should not ignore it as they generally do. There is no reason why a plant, which is looked upon as a good conservatory shrub, should not be grown of convenient size for indoor embellishment of all kinds, and the horticultural public would readily welcome a change which would in a slight degree relieve the sameness of material that now finds its way into the horticultural market.

— LINNEAN SOCIETY.—The papers to be read at the meeting on Thursday, February 16, at 8 P.M., are:—1, "Potato Disease and the Theory of Fungoid Parasitism," by A. STEPHEN WILSON, 2, "The Shells of Aden," by Lieut. J. F. COCKBURN.

— THE OLD DOUBLE WHITE PRIMULA SINENSIS.—It is not always that the law of the survival of the fittest applies to garden plants, or rather the law is artificially interfered with; but in the case of this fine old subject it does appear likely that it will long survive the newer double varieties of recent introduction, handsome as they undoubtedly are. For the past twenty years we have had, if not frequent, at any rate a fair addition of new double forms to our lists, culminating in Mr. GILBERT'S fine batch, but for habit, endurance, freedom of bloom, and great usefulness, none of them can claim such individual characteristics as the foregoing as they are seen summed up in the old double white. Mr. BARKON has now in flower at Chiswick a batch of plants that illustrate in a remarkable degree all the fine characteristics attributed to the double white *Primula*. What new variety of any colour furnishes a tithe of the bloom on individual plants? The blossoms of the new types are certainly larger and more symmetrical in shape, and used individually are of good service in bouquets and button-holes, but it is difficult to cut useful trusses of bloom as from the double white. The fact that the new varieties are but sparingly grown, while the old is grown more than ever, is another test of its greater popularity, and something must be said on the point of habit. How seldom one sees good plants of Mr. GILBERT'S new varieties. Those who grow the old double white to perfection can scarcely produce any thing like respectable specimens of the former. It may be that they have been somewhat severely propagated to get stock, and this frequently leads to constitutional debility. This may right itself in time, if the varieties remain long enough in cultivation to obtain greater vigour. Even then the wonderful profusion of bloom on the part of the old double white will make a popular plant, likely to survive several generations of gardeners.

— *LIBONIA PENNOSIENSIS* x.—This plant is not nearly so well known as the commoner variety, *L. floribunda*, which is a much taller grower, but is

not nearly such a bright flower for cutting as *L. pennosiensis*. Both require similar cultural treatment, but the latter will be found the most useful for basket or vase work. It also makes a very neat border plant for front rows of greenhouses arranged alternately with white Tulips of the Valley.

— A PRETTY WINTER COMBINATION.—This was formed on the front of a mansion by planting the red-berried *Pyracantha* against the semi-columns, or more prominent parts of the building, and a green-leaved Ivy against the panels. It will be observed that the *Pyracantha* has this season generally borne a rare crop of berries, that stand out in vivid aspect against the dullest weather and the most laden sky. The Ivy employed should not be too robust a grower or too large in the leaves, and which should be kept within bounds by careful manipulation, taking care to have it as fresh and green in winter as possible, when some leafy favourite of Nature on walls gives an agreeable contrast to the naked branches of deciduous trees. *Juniperum nuditiform*, *Cydonia japonica*, and the bright berried *Pernettya* might also be employed in association with Ivy, but give us the *Pyracantha* for choice.

— LOCAL CONDITIONS IN RELATION TO THE EFFECTS ON PLANTS OF THE SEVERE WINTERS OF 1879-80 AND 1880-81.—The uncertainty of the effects of frosts of the same intensity has often been recorded, and it has been ascribed to various causes. Yet after all it is very dangerous to generalise on the subject, as the experience of the last two winters shows. We can safely say that the frost killed certain trees and shrubs, but often we cannot define the conditions under which they would not have been injured, or if injured, not killed outright, by frost of the same intensity. How often has it happened that of a number of individuals of the same species, intermixed and apparently equally vigorous, and under precisely the same conditions, some are killed, some more or less injured, and some remain uninjured. Of course, although the conditions are apparently the same, and the degree of vigour apparently the same, yet differences must exist, and each case can be differently explained. It is well known the two seasons named were very disastrous in Paris and its environs. M. PISSOT, the Conservator of the Bois de Boulogne, has a very lengthy article on the losses sustained in the Bois, specially examining the local conditions, &c., in which he refers to the *Revue d'Arbiculture*, which will interest some of our readers, but it is too long to give even a summary here.

— GEONOMA SCHOTTIANA.—This is one of the best of Palms for decorative purposes and furnishing generally. It is handsome, graceful in habit, and withal a plant that the most fastidious taste could hardly take exception to. Plants for decorative purposes have to be taken at a certain stage of growth, their real beauty is to be enjoyed to the full. The plant in question is often disposed in a small state, as well it might be, for it never develops its real leaf beauty until it is well grown in a 32-pot.

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending February 6, issued by the Meteorological Office, London:—The weather during this period has been characterised by overcast skies and dense fogs and mists, which very little rain has fallen. Temperature has been a few degrees above the mean for the season in Ireland and Scotland, equal to the mean value in the south-west, west, and north of England, and slightly below it elsewhere. The maxima varied from 48° in "England, E.," to 55° in "Ireland, S.," while the minima ranged from 21° to 28° over England, 27° to 30° in Scotland, and 32° to 34° in Ireland. Rainfall has been much less than the mean in all districts. Bright sunshine shows a very slight increase; the percentages varying from 32 in "England, S.W.," and 27 in "England, E.," to 7 in "Scotland, W.," Depressions observed:—The barometer has continued highest in the east and south-east parts of our area, while a few depressions have passed northward or north-eastward outside our westward and northern coasts. The wind during the first two days was fresh or strong in force, but afterwards continued moderate or very light. In direction it was generally from between S.W. and S.W., but towards the end of the period it became very variable, especially in the east and south-east.

— GARDENING APPOINTMENTS.—Mr. W. J. GARDINER, late of Broxbournebury, Hert's, has been engaged as Gardener to A. DOUGLAS, Esq., Chilstone Park, Sandway, Kent.

JOTTINGS ROUND SURBITON.

GLENCAIRN, the residence of J. H. Bryant, Esq., Surbiton Hill, is noted for its extensive ranges of fruit-houses, many of which are erected on Rendle's patent system, and produce excellent crops of fruit. The principal display of flowers is in a vinery where the Vines are at rest. The plants are grouped upon a stage running parallel with the back wall of the vinery and consist of samples of the double flowering Peach, with its large double blossoms so charming for cutting in mid-winter; a fine show of *Azalea mollis*, and other early *Azaleas*, *Spiræas*, *Primulas*, *Hyacinths*, *Lilæes* (Percy) forced in small pots, *Epiphyllums*, and large plants of *Imanophyllum* miniatum. Such a choice collection of flowers gathered together in a cool fruit-house is highly creditable at this season, and shows what can be done by a practical man by the exercise of intelligence and forethought. There are several small plant-houses in which there are what gardeners commonly call "choice lots"—something to surprise your neighbour when he comes to visit you, and perhaps to yield no small pleasure to the cultivator as well. There is one plant which is a very fine example of its kind, an *Anthurium Scherzerianum* over 4 feet in diameter, and with leaves 14 inches long, and more than 3 inches in width. This plant is said to be "Daines' variety," and is a specimen far too good to be long kept in obscurity. That graceful Fern-like plant, *Paulownia thalictroides*, is grown for training round baskets of flowers—a purpose for which it is eminently adapted, but the plant is not common enough in our gardens, at any rate in large gardens where there is much furnishing to be done, and not over-much to do it with. *Rogiera cordata* is coming into flower, and there are several *Orchids* producing flowers in abundance, which hang gracefully among Ferns of the greenest green, and bordered with *Gloxinias* in flower, mosses and Ferns of the dwarf Maidenhair type, and small foliage plants, rare of their kind and beautiful to look upon.

ANGLISEA HOUSE.—This garden is chiefly notable for its collection of specimen plants, the property of F. A. Davies, Esq., which are well known at some of the leading exhibitions round London, but especially in the neighbourhood of Surbiton, where they are grown. The best specimens consist of hard-wooded *Ericas*, of which *E. tricolor dumosa* is over 5 feet in diameter, and is in fine form for exhibition. The plant flowers about May, and a photograph of it shows what a picture it must be when in bloom. Among other specimens I noticed a noble sample of *Erica Cavendishiana*, *E. ventricosa coccinea* minor, said to be the finest plant in England, except one in the collection of J. F. Greswolde Williams, Esq., of Worcester; *E. Lindleyana*, *Darwinia tulipifera*, *Erica Bothwelliana*, *E. tricolor* Wilsoni, *E. Afioni* Turnbulli, and *Dracophyllum gracile*. The collection is altogether in superb health, as also *Azaleas*, a choice selection of specimen and half-specimen Ferns, and *Orchids*. In the *Orchid*-house many plants are in flower, including *Zypetopetalum Mackayi*; *Lælia* anæther, with from seven to ten spikes on a plant; *Oncidium*s, *Phaius* Marshalli, and several *Dendrobium*s and *Cypripedium*s. The conservatory is bright with *Azaleas*, *Deutzias*, *Epacris*, and other spring flowers, clearly showing that the specimens do not receive all the attention. The collection has been under the management of Mr. Hinnell for many years, and great credit is due to him for the skill and pains he has taken in cultivating the plants, many of which have been nursed by him from their infancy.

ALBURY HOUSE.—This is one of the most charmingly designed and situated of suburban gardens, the seat of Mrs. Dunwich, Surbiton. The approach to the house is spacious, and as trim and neat as hands can make it. The shrubs bordering upon the drive are of the most select kind, but the principal objects are two fine berried *Aucubas* upon either side the front door, planted in grass. These plants have in former years borne large clusters of berries which, when coloured, have been delightful objects to look upon, the variegated leaves of the plants being large and healthy, showing off the clusters of rich coral-red berries with good effect. The boundary walk curves naturally, and the trees and shrubs are so disposed as to give privacy, shelter, and an artistic appearance to the whole arrangement.

Where it has been found necessary to block out unsightly objects the trees or shrubs employed for the purpose have been chosen of the graceful type, thus combining the useful with the ornamental. For example, where a shrubby border has been raised, and hardy or common plants have been used to break the force of the winds, a zig-zag row of the graceful *Pinus excelsa* is planted in front on the grass lawn, leaving the walk intervening between the shrubbery and the more ornamental plants. Farther on in a corner of the grounds seclusion and shade are provided by a handsome weeping Ash trained umbrella-shape—a perfect model of its kind. One might enlarge upon the skill displayed in many quarters of the grounds, but suffice it to say that the garden is bright in variety, and contains many examples of choice shrubs. The flower plots, too, and the terrace garden, afford sufficient scope to have spring and summer flowers in any variety without disturbing the balance of parts or the unity of the arrangement as a whole. The conservatory is large, relatively rather too large in proportion to the extent of the place. It adjoins the house, and is gay with *Acacias*, *Camellias*, *Azaleas*, and other seasonable flowers; stands for pot plants are fixed round the sides of the building, and in these the choicer kinds of flowers are arranged in groups, chiefly in pairs to match—*Primulas*, *Cyclamens*, and *Echeveria pulverulenta*, which is a perpetual bloomer throughout the winter. The fruit and plant houses are faultlessly arranged and equally well kept; there is not a brush out of place, much less a plant, in this trim, well-kept garden. A group of *Carnations* (*Souvenir de la Malmaison*) struck me as being very well done in 6-inch pots, grown upon single stems, each bearing half a dozen flowers at the opening stage. Winter-flowering *Begonias*, *Felargoniums*, as, indeed, stove and greenhouse plants generally, are well grown in successional order, and in sufficient quantity to keep up a regular and constant display of flowers and plants for general decorative purposes, which is the prevailing fashion now-a-days in every private garden. The fruit-houses yield heavy crops annually, and hardy fruits and vegetables are also successfully grown, and of approved quality. *Visitor*.

WHITCHURCH RECTORY.

MR. NORMAN has his favourites near at hand, for adjoining his study, from which leads a door, is the first *Odontoglossum*-house—a lean-to, some 60 feet in length, facing northwards, filled principally with *O. crispum*; Ferns growing on rockwork cover the back wall. There is a stage about 4 feet wide running round the front and half-way along the back. On this stage there are about 1500 examples of *O. crispum*; many of them are large plants of some years' growth; the bulbs on some of the specimens are from 4 to 5 inches long, and correspondingly thick; the foliage is bright green, with a metallic blue, indicating the best condition of health. Suspended from the roof are about 60 good-sized baskets of *Masdevallias* of the *chimera* and *bella* type. I noticed also half-a-dozen fine plants of *M. chimera*, represented by the collector to be the true variety; it differs from the ordinary form in having the terminal threads of the sepals much larger, and the flowers of a brighter colour.

Here, likewise, is a very extraordinary variety of *Masdevallia*, which Mr. Norman calls the *gnat*, or *M. culex*; the flowers have not yet been subjected to the opinion of the great authority in Orchid nomenclature, Professor Reichenbach. It is always in bloom, and throws a long, branching, thread-like spike, which bears flowers on every branch, the flowers having a life-like resemblance to a large spotted gnat. They are suspended on stems no thicker than a thread, and all but invisible. This is a very curious plant, and I suspect quite new. Mr. Norman informed me that it was imported from the United States of Colombia. There are also good baskets of *M. Vesperalis*, the singular flowers of which resemble the face of a bat; *M. Nycteria*, *M. tovarensis*, &c. Over the central path is trained a good specimen of *Lapageria rosea*; it is grown in a large pot, and its stems run over the path. Under the stages, as well as over all the walls of this house, Ferns luxuriate and grow in abundance.

From this I passed into the show-house, which is furnished with plants in bloom all the year round. *Masdevallia tovarensis* was here well-flowered, and many other winter-blooming plants. Preceding on-wards there is another house entirely filled with *Odontoglossum*

crispum in fine health. There are not less than 3000 plants in this house, many in bloom, amongst them being some extremely beautiful varieties, with spikes of from twelve to fifteen flowers; in one plant the individual blooms were $\frac{3}{4}$ inches across. As known to cultivators, this *Odontoglossum* is remarkable for the endless variety of form and markings in its flowers, so much so that it is almost impossible even in a large collection like the one under notice to find any two alike in every respect. The texture of the flowers, which makes them so enduring, their purity of colour, and the variety of marking in all the parts renders it one of the most charming and popular of all the Orchid family. It is also a plant so easy of cultivation that its popularity is likely to increase, and the demand for it to become still greater than it already is.

We now come to a span-roofed house with a centre table and a stage all round. This house is occupied by *Odontoglossums* and cool-growing *Oncidium* of many kinds; as also *Masdevallias* in variety, noticeable amongst them being a few plants of *M. Reichenbachiana* which first flowered with Mr. Norman in 1875. This is the only collection I believe in which it has appeared; it was shown by Mr. Norman at a meeting of the Royal Horticultural Society, South Kensington, and certificated. Its flowers are of the most fantastic shape, bearing a resemblance to a stork with its head and bill resting on its breast when seen in front: the colour is yellow, orange, and red. There are also a few plants of the true *M. elephantipes*, introduced by the New Plant Company, Colchester, of which Mr. Norman holds the stock; *M. ignea* or *coccinea*, in large masses in bloom, one specimen having over thirty flowers; *M. infracta*, *M. Wagneri*, *M. trochilus*, very fine—leaves, including peduncle, 14 inches long by $2\frac{1}{2}$ inches broad, and with a large flower-stem; *M. Shuttleworthii*, bearing six flowers; a fine variety of *M. Harryana* and *M. Veitchii*: these occupy one side of the house. *Oncidium macranthum*, many varieties with large spikes, *Odontoglossum triumphans*, there is also in bloom the variety of *O. luteo-purpureum* scepterum, introduced by Mr. Sander; and *O. polyanthum* has flower-spikes. This plant will always be scarce, it is most difficult to import alive, and difficult to establish when imported. Many thousands have been imported of late years, but few have survived the ordeal of the long journey. In this house *Maxillaria grandiflora* was blooming; it is as beautiful as *Lycaste Skinneri* alba.

In the next house are some good plants of *Cymbidium eburneum*, with spikes containing three and four flowers each. These have been grown with the *Odontoglossums* and are in the best of health; it is not long since this Orchid was here grown with the Cattleyas, it is now found that its proper temperature is with the *Odontoglossums*. *Dendrobium Wardianum* is grown under the same conditions, and is quite as successful; *Coclogene cristata* is also here in fine masses with large bulbs, and bristling with flower-spikes. Then comes another span-house filled from end to end with healthy plants of the popular *Odontoglossum crispum*, the stock of this species alone consisting of from 7000 to 8000 plants. In this collection I was much struck with the very large number of hybrid varieties of *Odontoglossum*, varying in colour from light primrose to rich dark yellow, and spotted in every conceivable way. They are principally natural crosses between *O. crispum* and *O. gloriosum*, and are very interesting.

From this we enter the vinery. The three favourite varieties of Vines grown here are Tynningbame Muscat, Black Alicante, and Victoria Hamburg: these supply fruit from September to Christmas. In this house there is a centre bed, 20 feet by 12 feet, which is filled with two large plants of the old white *Camellia*, in excellent condition, 10 feet high, and covered with flowers.

The Cattleya-house has a sunk path and stages on both sides. It is kept damp in winter as well as in summer, the sphagnum on the plants being just wet enough to maintain its verdure. The night temperature is about 60°. I noticed that the pots were crocked nearly to the surface, and that the peat-fibre and moss used did not exceed 2 inches in thickness; the roots of the Cattleyas and *Laelias* were growing through it, and penetrating amongst the crocks and round the outside of the pots freely.

There are some fifty plants of *Cattleya gigas*; many

of them bloomed last autumn, and are now at rest; their foliage was all that one could desire. *C. Imperialis*, a variety of *C. gigas*, and *C. Normanii* are also here. *C. Dowiana* is represented by about forty examples, some with from seven to ten leads, several having flowered in the autumn. Two plants of *C. exoniensis*, the finest of Mr. Domy's hybrids, were in bloom, one with white segments, and the other of a dark colour. Here, also, were several small plants of the autumn blooming variety of *C. labiata*, which is very beautiful, and now scarce. Mr. Norman is a well-known admirer and successful grower of Cattleyas, and in his collection are many of the new varieties introduced recently, which we hope to hear a good account of at no distant time. In addition to these are many rare Cattleyas, including several of the *C. speciosissima* section, amongst which are *C. Bassettii* and *C. Dawsonii*, both extremely scarce. There are some select varieties of *Phalenopsis*, which are now showing large branching spikes; and there is likewise a selection of the East Indian species, but the collection consists principally of the cooler and intermediate kinds.

There is one feature which I ought to refer to before I close, which is, that in preparing the peat for potting, every particle of earth is shaken out of it, and nothing but the fibre is used with sphagnum. Of this mixture only a thin layer is employed; beyond this the pots are wholly filled with drainage material. With the different varieties of Orchids so treated the best results ensue, and I have scarcely ever passed through a collection in better cultivation than this. Mr. Cowley, who has for some time had charge of it, is to be congratulated on his success. A matter especially noticeable is that the plants, with their pots, the stages on which they stand, and everything in the houses collectively, evince such scrupulous cleanliness and order as are rarely met with, and which doubtless contribute in no small measure to the general healthy state of the stock. Since last I saw them the stages in the various houses have been raised nearer the glass, so as to afford more light to the plants—a condition which for many years, when referring to the cultivation of Orchids, as well as almost all other plants, I have never failed to urge the necessity of. *T. B.*

HANGING BASKETS.

Of these it may almost be said that they are going out of fashion, and yet, when well planted and carefully looked after, they are objects of beauty, and have a special fitness of their own in a conservatory. It is now so much the practice to plant greenhouses with creeping plants which, like *Cobaea scandens*, *Tacsonia van Volxemi*, and others of like character soon cover the inside of a house, and droop their shoots in natural and elegant festoons, that hanging-baskets are scarcely needed, and yet they fulfil a very useful service. In corridors and halls of dwellings where there is sufficient light and warmth to keep the plants in good condition their presence is in harmonious contrast with the surroundings.

The great thing is to plant judiciously, using subjects that will stand well in such places as permanent objects. At this season of the year, when there are plenty of Hyacinths, Tulips, *Begonias*, and other winter and spring flowering plants in blossom, some pretty designs of a temporary character can be formed, and when first planted should be hung up in a temperate house for a few days before being taken into the dwelling. More enduring arrangements can be formed of such plants as *Ficus elastica*, *Aspidistra Ludia variegata*, the hardier *Dracenas*, the common Creeping Jenny, variegated *Saxifrages* of prostrate or pendulous growth, and others too numerous to mention. The selection of subjects must depend on the position the basket is to occupy, and the degree of warmth and light generally present. Gas, too, has to be reckoned with, and this, while only less injurious to foliage, is very hurtful to many flowers. As hanging wire baskets are constructed with movable zinc bottoms to hold moisture and prevent it from dropping on to the floor, there is no reason why a hanging-basket should not occupy a handsomely furnished room.

A little experience is an excellent teacher as to the proper selection of plants. Many schedules of prizes of horticultural societies contain a class for a hanging-basket of plants, and when the tent or building in which the show is held is sufficiently elevated, a line of handsome hanging-baskets is an attractive feature.

It sometimes happens that no provision is made for suspending these baskets, and they have to be fixed in position as best they can. The managers of a show should always provide strong cords with which to suspend the baskets over a strong rafter in the tent, taking care to have them on the same level and not on too great an elevation. It should always be a condition of a competition of this kind that the baskets be filled at least a month before they are exhibited. In the absence of any such condition exhibitors will fill their baskets in a very effective manner and with great taste the day before the show is held. The result is, that if the weather be hot and drying, the plants, turned out of their pots, and the soil reduced, occupying an elevation in the hottest part of the tent, soon flag and become unsightly objects by evening.

When baskets are temporarily filled in this way it should be done with plants growing in pots, so that no flagging can ensue. Of all hanging-baskets probably none can compare for effectiveness and continuity of display with those filled with *Achimenes*, which Mr. Speed cultivates at Chatsworth with such marked success. They are none the less successes on account of their great size, and this is quite in keeping with the houses in which they are suspended. A hanging-basket of *Achimenes* might prove a good feature in a schedule of prizes.

A NEW VARIETY OF PEZIZA AURANTIA.

PEZIZA AURANTIA, Fries., is one of the best known because one of the commonest and most beautiful species of fungi, never failing to attract the attention of all who love woodland scenery. It is very constant in its general characters, but is apt to vary a little in shape, owing to its often crowded condition, causing two or three individuals to interfold in such a manner that they may easily be taken for one. Though the cups are often oblique, the one side outgrowing the other, the normal form is that of a saucer, with a somewhat undulating margin, as represented by Bulliard, in his excellent figures F, A, H, plate 474. The colour of the disc varies but little, ranging from bright to dull orange.

The most constant character is found in the sporidia, which are invariably elliptical, and coarsely asperated, often possessing a projecting, oblique spike at each extremity. My friend, Mr. C. B. Plowright, of King's Lynn, has sent me fresh specimens of this species, presenting a feature I have never before observed in the hundreds of specimens I have hitherto gathered. The microscopic hairs of the margin, seen best in young specimens, described by Fries in these words, "Margine primo subtiliter villosa," which are nearly colourless in the common variety, are in these Norfolk specimens nearly black, forming a dark margin to the cups. These hairs are very obtuse and stout, dark brown by transmitted light under the microscope, having three to four septa. They spring from comparatively large cells, the walls of which are also dark brown.

I cannot detect any morphological difference between Mr. Plowright's specimens and the common form of *P. aurantia*, but the black-brown hairs form a conspicuous character even to the naked eye, and which, therefore, deserves to be noted. We propose to distinguish this variety thus—*Peziza aurantia*, Fr., var. *atro-marginata*, Ph. and Pl.

In looking over some of our older English authors I find that *Peziza aurantia* appears to have attracted notice at a very early date. In Dr. Christopher Merrett's *Pinax Rerum Naturalium Britanniarum*, 1667, at p. 43, I find the following:—"Fungus rotundus scartatinus odoratus. At Church Leung, Worcestershire," which I take to be *P. aurantia*. The agreeable odour of this species reminding one of *Cantharellus cibarius*, Fr., the colour also of which is similar, and may have some connection with the odour, is a very striking character. The species described on p. 42 as "Fungus rotundus superne convexus et translucidus coloris succini, in Mr. Morgan's garden" may be *Peziza vesiculosa*, Bull, and the other immediately following:—"Et alter coccineus coloris, in St. James's Park, in the winter time on old decayed trees" is probably *Peziza coccinea*, Jacq. W. Phillips, *Shrewsbury*.

TRADE MEMORANDUM.

CAN any one oblige us with the present address of Ambrose Knight, who in November last resided at Wallyheat, near Dudley?

HOME CORRESPONDENCE.

Root-space for Vines.—Readers of the horticultural journals who read them with the intent to practise all the teachings therein recorded must surely sometimes be in a state of great perplexity, seeing that what one writer this week advises another is just as likely to condemn in the issue of next week, and yet both writers have doubtless given a faithful record of their own practice on the subject in question, and though the writer of this (being a practical gardener) may not be considered a disinterested person, he ventures to express the opinion that his compeers are far too honourable a set of men to, knowingly at all events, attempt to mislead any one. If such be the fact, and it is, how shall we reconcile the discrepancies, contradictions, and the constantly recurring record of contrary opinions and practice? Why, simply by the use of brains. To read what one says and does is all very well, but if unaccompanied by thinking for oneself such reading will prove of little avail; happily there are few gardeners that can be placed in this last category, hence their differing practices ending as a rule in results of equal merit. These remarks were suggested by a paragraph in the notes on "Grape Growing at Wheatstone," p. 78, which runs thus:—"The older Vines, some of which have been in between twenty and thirty years, are mostly in borders of ordinary size, that is, with a considerable space wherein the roots can extend, whilst those that have been planted more recently have borders unusually limited in extent—not more than 6 feet wide by 4 deep—beyond which the roots cannot get," and yet the crops of fruit from both examples of borders have been satisfactory. To a superficial thinker a very natural thought on reading this would be, If from 6 feet borders I can get the same amount of Grapes as from 20 feet, it is surely not worth my while to be at the trouble of making borders of the greater width. Nor is it, provided that—ah! easily led friend, that "provided" should be your finger-post directing you to, as it were, re-measure the two borders: they are made differently, and treated differently, that is, each according to what is required or expected of it. For instance, it would be unreasonable to suppose that any one would think of restricting the roots of Vines to 6 feet and not use means to feed them more liberally than in the case of those in larger borders; and equally unreasonable would it be to expect root-restricted Vines to continue for as long a period in a vigorous state as those that had, comparatively speaking, unlimited root-space; but by varying the treatment to the wants of each just as good Grapes can be grown in one way as in the other. Having tested both ways, and that with a fair amount of success, we give preference to the larger borders, solely on the question of labour and materials; could we have these without stint then unhesitatingly we should adopt restricted borders and go in for high feeding and frequent renewal of Vines. Precisely the same rules are applicable to inside *versus* outside borders, but it may be added that the former are now generally admitted to be the best for very early and very late Grapes, for the obvious reason that extremes of weather cannot affect them. *Vitis*.

Boxwood Labels.—A few weeks ago I recommended Boxwood labels, and a week or two afterwards a note appeared from a correspondent saying that he found them generate mildew. I am sorry to say that I too now find this to be the case, but only when the labels are used in a frame or house; on those used in the open air, which have been out for many weeks, I can see no trace of it. Still I am unwilling to give up the use of these labels in pots without further trial, and I am told by an authority on such matters that soaking the labels for a few days in a weak solution of chloride of zinc will effectually prevent their ever generating any mildew. *C. Wolley Dod, Edge Hall, Malpas*.

Abutilons in Tubs.—Perhaps there is no flower cultivated during the winter months that is of more service to the florist and bouquetist than the *Abutilon*, especially the white variety, *Eoule de Geige*. What is useful to the florist is equally useful to the private gardener, though it is doubtful whether the latter is as ingenious as the former in manipulating flowers and turning them to good account. But it is some-

thing to possess them in abundance, and this the ingenious florist can manage to accomplish in an unpretentious way, which sometimes evokes the admiration of critics. It is well known that *Abutilons* make marvellous growth when planted out, and bear flowers in proportion to their foliage, but the florist wants quantity rather than size, and so he steers a middle course in his system of cultivation. I lately saw two fine plants growing in tubs quite a picture of white flowers, and as large as an ordinary-sized *Camellia* bush. The bottoms had been knocked out of the tubs, and the plants were rooting in the border underneath. The tubs had been in common use, and were practically valueless except in so far as they answered the florist's purpose in restricting the vigour of the *Abutilons*. *W. Hind*.

Early Strawberries for Market.—"Market Gardener, Darlington," in search of a very early Strawberry, had better try *Doncan*. I planted in the open some of this sort in February last year, and its fruit was ripe five days before that on my established plants of *Black Prince*, for many years past my earliest, and five days at the beginning of the season is a very great advance. With me *Vicomtesse d'Artois* is little earlier than *President*. *Philobolus*.

Magnesium Salts: Their Influence on Vines.

—A case of considerable importance in Vine culture has just occurred here, which, I think, will be found generally interesting to the readers of this journal. A gentleman, possessor of a valuable system of vineries, became alarmed at the condition of the Vines in two extensive hothouses. The Vines in these two houses had yielded excellent crops last season, and being young, well grown, and vigorous, high hopes were entertained. The Vines were started earlier than usual, but not earlier than is the custom with some growers here; at present they show a fair amount of foliage and a promising crop. The week before last the gardener (a most intelligent and successful one, and thoroughly up to his work) noticed that the Vines began to flag, the leaves drooped and the whole appearance gave evidence of root mischief. The roots were bared and it was found that the root-fibres were softened and decaying. It was also evident that new rootlets were forming but these lacked the usual vigour and would not succeed in taking the place of the decaying ones. The gardener at once saw that the mischief was in the borders, but was conscious of no fault in their treatment. Just at this time he noticed that the steaming trays were producing clear crystals, and that they formed rapidly. He then suspected the water which was being supplied to the Vines, and procuring a sample from the tanks and some crystals from the trays hurriedly brought them for an opinion. I found the crystals to consist of clear deliquescent masses containing a large percentage of chloride of magnesium. The tank water contained small quantities of lime, potassium and sodium salts and large quantities of magnesium salts, the water giving very heavy magnesium precipitates without concentration. The cause of the mischief being thus indicated, no time was lost in washing the borders with pure water, followed by suitable dressings of chemical manure, with the effect, I am glad to say, of a decided improvement, but it is still too early to speak of ensured success. Having done all in our power for the Vines, a visit to the estate and analyses were undertaken with a view to discover the source of the magnesia. The following are the facts elucidated and conclusions arrived at. As regards the water supply:—(a.) The estate is within 200 yards of the sea. Every breeze and gale covers the glass-houses with marine saline deposits, and these, of course, find their way into the tanks with the rain. This, of itself, cannot be the source of the magnesia, common salt being present in too small a proportion. (b.) The water from a well (supplied to the houses and tanks by a steam pump) was found to contain only the equivalent of 3 grains of oxide of magnesia (MgO) per gallon. (c.) A natural spring dripping from the face of the rock and collected in a narrow pond formed the third supply, which was used occasionally only. This was tested *in situ*, and gave decided indications of magnesia, of course without concentration. This had been supplied to the steaming tanks on the morning of my visit, and from thence I obtained concentrated water, which gave precipitates of magnesia. The Vines have inside borders, which are provided with bottom pipes. The tanks are two in number, and are warmed by waste heat as follows:—The first is built behind a boiler-house, and becomes heated to from 56° to 60° F. The second (of much greater capacity) is warmed by the hot-water pipes in its house, but this source of heat can be used as required. The moderately warm water thus obtained is used on the inside borders, and last season the system proved an unprecedented success. The water from the tanks contained, on the discovery of the mischief, quite ten times the amount of saline matter of any

water on the premises, hence I conclude that a gradual concentration takes place, until at last the water is strong enough to be injurious. It must not be forgotten that no rain has fallen for three weeks, therefore nothing interfered with the concentrating process. The preventive is evidently the periodic examination of the tank-water, and if necessary the emptying of the tanks. The underlying rock is metamorphic; the wells in the district are all more magmatic than the remainder in the island. *Adolphus Cellens, Guernsey.*

Vines and Camellias in the same House.—It can hardly be said to be anything new to grow Vines and Camellias in the same house, but perhaps two more profitable crops cannot be grown together, in which the cultivation of the one does not interfere with the wellbeing of the other. At Ashley Park, the seat of J. S. Sassoon, Esq., Walton-on-Thames, Surrey, Mr. Sutton has been cutting Camellias since last August from plants trained upon the back wall of a viney, and also from others planted out in the body of the house. The display of flowers does not appear to diminish, every day bringing forth a fresh supply of open buds. The Vines are of course planted in an outside border. Admitting that the viney is occupied the whole year with the Vines and Camellias, the latter being planted out, it is more than doubtful whether an equal return would be obtained by any other arrangement. There is a front stage over the hot-water pipes, which is convenient for stowing bedding plants in winter, but, with this exception, the Grapes and Camellias are the only crops which can be attempted to be grown in the house. The present would be a good time to proceed with such an arrangement. Whatever Vines are to be forced or whether they are only to be partially assisted with fire-heat the Camellias should be planted in time to be started along with them in order that both may keep their growth together, and by the time the Camellias require shade the Vine leaves will supply it free of cost, and as they colour and drop in the autumn light will be again admitted in sufficient quantity to assist the flower buds to develop at a rapid rate. The duration of the blooming season is prolonged because of the additional growth the plants make when planted out, and in houses that are forced a little early the flowers come in at a season when they are most valuable. Mr. Sutton, who is an excellent fruit and plant grower, speaks highly of the system, and the results as seen under his management bear out his words to the letter. *H. Z.*

Strelitzia Regina.—I was pleased to note a short paragraph at p. 86 referring to this somewhat singular and interesting old Cape plant. From the fact of its introduction from the Cape of Good Hope in the year 1773, and its naming in honour of Charlotte, Queen to George III., of the house of Mecklenburg-Strelitz, it may also be said to have some claim to be regarded as a historical plant, and as one which is worthy of cultivation in the most *recherché* collection of stove and greenhouse plants. In the gardens of T. Isherwood, Esq., Springfield House, Leywood, Manchester, there may be seen at the present time a grand old specimen with seven spikes; last year it bore five spikes, and four in the preceding year. When a plant flowers for a few years in succession like this, it is evidently receiving the right treatment, and doubtless many of your readers who are not quite so successful in flowering it as Mr. Sylvester, the gardener at Springfield House, may be glad to become acquainted with his *modus operandi*. The secret of success in this case—as in countless numbers of others—is in a nutshell, so to speak, and is as follows:—Cool temperature but full exposure to the sun's rays at all times; plenty of water overhead and at the roots (except in the period not exceeding a fortnight in the year of compost being needed than good fibry peat mixed up with plenty of potsherds and silver-sand. It may also be remarked that the plant in question is put into a cool viney in August; there it remains until the flower-spikes appear, then it is removed to the conservatory. From this it will be seen that the words "full exposure to the sun's rays" must be taken in a comparative and not in a literal sense, as there is a slight amount of shade afforded by the leaves of the Vines. *H. Z.*

Sparmannia africana.—I was much pleased to see this useful old favourite taken notice of in your last issue, and would advise all who have a conservatory to keep somewhat respectable during the winter months to give it a trial, and I am sure they will be pleased with it beyond their expectations. It is most easy of cultivation, and is not at all particular as to soil, but a mixture of good fibry loam, leaf-soil, and well decayed manure, with an addition of some coarse sand, seems to suit its requirements as well as anything. It should have an abundance of drainage, and also an abundant supply of water at the roots, and liberal additions of liquid manure during the flowering season. It flowers profusely in 48 or 32-sized pots, but is far more effective when grown on to large specimens, say in 10 or 12-inch

pots. We have a large plant here, about 8 feet high, which has been in flower since November, and even now it seems only at its best, and as there are still a large quantity of unopened flower-buds we may reasonably expect it to flower on for the next four or five weeks. The flowers are not very serviceable in a cut state, but for associating with *Chrysanthemums* and especially *Camellias* in the adornment of a conservatory, especially a large one, during the winter months I know of a no more useful plant. *The Fraser, The Gardens, Gordon House, Isleworth, February 7.*

Mice in Gardens.—The field vole (*Arvicola agrestis*), to which allusion has been made by Mr. Dod (p. 119), has been very troublesome hereabouts during the past winter, and in spite of the almost entire absence of snow has in some instances done irreparable damage by barking shrubs, &c. In the month of November I saw what would have been a beautiful house of late *Chrysanthemums* but for these cut depredators, whose apparent liking to these plants led them to nibble almost every plant to such an extent as to render them useless. They have also a particular fancy for gnawing the hearts of Lettuce and Endive. I would recommend Mr. Dod to try the old-fashioned figure-of-four trap as a means of assisting his wensels to rid him of these tormentors. I have seen them caught in this way. A cat will sometimes do good service towards their extirpation, having seen as many as five and six dead ones on a morning lying about that had been caught during the night. *E. Morgan, The Brits, Harrow-on-the-Hill.*

Blackbirds and Slugs.—With reference to the note in your journal for February 4—"Blackbirds and Slugs"—I notice in Montague's *British Birds*, edited by Newman, that the author states:—"The blackbird's food is chiefly worms and shelled snails; these last are most dexterously broken against a stone in order to get at the animal. All kinds of insects and fruit are also eagerly sought after." In the latest edition of Virell's *British Birds*, edited by Professor Newton, the author writes:—"The food of the blackbird is considerably wider than the season. In winter it will resort to the farmyard, and vie with the sparrow in its diligent search for scattered grain and seed. In spring and early part of summer it feeds on the larvae of insects with worms and molluscs; as the season advances it exhibits a great fondness for fruit, and its constant visits to the garden are apt to bring upon it the vengeance of the short-sighted gardener. When, however, the enormous number of insects, slugs, and snails—injurious to vegetation, and eaten by the blackbirds throughout a great portion of the year—duly considered, it is pretty plain that the value of the fruit consumed during a few weeks only is counterbalanced by the services performed." In my school-days I used to keep blackbirds; their chief food was worms—I don't think I ever gave them berries or snails, but fruit, especially Cherries and Strawberries, of which they are very fond; neither have I ever noticed blackbirds eating snails; for this reason, perhaps, they are shy birds, and like shrubberies, &c. Thrushes will eat any number of snails in confinement. I have placed a snail flat stone in their cages, and the snails—the birds will seize them, knock their shells against the stone, which is soon broken, and the contents as readily devoured. I suspect blackbirds would do the same in confinement. *John Colebrook, 13, Whitby Street, Lothians Square, S. W.*

Quick Hedges.—I see in your last issue an inquiry as to whether it is right to cut down quickset at the time of planting, so as to make a good hedge. Allow me to say that from experience I do not think it desirable to do so, as the plants generally break readily if thus treated. The plan that I have adopted to answer best is to let them have one year's growth before cutting them down. Plant now, and cut them down with a sharp knife in a year's time. Keep them free from weeds, and stir the soil round them three or four times during the year, and they will break much stronger and make a good hedge in less time than those cut down when planted. *John Charlton, Stammer Vale Nursery, Tinsbridge Wells.*

Decrease of Several Kinds of Small Birds.—The effect of the three past severe winters appears to have made a marked difference in the number of small birds, both native and migratory, which usually inhabit our northern woodlands, and are so commonly seen on hedgerows, orchards, and fields around our dwellings. For a number of years previous to the winter of 1878 starlings had become very numerous all over the North, while considerable numbers remained here all the winter. At present there are none to be seen, and even through the summer months very few were to be distinguished. This is very generally regretted by farmers and others. It is very probable that the fact of their being a grub and insect feeding bird they do much good during the spring and summer months. Their common resort is about houses, farm buildings, and holes in trees during nesting time, and they are

consequently of a tame and familiar character, somewhat resembling in this respect the house sparrow. During the period of catering for their young, it is no uncommon affair to see them settled upon the backs of sheep both while grazing and lying. I believe them to be perfectly harmless in gardens. Their soft sweet notes when congregating together in the evening before roosting time were very enjoyable and interesting. The skylark is also another sort of bird that has become very much reduced in numbers; and as it is one of our sweetest native songsters, this is a subject of very general and common regret. The song thrush being a migratory bird during severe winters, is also very much lessened, and few were seen returning last spring to their usual breeding haunts. Their garden companion, the blackbird, was, however, plentiful enough through the spring and summer months. From their habits through the winter months being different, they did not become decimated to so large an extent; being evidently a bird not well adapted to take long flights, like the thrush, they remain where they are feared, and find food about ashpits, pigsties, &c. Amongst the greatest blanks, however, to our northern shores is the almost entire absence of the Norwegian fieldfare and the redwing, which used to visit us by the thousand. This winter none of the former has been seen, and very few of the latter. Bullfinches, siskens, crossbills, and most other kinds of small birds are very much reduced in numbers, and show the disastrous effects of the long protracted winters upon the feathered tribe. *F. Webster, Gordon Castle.*

Double White-flowered Auricula.—"Alpha" enquires at p. 120 if any of your readers have seen this plant in flower. I have seen it in flower several times at Ascog Hill, Bute, when that place was the summer residence of the late A. B. Stewart, Esq. I cannot say if it is there now, as most of the plants were disposed of some time ago. It is a very free-flowering plant and nicely scented, and I believe was brought from one of the large London nursery firms, but I cannot say which. *Duncan Murdoch, Stagshaw Gardens, Colridge-on-Tyne.*

A Preventive of American Blight.—A simple experiment which I have tried with my Apple trees during the last two years seems so far to have proved successful as a perfect preventive of the spread of American blight. When I took this place, some three years ago, I found that the young Apple trees were being severely injured by this pest, and the usual methods of extermination, including the application of paraffin, seemed of no avail. In the following spring I placed mounds of soot around the stems of all the trees, and from the first time this was done to the present I have seen none of the insects or their work. Knowing that the insects were accustomed to hibernate in the ground around the base of their trees it occurred to me that any medium which could be applied to prevent them from re-ascending the holes of the trees in the early spring would have the desired effect—hence this experiment. I put the soot around the stems in the first week of April each season. *William Earley.*

Winter Aconite (*Eranthis hyemalis*).—What a charming and interesting early spring flowering plant this is. While looking round Messrs. John Jeffries & Son's nursery at Cirencester the other day, I saw a line of plants aglow with its bright yellow flowers. It is very hardy, and its cultivation very simple, as it will succeed in almost any garden soil, and comes into flower earlier than almost anything else in the open ground. It should be planted in clumps or masses, and when associated with Snowdrops it is very effective. *D. E.*

Tropæolum speciosum a Hardy Perennial Climbing Shrub.—Last year I succeeded for the first time, after many failures, in getting *T. speciosum* to grow. It ran up to the top of a moribund bush of *Berberis Darwinii*, and flowered well. The stem is so breaking in itself at every joint from top to bottom, and in the leafy continues as mild as it has been hitherto, it is quite possible that the *Berberis* bush may be a mass of leaves and flowers in May or June. *H. Harpur-Creese, Drayton-Bean-hamp Rectory, Tring.*

VANDA CAITHCARTH, rather rare, and seldom seen in flower, is in bloom at present at Messrs Veitch's. The large, singular, and fleshy flowers are very distinct; the sepals and petals, pale yellow, are so thickly marked with thin transverse cinnamon-coloured lines as almost to hide the ground colour. The most singular part of the flower is the large lip, which is loosely hung, white, with two parallel purple lines, the raised margin of the lip being soft yellow.

Notices of Books.

Pflanzengeographie für Gartner und Freunde des Gartenbaues. (*Geography of Plants for Gardeners and Lovers of Gardening.*) Von Dr. E. Goetze. Svo, pp. 476. Stuttgart: Verlag von Eugen Ulmer, 1882.

This book is the seventh volume of a series of works on the different branches of gardening and subjects belonging thereto in course of publication by Ulmer, of Stuttgart. Several of the volumes have been noticed in these columns, and, as has been pointed out, they show various degrees of merit, though none of them is quite bad. The shortcomings of one or two of them are due to the writers having overtaken themselves in trying to say something new, instead of being satisfied with a careful bringing together of useful facts. Dr. Goetze does not promise anything new. As he says in a very modest preface, he has tried to pick out all that is most worth knowing from the writings of those men who have most deeply studied the subject, and to place this knowledge before the reader in a useful form. At the beginning of his book he frankly gives the sources from which he has drawn, and throughout the work he very often lets his author speak in his own words. This way of treating the subject has its drawbacks as well as its advantage, because it does not allow of that evenness and clearness that make the charm of a book written from beginning to end by one pen. It also sometimes leads to the same thing being said again in other words under another heading, and some of the facts that would naturally fall together are far apart. Nevertheless, taken as a whole, Dr. Goetze's book is a good and useful one for the persons for whom it was written. It bears signs throughout of much painstaking work in reading many of the best works on the spreading of plants over the face of the earth, and usually of a happy choice in the borrowed passages. At the same time there are traces of the author having worked without several of the newer books that would have helped him nearer to the truth in some of the numbers, in some of the findings, and in some of the sayings, as we shall presently point out. But let us first give a view of the order in which the matter is treated. The book is divided into two parts, namely, "Outlines of Plant Geography" and "Views of Vegetation." The former is broken up under the following headings:—1, History of Plants; 2, Climate and Soil; 3, Zones; 4, Physiognomy of Plants; 5, Migration of Plants; 6, Regions of Vegetation; 7, Statistics and the Distribution of the most Important Families of Plants. These chapters are split up into a number of paragraphs, each usually bearing a suitable heading. The second part, as the title shadows forth, is made up of a number of pictures of plant life in various parts of the world.

Let us look a little into the chapter on climate and soil, and show the reason why we do not always like the headings. In the middle, at the end of the part dealing with the weather, and under the heading, "Zones of Changeable Winds and Rains," we are all at once brought face to face with the definitions of De Candolle's physiological groups of plants, as extended by Baker, followed by the distribution of the groups. This matter seems quite out of place here; and it would have been better to have made another chapter of it. Before leaving this part we may be allowed to point out a mistake the author has made in saying that the four physiological groups, Macrotherms, Mesotherms, Mesotherms, and Microtherms might be more roughly divided into Philo-therms and Frigofuges, or heat-lovers and cold-fearers. This has arisen from misunderstanding the sense in which Mr. Baker used these terms in some lessons on plant distribution, which were first given in the *Gardeners' Chronicle*, and afterwards printed

apart. Mr. Baker, not very happily, perhaps, used the names heat-lovers and cold-fearers for two kinds of plants, one kind of which is "checked from spreading from warmer latitudes by the want of plenty of heat in summer to carry them from the seed stage, round the circle of life, to the seed stage again; and the other, for which the heat of summer is sufficient, are cut off by sudden fits of cold that catch them at a time of vegetative activity." In a few words it may be said that Baker's heat-lovers are the annual plants that reach high latitudes in continental climates, whilst the cold-fearers are trees and bushes, especially evergreens, that reach relatively high latitudes in insular climates.

Further fault might be found with some things in the plan of the book, but as we do not wish to judge it by its weak points alone, we will leave off fault-finding as soon as we have shown two or three cases in which the latest knowledge would have spared the author some blunders. Thus, in speaking of the plants of St. Helena, *Pelargonium coteyledonis* is given as a noteworthy example of a plant that has died out; whereas Melliss, in his work on the natural history of the island, names several places in which it still grows. Then, as to the flora of Madagascar, it is wrong to say that it differs as widely from that of Africa as does the flora of Australia from that of Asia; and it is likewise wrong to say that the plants of the centre of the island are almost wholly unknown. The flora of Madagascar is now known to be closely akin to that of Africa, and it is just the central hill part of which the plants are best known. The plants of the hills have their nearest kinship in South Africa and in the mountains of Tropical Africa.

Now we will turn to the flora of New Zealand. Dr. Goetze rightly says that the new plants found since the publication of Sir J. Hooker's essay, in 1853, do not alter the main character of the flora; but he is wrong in saying that the numbers of genera and species have not been greatly raised. Taking the Composite, the number of species has risen from ninety to 140, with several new genera; and the Scrophulariaceæ have risen from forty to sixty species, whereof fifteen are new species of Veronica. Then there are nine new species of Ranunculaceæ, amongst them the strange ones with peltate leaves; and six new species of Ligusticum.

One more fault we find—one common to so many German books, is the want of an index. A book of this kind without an index is like a clock-face without pointers.

At last we pass on to the more pleasing task of taking something in return for what we have given. Dr. Goetze was so fortunate as to get a sketch of the vegetation of Australia from the pen of Baron Mueller; and as this is newer than anything else we will close our notice of the book with a few gleanings therefrom. "The total number of hitherto described and accepted species of Australian plants amounts to about 11,500. The number of Dicotyledons is about 7000; of Monocotyledons nearly 1550; and of Acotyledons nearly 3000." The last number is the least near the actual number existing, as it does not include the Desmids and Diatoms; and the moulds and other fungi have yet to be thoroughly worked up. Below are the numbers of species of the orders of flowering plants most largely represented:—Leguminosæ, 1043; Myrtaceæ, 956; Proteaceæ, 586; Composite, 537; Cyperaceæ, 373; Gramineæ, 304; Euphorbiæ, 295; Orchidæ, 248; Euphorbiaceæ, 220; Goodeniaceæ, 209; Rutaceæ, 203; Rubiaceæ, 134; Labiata, 130; Sterculiaceæ, 117; Salsolaceæ, 116; Liliaceæ, 113; Malvaceæ, 105; Scrophulariaceæ, 103; Sapindaceæ, 101; Umbellifereæ, 100; Amarantaceæ, 96; Dilleniaceæ, 95; Rhamnaceæ, 95; Stylidiaceæ, 95; Amaryllidæ, 87; Verbenaceæ, 79; Thymelææ, 74; Convolvulaceæ, 71; Kestiacæ, 71; Juncæ, 66. Of Alge about 1050 have been found, and 203 Ferns. In regard both to numbers and peculiarity the flora of South-western Australia is the richest. There the beautiful Myrtaceæ genera *Darwinia*, *Verticordia*, *Calycothrix*, *Thryptomena*, *Beekea*, *Beaufortia*, *Calothamnus*, *Callistemon*, *Melauclea*, and other genera have their greatest concentration of species. The genus *Acacia* counts nearly 500 species, and is the richest in all Australia, and the south-west is peculiarly rich in species. Herbs with brilliantly coloured flowers are also very numerous, and many of them are very lovely. The genera *Goodenia*, *Leschenaultia*, *Dampiera*, *Scèveola*, *Anigozanthus*, *Calectasia*, *Drosera*, *Utricularia*, and various genera of terrestrial Orchids, enter largely

into the composition of the herbaceous element. Another noteworthy feature of the vegetation is the wonderful variety of pretty annual plants of the smallest size and belonging to a number of different families. Then comes a grand array of the everlasting Composite, especially species of *Helichrysum*, and *Heliotropium*, and including the lovely *H.* (*Rhodanthe*) *Manglesii*, *Helichrysum Cassinianum*, and *H.* *Lawrencella*. Further, innumerable Leguminosæ and Proteaceæ. The absence of Palms and Tree Ferns is compensated for in some degree by the abundance of *Eucephalartos Fraseri*, *Kingia australis*, *Nantborthea Preissii*, &c. Grasses are largely replaced by sedges and Restiaceæ. There is not space here to follow the author through the other regions—the vegetation of the almost rainless interior, of the more humid south-east, of the delectable island of Tasmania, and of Tropical Australia, yet it is most instructive reading.

The Rosarian's Year Book for 1882. Demrose.

"This little messenger of loyalty and goodwill," as the Editor terms it, opens with an excellent portrait of the Hon. and Rev. J. T. Boscawen, and a slight account of the garden at Lamoran, omitting, however, mention of the full-page illustration, from a water-colour sketch of Mrs. Boscawen, that appeared in our columns, and the descriptive notes on the *Rhododendrons* by Mr. Mangles. Among the other articles are one on the "Enemies of the Rose," by Mr. Eaker; a similar one on "Rose Grubs," by Mr. Hlawtrey; on "Garden Roses," by Mr. Ewing; numerous gossiping articles of an ephemeral character, and, what is always the *finis de resistance* of this year-book, and which will give it permanent value, the account of the weather of the Rose year and its influence on the growth of the Rose, by Mr. Mawley. We note that during the terrible January of 1881 the lowest temperature of the soil at 1 foot in depth was 33°. Contrast this with the lowest temperature on the grassed surface—6°.3, more than 38° of frost!

—*Rabenher's Kryptogamen Flora*—The fifth and sixth parts of this useful publication contain the further account of the *Lymenocoetl* genus. The descriptive matter is in German, with clear woodcuts illustrative of the genera. In the present part, among others, is given a figure of the *Exobasidium* which causes gall-like deformities on the stems and leaves of *Vaccinium* and other Ericaceæ plants, and which we once saw overrunning a whole quarter of *Rhododendron hirsutum* and *R. ferrugineum*.

—*The Journal of Forestry* for the current month opens with an interesting article on the Forest of Dean, a practical article on Profitable Planting, and a variety of miscellaneous matter of value and interest.

—*Practical Microscopy.* By G. E. Davies (Bogue).—This is a work that will be warmly welcomed by microscopists, as it contains within moderate compass full details of the construction of the instrument in all its varied forms, and, what is of more use to the student, hints for dissection and the preparation of objects, their examination, measurement, &c. We can hardly recommend the busy student, already overlaid with work, to busy himself with the mounting of objects, except so far as may be absolutely necessary. Many things in connection with microscopy have become so technical, and demand so great an expenditure of time that it is better for the student to turn to professional assistance rather than to his own efforts, unless, indeed, in special cases. But whether the student take up this volume simply for the information it will give him in any particular line of research, or whether he refer to it with the view of becoming a specialist, in either case he will find it of very great service to him. We do not know any work of its class so comprehensive.

COLONIAL NOTE.

JAMAICA.—We have received a copy of Mr. Morris' lecture on the growth, for commercial purposes, of Coffee and Cinchona in the island. We have so often referred to the subject that we need here only commend the spirit which has led to the delivery and publication of this lecture, which can hardly fail to prove serviceable to the community.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 8, 1882

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygrometrical Deductions from Glaisher's Tables, WIND, RAINFALL. Rows for Feb. 2-8 and a Mean row.

- Feb. 2.—A fine day, but cold, foggy, and frosty. Fine but cloudy night.
3.—A dull, cloudy, damp, foggy day. Dense fog at night.
4.—An unusually dense fog all day.
5.—A dull, overcast, cold day and night.
6.—A dull, damp, foggy morning. Fine overcast night, but no mist.
7.—A dull, damp, foggy day; dark sky. Fine calm night.
8.—A dull, damp, gloomy day; calm. Fine, partially clear night, but cold.

LONDON: Atmospheric Pressure.—During the week ending February 4, the reading of the barometer at the level of the sea decreased from 30.28 inches at the beginning of the week to 30.03 inches by 3 P.M. on the 29th, increased to 30.65 inches by 9 A.M. on the 31st, decreased to 30.64 inches by 3 P.M., and increased to 30.70 inches by midnight of the same day, decreased to 30.54 inches by 9 A.M. on February 2, increased to 30.63 inches by 9 A.M. on the 3d, decreased to 30.55 inches by midnight of the same day, and was 30.46 inches at the end of the week.

The mean reading for the week at the level of the sea was 30.49 inches, being 0.05 inch lower than last week, and 0.54 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 47°, on January 29th. On February 4 the temperature did not rise above 34°.5. The mean of the seven high day temperatures was 40°.6.

The lowest temperature in the week was 26°, on February 2; on January 29 the lowest temperature was 42°. The mean of the seven lowest temperatures was 33°.1.

The greatest range of temperature in one day was 14°, on February 3; the smallest was 3°, on January 31. The mean of the seven daily ranges was 7°.5. The mean temperatures were on January 29, 44°.2; on the 30th, 41°.4; on the 31st, 39°; on February 1, 33°; on the 2d, 32°; on the 3d, 35°; on the 4th, 31°.6; Of these the 29th, 30th, and 31st of January were 5°.8, 3°, and 0°.5 above their averages respectively; and those of the 1st, 2d, 3d, and 4th were 5°.6, 6°.7, 3°.8, and 7°.3 below their averages respectively.

The mean temperature of the air for the week was 36°.6, being 0°.4 higher than last week, and 2° lower than the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 100°, on February 1; the highest, on the 4th, was 37°.5. The mean of the seven readings was 57°.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 19°, on the 2d. The mean of the seven readings was 28°.7.

Rain.—Rain fell on one day to the amount of 0.02 inch. Fog was prevalent on February 2, 3, and 4; on Saturday, the 4th, it was present all the day, and of a very unmassive dense character.

ENGLAND: Temperature.—During the week ending February 7, the highest temperatures were 54° at Plymouth, 53° at Truro, and 51°.5 at Bristol. The highest temperature at Hull was 45°, at Bradford 46°, and at Blackheath, Leeds, and Sunderland, 47°. The general mean was 48°.8.

The lowest temperatures in the week were 20°.9 at Cambridge, 25° at Leeds, and 25°.5 at Wolverhampton. The lowest temperature at Plymouth was 37°.6, at Truro 32°, and Brighton 30°.6. The general mean was 28°.1.

The greatest ranges of temperature in the week were 27°.1 at Cambridge, and 22°.5 at Nottingham and Sheffield. The least ranges were 16°.4 at Plymouth, 17° at Sunderland, and 18° at Hull. The general mean was 20°.5.

The mean of the seven high day temperatures was highest at Truro, 50° at Plymouth 49°.7, and at Sunderland 45°.8; and was lowest at Blackheath, 40°.6, at Hull 41°.1, and at Bradford 41°.2. The general mean was 43°.8.

The mean of the seven low night temperatures was highest at Truro, 40°.6, at Plymouth 40°.2, and at Brighton 36°.2; and was lowest at Cambridge, 31°.6, and at Sheffield and Hull, 32°.1. The general mean was 34°.5.

The mean daily range was greatest at Cambridge and Sunderland, 11°.1, at Bristol 10°.5, and was smallest at Brighton and Blackheath 7°.5. The general mean was 9°.3.

The mean temperature for the week was highest at Truro, 45°, and at Plymouth, 44°.7; and was lowest at Hull, 36°.3, at Blackheath 36°.6, and at Cambridge 36°.8. The general mean was 38°.8.

Rain.—The largest falls were 1.99 inch at Sheffield, 1.57 inch at Leeds, and 1°.38 inch at Nottingham. The least falls were 0.02 inch at Blackheath, 0°.12 inch at Brighton, and 0°.13 inch at Sunderland. The general mean was 0.68 inch. It fell on an average two days in the week. Snow was falling all day on Jan. 29 at Bradford, providing water to the depth of 1.05 inch.

SCOTLAND: Temperature.—During the week ending February 4 the highest temperature was 53°.2, at Aberdeen; at Leith the highest temperature was 45°. The general mean was 49°.1.

The lowest temperature in the week was 28°, at Glasgow, Dundee, and Paisley; at Edinburgh the lowest temperature was 31°.4. The general mean was 29°.3.

The mean temperature for the week was highest at Aberdeen, 40°; and lowest at Dundee, Greenock, and Leith, 38°.6. The general mean was 39°.3.

Rain.—The largest fall was 0.75 inch, at Greenock, and the smallest 0.12 inch, at Aberdeen. The general average fall was 0.33 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—BACON.
DECAURNEA RECURVATA.—Can this plant be propagated by taking off the top, as one would a Dracena? And if it will root as a cutting, will the plant then make a bulb, as in old specimens, or grow without forming the latter? [We have no knowledge gained by actual experience to offer our correspondent, but do very much doubt the plant doing as he desires. Ed.] If the top was taken off, would the stem make another head, or would it die? [Die, we should think. Ed.] 7. C.

SABOTA.—They are selling a vegetable here called "Sabota." What is this? H. E. C. Liverpool. [The fruits of Sapota accharis, the Sapodilla Plum of the West Indies. Ed.]

Answers to Correspondents.

DENDROBIUM NOBILE, &c. Samsou. Return the plants to the stove to make their growths. Keep the Orchid in the stove, but when growth is completed keep them a little drier at the roots.

FLORIST'S FLOWERS FOR JULY: G. B. enquires, "What would be the best eight species of florists' flowers to show for cut blooms early in July?" Eight species of hardy florists' flowers cannot be had in flower at that time. Probably eight distinct hardy herbaceous plants are attainable; e.g. so, Achillea Millefolium, rosas, Petalipigia chrysantha, A. carnata, Campanula persicifolia alba pleno, Delphinium Madame H. Jacot, Pyrethrum Sir C. Nares, Stenactis speciosa, hybrid Potentilla Louis Van Houtte.

GRAFTING CAMELLIAS: An Amateur, Mr. William Paul, who has had great experience with Camellias, states that the autumn is considered the best time to graft, but it may be done any time between August and February. See his paper on this subject in our number for April 26, 1879.

GREENHOUSE CLEMATIS: Clematis. The varieties of the patens group would be most suitable for your greenhouse, as they bloom early, when flowers are more particularly prized. There is no reason why they should not succeed if planted outside, as they are hardy, but it would be wise, for several reasons, to neatly protect the exposed portion of the stems. They require deep and well-enriched loamy soil; and the summer shoots, which may be encouraged to grow and ripen outside, should be trained to their full length, and might be taken inside to bloom in the following spring, the older ones being cut away, if necessary, to make room for them. A useful selection would consist of the following sorts:—Miss Bateman, white; Fair Rosamond, bluish-white; Mrs. S. C. Baker, white with red bars; Sir Garnet Wolseley, blue with red bars; Lord Derby, silver-grey; Stella, light violet

Natural History.

THE HOUSE SPARROW.—I am surprised that so keen an observer as I know Mr. P. Grieve to be should not have found out what a deprecator the house-sparrow is in gardens, and how voracious is his appetite for the buds of Goseberry and Currant bushes, on which he feeds in early spring till the branches of the trees are often stripped bare. I have witnessed this repeatedly, and know him to be a loafing, worthless fellow, always on the look-out for scraps, and seldom or never rendering any service to man for the robbery he commits in the cornfields and around stacks and farm-buildings, where he is one of the worst pests the farmer has to contend with. If Crows were his only fancy in gardens we might tolerate him; but, besides these and the Gosecherry-buds, he has a special liking for Peas; for immediately these are through the ground he is at the tops, and when in pod he has a quick and ready method of finding his way through the shells, and extracting the succulent morsels within. To think of scaring such a bold marauder is quite out of the question, and powder and shot, or doctored Wheat, are the only means of waging a successful war against him. Had man sparrows are in this country, I hear they are quite a scourge in Australia, where, like the Scotchman's Thistle, they have increased and multiplied at such a rate as to threaten to devour everything in the way of cereals that favoured colony produces. In most counties of England boys were at one time paid for destroying the nests of sparrows, or had so much per dozen for their eggs and young; but an unwise law (as I think) has stopped this, and also the sale of poisoned Wheat, if it is known to be wanted for the purpose of laying as a deadly bait for the sparrows. As they breed so fast something will have to be done ere many years to diminish their numbers, as farmers cannot afford to have crops eaten up by birds that make no return for their keep. Some aver that they pick up and consume insects, but as well might it be said that carnivorous animals eat grass—as, indeed, the dog does occasionally, by way of medicine—and sparrows may perhaps be guided by the same kind of instinct to take a grub or caterpillar as an aperient. 7. Sheppard.

BLACKBIRDS AND SLUGS.—Having for some years past given the blackbird the credit of eating slugs, I have been rather startled by the recent statements to the contrary. On referring to Mr. Groom Napier's Food, Use, and Beauty of British Birds—a little work which I think every gardener and farmer should possess—I find that careful observer mentions slugs as forming part of the blackbird's food during several months of the year. My mind also reverted to an animated controversy on the food of birds carried on in your columns some thirty years since by the late Mr. Doubleday, of Epping, and others, and turning to the volume for 1850, p. 118, I found the following quotation from Yarrell by a correspondent:—"When, however, the enormous number of insects and their larvæ, with the abundance of slugs and snails, all injurious to vegetation, which are eaten by blackbirds throughout a greater portion of the year, are duly considered, it may fairly be doubted whether the value of the fruit is not counterbalanced by services rendered." So much for the authorities. Wishing to prove the point myself, and knowing the whereabouts of a tame blackbird, I took it a few days since a present of six slugs, which it devoured in about as many seconds, not by any means as a "nasty dose," but with evident relish. A. G. Briteman, Thames Bank, Marlow.

SATTLER and BETHEGE, Decorative and Wholesale Gardeners, Queidlinburg-a-H., Germany.

NEW BROCCOLI—"LEDSHAM'S LATEST OF ALL."

WAITE, NASH,
HUGGINS & CO.

Have much pleasure in introducing this splendid Novelty, the whole stock of which has been purchased by them from the Raiser,

Mr. SAMUEL LEDSHAM, Chester.

The above illustration (taken from a Photograph) gives a fair idea of its form and size; but the necessary removal of the leaves for the purpose of photographing prevents its true character, as THE BEST SELF-PROTECTING VARIETY extant being shown. As the Testimonials appended will show, this is the "LATEST OF ALL" Broccolis, lasting well until the time that the early Cauliflowers are ready. Its robust constitution enables it to withstand the most severe winters; while the mass of leaves by which it is protected prevents the heads from being injured by the summer sun. This variety has been famous in the neighbourhood of Chester for several years, and it is now with the greatest confidence offered for the first time to the general trade.

THE FOLLOWING TESTIMONIALS SPEAK FOR THEMSELVES:—

Extract from a Letter from Mr. LEWIS SOLOMON, Centre Row, Covent Garden.
"May 14.—Your Broccoli came safely to hand this morning. I have shown it to several good judges. They say, without exception, *they are the finest they have seen.* I have also been to one of the Committee of the Royal Horticultural Society, who also says *they are the very best.* If you have fifty dozen ready now we could dispose of them for you."

Extract from Letters from A. F. BARRON, Esq., Royal Horticultural Society's Gardens, Chiswick.
"June 2, 1880.—After the Committee disposed of the examples of 'Cattell's' Eclipse arrived, and were compared with yours by myself and several others, and *found to be quite distinct.*"
"June 23.—I brought forward yesterday the subject of your 'Broccoli.' The Committee *commented it highly as a very excellent sort.*"
"October 17, 1881.—The Committee considered the Broccoli to be a very fine late white variety."

Extract from the GARDENERS' CHRONICLE.
"May 15, 1883.—Mr. Ledsham, Green Lane, Tarvin Road, Chester, sent examples of a very promising variety of late Broccoli. The heads range from small to medium size, the *best* of a first-class Broccoli in size, shape, and whiteness, and, as we can affirm, of very delicate flavour."

Extract from the GARDENERS' CHRONICLE.
"May 27.—Mr. S. Ledsham again sent a fine sample of his late white Broccoli, which, considering the winter the plants have passed through, and their fine quality as shown, is a variety of great merit."

Extracts from JOURNAL OF HORTICULTURE.
"May 15, 1880.—We have received from Mr. Samuel Ledsham, Market Gardener, Boughton, Chester, some heads of late Broccoli of considerable merit. The heads are extremely solid, and almost as white as early Cauliflowers. They are not large, but quite large enough for the heaviest for their size we have noticed. Their whiteness is due to the marked self-protecting character of the variety, the heads being deep down in the plant and closely enveloped with leaves, these not having the twisted form of the Knight's protecting type. This Broccoli is a very good one, and if of dwarf habit and hardy it will prove highly worthy of cultivation, especially if, as we are informed, it will continue producing heads for three or four weeks longer."

"May 27.—We have received further specimens from Mr. Ledsham, Green Lane, Tarvin Road, Chester, of his late protecting Broccoli. The heads are larger than those referred to on p. 374, and are close, white, heavy, and of excellent quality."

Sold only in Sealed Packets. Price 2s. 6d.

May be obtained from all Nurserymen and Seedsmen throughout the Kingdom, and from

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

CATTLEYA LABIATA PERCVALIANA

(Rchb. f.)

TRUE AUTUMN-FLOWERING LABIATA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by Order of Mr. F. SANDER, on THURSDAY, February 23, a wonderful Importation of this magnificent CATTLEYA. It is well known there are numerous varieties among the old Cattleya labiata, such as PESCATOREI, PICTA, &c., and the varied Bulbs show that many varieties are among the lots offered. It is true Autumn-flowering. Flowers will be on view of this the finest Brazilian CATTLEYA: sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed, lower part deep velvety-purple; in some varieties quite one half of the lip is dark; throat golden-yellow. We have never previously seen imported a Cattleya so floriferous: there is hardly a Bulb which has not flowered, and whose spike does not show three and four flower seats. Mr. Seidl, the lucky discoverer, states that one mass alone had 380 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importation, which is altogether in simply superb condition. The whole will be given into Mr. Stevens' hands, and comprise all that could be found, and none sold privately; but Mr. Sander earnestly invites prior inspection at the St. Alban's Nurseries, which are easily reached by the Midland, London and North-Western, or Great Northern Railways, from any of the Metropolitan Stations, Liverpool Street, King's Cross, or from St. Pancras, by fast train in half an hour.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

ASPARAGUS.—The finest roots that money can procure, 2s. 6d. per 100. This delicious vegetable does not require half the expense usually incurred. For directions for planting, see SEED LIST, free on application. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

Gardenia intermedia.

MESSRS. JOHN STANDISH AND CO. have to offer a very extensive stock of GARDENIA INTERMEDIA of all sizes, every plant being in the most robust health, and guaranteed perfectly clean. Six plants in 6-inch pots at 2s. 6d. each; larger, 3s. 6d. to 10s. 6d. each. Specimens, fine bushy plants, with plenty of bloom-bud on them, 1, 15s. 2 and 3 guineas each. Royal Nurseries, Ascot, Berks.

GAME or COVERT PLANTING.

GORSE, two years in drills, 5s. per 100. SNOWBERRIES, stone, 2 to 3 1/2 feet, 25s. per 1000. THOMAS FERKINS AND SON, 34, Drapery, Northampton.

CEDRUS DEODARA — "The Indian Cedar" — Beautiful specimen trees, frequently planted and well-rooted, offered at the undermentioned low prices to effect a clearance:— 5 to 6 feet, 48s. per dozen | 7 to 8 feet, 72s. per dozen 6 to 7 feet, 60s. per dozen | 10 to 12 feet, 54s. per dozen

ABIES DOUGLASHI.—One of the most noble trees grown, well-rooted specimens:— 6 to 7 feet, 3s. 6d. each; 30s. per dozen 7 to 8 feet, 4s. 6d. each; 42s. per dozen 8 to 9 feet, 5s. 6d. each; 60s. per dozen

The above-named trees are highly suitable for Avenues, Lawns, Shrubberies, or Woods, and the opportunity of purchasing on such terms rarely occurs. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

Hardy Rhododendrons and Azaleas. ANTHONY WATERER has to offer many thousands of healthy well furnished and well budded RHODOENDRONS of the best and most popular kinds. Hardy AZALEAS, a selection of the most beautiful kinds known, all well furnished and well budded, many thousands.

AZALEA MOLLIS, seedlings and best named varieties, covered with buds, many thousands. Knap Hill Nursery, Woking, Surrey.

WEBB'S PRIZE COB and other FILBERT TREES, Calot Gardens, near Reading. Apply to Mr. COOPER, F. KILLS, Calot Gardens, near Reading, Berks.

STOCK PLANTS of VERBENAS.—We have ready at the present time a large stock of the above, which for vigor and freedom from disease cannot be surpassed; they are very bushy, and bear already large quantities of clean healthy cutting. Price 16s. per 100, or 140s. per 1000. LIST of sorts may be had on application to: KEYSER, 320, C1, Nurseries, Salisbury.

THE EARLIEST WRINKLED PEA.

AMERICAN WONDER.

This valuable new early dwarf Wrinkled Pea was introduced by us last season. It is as early as our Kingleader, which is still the farthest Round White Pea. The haulm is thickly covered with fine pods, each containing from seven to ten Peas of delicious flavour. Height, 10 to 12 inches.

From Mr. T. TUSTON, *Gt. to* John Hargreaves, Esq.
 "American Wonder" Pea proved most satisfactory; was sown the last week in February, and was fit for the use the first week in June—quite as early as "Kingleader," sown the first week in January, and it is superior in quality; especially valuable for growing on borders where the trees are a consideration."

From Mr. T. LOCKIE, *Gt. to* the Right Hon. Lord O. Fitzgerald.
 "American Wonder" is exceedingly useful for forcing; only 10 inches high; producing a good crop of fine large Peas, of excellent flavour. Sown in a cold frame, March 10, was ready for use May 10. For forcing it is far superior to "Little Gem" or "Tom Thumb."

Price, 5s. per Quart; 2s. 6d. per Pint.

THE QUEEN'S SEEDSMEN, *Heston, Slough,* READING, BERKS.

- ASPARAGUS—extra fine, strong planting roots, 2s. 6d. to 3s. 6d. per 100, 20s. to 30s. per 1000.
- HERBS of many kinds, 3s. to 6s. per dozen.
- PLUM (Prunus)—Variegated, common (P. domestica variegata), a very striking and easily grown variegated tree, 2 to 4 feet, 9s. per dozen; 3 to 4 feet, 12s. per dozen.
- ELM—Wych, transplanted, 4 to 6 feet, 8s. per 100, 6s. per 1000; 6 to 8 feet, 25s. per 100, 200s. per 1000.
- POPLAR—Black Italian, 6 to 8 feet, 5s. per dozen, 20s. per 100, 160s. per 1000; 8 to 10 feet, 5s. per dozen, 30s. per 100, 240s. per 1000.
- WILLOW—Beiford or Huntingdon, 6 to 8 feet, 3s. per dozen, 15s. per 100; 8 to 10 feet, 4s. per dozen, 25s. per 100; 10 to 12 feet, 6s. per dozen.
- .. Cut-leaved, 6 to 8 feet, 3s. per dozen, 15s. per 100; 8 to 10 feet, 4s. per dozen, 25s. per 100; 10 to 12 feet, 6s. per dozen.
- ASH—(Fraxinus excelsior) latifolia, 10 to 4 feet, 12s. per dozen; aucubifolia, 4 to 6 feet, 12s. per dozen; 6 to 8 feet, 15s. per dozen; 8 to 10 feet, 24s. per dozen.
- .. spectabilis, an exceedingly fine Ash, which grows with extraordinary vigour, 3 to 4 feet, 6s. per dozen; 4 to 6 feet, 9s. per dozen; 6 to 8 feet, 12s. per dozen; 8 to 10 feet, 24s. per dozen.
- BEECH—Crested-leaved, a very ornamental tree, 4 to 5 feet, 9s. per dozen; 5 to 6 feet, 12s. per dozen; 6 to 8 feet, 24s. per dozen.
- .. Cut-leaved, very beautiful, 4 to 5 feet, 12s. per dozen; 5 to 6 feet, 18s. per dozen; 6 to 8 feet, 24s. per dozen; 8 to 10 feet, 36s. per dozen.
- .. Fern-leaved, one of the most beautiful small trees grown, 3 to 4 feet, 12s. per dozen; 4 to 5 feet, 18s. per dozen; 5 to 6 feet, 24s. per dozen.
- .. Purple-leaved, the best dark broad-leaved variety, 3 to 4 feet, 9s. per dozen, 60s. per 100; 4 to 5 feet, 12s. per dozen, 75s. per 100; 5 to 6 feet, 15s. per dozen, 100s. per 100; 6 to 8 feet, 24s. per dozen.
- .. Weeping, 4 to 5 feet, 12s. per dozen; 5 to 6 feet, 18s. per dozen; 6 to 8 feet, 24s. per dozen.
- HORSE-CHESTNUT—Extra transplanted, very fine, well-rooted trees, 8 to 10 feet, 9s. per dozen, 60s. per 100; 10 to 12 feet, 12s. per dozen, 75s. per 100.
- .. Scarlet-flowered, 6 to 8 feet, 15s. per dozen; 8 to 10 feet, 24s. per dozen.
- ELM—Variegated Weeping, fine Standards, 5 to 8 feet in stem, 24s. per dozen.
- .. Giant or Huntingdon (macrophyllus), 10 to 12 feet, 12s. per dozen, 75s. per 100; 12 to 15 feet, 18s. per dozen.
- .. Silver Variegated, 4 to 5 feet, 12s. per dozen; 5 to 6 feet, 18s. per dozen; 6 to 8 feet, 24s. per dozen.
- .. Scamptons Weeping, the finest Weeping Elm, fine straight stems and good heads, 10 to 12 feet, 24s. per dozen; 12 to 15 feet, 36s. per dozen.
- MAPLE, Norway (Acer platanoides), 5 to 10 feet, 9s. per dozen, 60s. per 100; 10 to 12 feet, 12s. per dozen.
- WILLOW—Scarlet Palm, a Willow of extraordinary vigour. The bark of the young wood is of a deep purplish-red in winter, and it bears "lamb's tails" in spring of very large size. 4 to 6 feet, 3s. per dozen, 16s. per 100; 6 to 8 feet, 4s. per dozen, 20s. per 100; 8 to 10 feet, 6s. per dozen, 40s. per 100; 10 to 12 feet, 12s. per dozen.
- EUONYMUS—radiatus argenteus variegatus, a very useful plant for edges to winter beds, 3 to 4 in., 2s. per doz., 12s. per 100; 4 to 6 in., 3s. per doz., 16s. per 100.
- ELDER—(Sambucus nigra) variegated; a beautifully variegated plant, which thrives close up to the sea; 6s. per dozen, 40s. per 100.
- .. Cut-leaved—a handsome lacinated form, and like other Elders, extremely useful for ornamental planting close to the sea. 6s. per doz., 40s. per 100.

THE GENERAL AUTUMN LIST

will be forwarded Gratis and Post-free to all applicants.

N.B. Post-office Orders should be made payable to EWING AND CO., at Eaton, near Norwich. Cheques crossed GURNEY AND CO., Norwich.

Trade Terms on application.

THURSDAY NEXT.**CATTLEYA LABIATA PERCIVALIANA**

(Rehb. f.)

TRUE AUTUMN-FLOWERING LABIATA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. SANDER, on THURSDAY NEXT, February 23, at half-past 12 o'Clock precisely,

A WONDERFUL IMPORTATION OF THIS MAGNIFICENT CATTLEYA.

It is well-known there are numerous varieties among the old *Cattleya labiata*, such as *PESCATOREI*, *PICTA*, &c., and the varied Bulbs show that many varieties are among the lots offered. It is true Autumn-flowering. Flowers will be on view of this the finest Brazilian *CATTLEYA*—sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed, lower part deep velvety-purple: in some varieties quite one-half of the lip is dark; throat golden-yellow. We have never previously seen imported a *Cattleya* so floriferous: there is hardly a Bulb which has not flowered, and whose spike does not show three and four flower-seats. Mr. Seidl, the lucky discoverer, states that one mass alone had 380 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far-distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importation, which altogether is in simply superb condition.

CYPRIPEDIUM SPICERIANUM,

A few unsold lots of our last week's sale.

MASDEVALLIA RADIOSA—very rare **ODONTOGLOSSUM ALEXANDRÆ**
and fine
ODONTOGLOSSUM NEBULOSUM " **MADRENSE**
" **CRYSTALLINUM** " **VEXILLARIUM**

CATTLEYA DOWIANA—very splendid lot.*May be viewed morning of Sale, and Catalogues had.*

WILLIAMS' FLORAL NOVELTIES

1882.

POST-FREE.

The favourite genus CALCEOLARIA, which belongs to the Natural Order Scrofulariaceae, was originally introduced to this country from Chili and Peru, since which time it has undergone vast improvements, especially the herbaceous varieties, which now make such a brilliant and pleasing display in our flower gardens. The strain of this charming plant which I offer has been grown for me by one of the most successful Prize-takers in the Kingdom, and it never fails to give satisfaction to all who cultivate it. I have received numerous testimonials from all quarters of the globe in praise of its superior merits.

- CALCEOLARIA, Herbaceous, Williams' Superior Strain .. 12. 0/ and 2. 0/
- CALCEOLARIA, Shrubby, useful for bedding purposes .. 2. 0/
- CAPSICUM, Williams' Little Gem (new) .. 1. 0/
- Awarded a First-class Certificate of Merit.
- COCKSCOMB, Williams' Prize Strain .. 1. 0/
- Never fails to take First Prizes wherever exhibited.

- DAHLIA, Single, Choice Mixed .. 1. 0/
 - DAHLIA, Double, Splendid Mixed Show varieties .. 1. 0/
- The seed of the above Dahlias has been grown by one of the oldest and most celebrated Dahlia growers in the Kingdom, and is the result of careful hybridisation of his Prize Plants, which may be expected to produce entirely new varieties.
- The Single Dahlia, if sown in heat, in February, and submitted to the usual cultural treatment, will bloom the following autumn.

SUPERB STRAIN OF PRIMULAS.
CHOICE VEGETABLE SEEDS.

UPPER HOLLOWAY, LONDON, N.

EVERY GARDEN SHOULD BE PLANTED WITH

SUTTONS' READING HERO POTATO.

Practically Disease-proof and a Marvellous Cropper.

From Mr. R. GARLICK, *Cottage, Malmesbury.*
"I have been reading the testimonials of your Reading Hero Potato, and write to tell you that I have beaten them all. From the 14 lb. I had of you last spring, I dug at the end of September the extraordinary weight of 840 lb."

14 lb. produced 840 lb.

From P. S. GRAY, *Esq., Ketho.*
"The Reading Hero was a large crop with me, free from disease and splendid in quality, bush as to looks and boiling. I think they are the coming Potato for the main crop." From the 6 cwt. I have about 5 tons."

6 cwt. produced 5 tons.

From Mr. J. H. COLLETT, *Sevoage Farm, Bedford.*
"The 2 cwt. of Reading Hero Potato I purchased from you last spring produced 3 tons 3 cwt. of sound tubers of first rate quality, and excellent shape. It is quite as heavy a cropper as the Magnum Bonum, and I think will be an equally good disease-resister."

2 cwt. produced 3 tons 3 cwt.

Prices and full particulars post-free on application.

THE Gardeners' Chronicle.

SATURDAY, FEBRUARY 18, 1882.

JOSEPH DECAISNE.

SINCE the death of Adolphe Brongniart French botany has not experienced so severe a loss as that to which it has lately been subjected by the death of this distinguished man. Decaisne, too, has claims on the horticultural world, as having risen from the position of a simple gardener to be the leading botanist in France, President of the Academy of Sciences, and Director of the Jardin des Plantes at Paris, and as having been the author of the finest, most carefully executed, and richly illustrated work on pomology that exists, as well as of various books on popular horticulture and botany, and of a whole series of articles on garden plants or groups of plants dispersed through the pages of the gardening periodicals. For these reasons some short account of his career will be acceptable to many of our readers, though the quiet, unobtrusive life of a hardworking man of science is destitute of those stirring incidents and sympathetic features which appeal to the public at large. Decaisne, though domiciled in Paris for very many years, was a Belgian by birth, having been born in Brussels in 1809. M. E. Morren tells us how his father, Charles Morren, was the schoolfellow and playmate of Decaisne, and how—as has been so often the case—the lad's first steps in the path of natural history were taken in the pursuit of butterflies.

In any case both turned their attention to botany. The earliest publication of Decaisne of which we find any record is dated in 1831, and a few years later another memoir on certain Japanese plants was written in association with his old playmate. Decaisne became attached to the Museum of Natural History in Paris, at first in the capacity of gardener, but he was soon appointed one of the assistant naturalists (1840), and we know him to have been the pupil and friend of Adrien de Jussieu and that he succeeded Mirbel as *Professeur de Culture* and Director of the garden. In this capacity he published many memoirs, to some of which we must allude at greater length, and specially he published that magnificent series of coloured illustrations of fruits and descriptive text known as *Le Jardin Fruitier du Muséum*. His observations were made upon the living trees, many of which his predecessor, Thouin, had got together and they are characterised by the same minute accuracy of detail and careful historical research that marks his other works. In spite, however, of the many excellencies of this superb work it is doubtful whether in the future Decaisne's researches as a pure botanist will not be more highly appreciated than his pomological labours. In any case in mentioning the latter now we are inverting the natural order of things, for long prior to the publication of this work Decaisne had achieved reputation by his studies among the Alge. In 1841 he was the first to show that the common Coralline of our sea-shores was a genuine seaweed, all encrusted though it be with lime, and not a polyp, as had previously

been supposed. In association with the lamented Thuret also, Decaisne made those discoveries with relation to the male organs of the common Bladder-wrack (*Fucus*), and to the fertilisation of these seaweeds, which entirely revolutionised what was known on these matters previously. His paper on the anatomy and physiology of the common Madder (*Rubia*), at one time so largely used for dyeing purposes, is a veritable masterpiece of lucid exposition and exhaustive treatment and, considering the time at which it was written, and the limitations of the subject, one of the most able memoirs that have ever been published on the physiological history of plants and their bearing on practical cultivation and manufactures. The memoir on the Mistletoe, also, is one of those monographs which no advance in science can ever completely supersede. Decaisne's more recent publications have been almost entirely descriptive and systematic. He elaborated the *Asclepiadaceæ*, and the *Plantaginaceæ* for De Candolle's *Prodrromis*. The *Geraneaceæ* were treated of in the *Revue Horticole*. Other families and genera were monographed in the archives of the Museum, the *Annales des Sciences*—of which he was at first, in conjunction with Brongniart, and afterwards by himself, the botanical editor—in the *Flore des Serres*, and other journals. *Rosaceæ*, and more especially *Pomaceæ*, received very great attention at his hands. By his researches in the development of the flower-bud, from the earliest stages to the adult condition, he made known the fact, now generally accepted, that the so-called calyx-tube of these plants—that which forms the eatable portion of the Apple and the Pear—is the top of the flower-stalk rendered swollen and succulent. Decaisne was an admirable draughtsman, and this circumstance, combined with his long-continued and very extensive studies in almost all branches of the vegetable kingdom, lend particular value to the general history of the natural orders which he published in conjunction with Le Maout, and which was issued in an English version under the editorship of Dr. (now Sir Joseph) Hooker. The extent and comprehensiveness of his studies, and the fact that, to a large extent, he had, where circumstances permitted, availed himself of observations and experiments on living plants, for which his position at the Jardin des Plantes gave him exceptional facilities, give special importance to his views as to the nature, limitations, and development of species. On these points Decaisne seems to have held opinions intermediate between those who would elevate every variation to the rank of a species and those who would combine all variations into a small number of species. His studies on the variability of fruit trees, aided as they were by observation and direct experiment, led him to reject the theory of Jordan, who sees in each one of the many hundreds of varieties of Apples and Pears a distinct species bounded within its own limitations, incapable of transgressing them or of becoming merged in another. Decaisne, of course, recognised that out of these hundreds of varieties none could be called wild, and he asks, therefore, with much cogency, if all these varieties are true species, where are they now, or where were they once wild? To escape the difficulty M. Jordan was obliged to assume that the wild forms were antediluvian, and all lost during the catastrophe except those which had been domesticated prior to the Deluge and which Noah took with him into the ark! It will be new to pomologists that Noah was the most eminent of their race.

By observing the countless variations from seeds of Pears, Apples, Strawberries, and the like, Decaisne was compelled to acknowledge that they had all proceeded from a few original forms, and to that extent he may be claimed as an evolutionist. Moreover, he distinctly announced his conviction that Nature has not two ways of working in this matter, "she acts

in the fields as she does in the garden." Nevertheless he retained to the last a firm conviction in the existence of species and genera as understood in the pre-Darwinian days, and in their limitation by definite, though often extremely wide and elastic boundaries. Thus he was firmly convinced that the Apple (*Malus*) and the Pear (*Pyrus*) were two absolutely distinct genera, and that those botanists who, following Linnæus, combined the Apple genus (*Malus*) and the Pear genus (*Pyrus*) under one and the same, acted in opposition to the plain teachings of Nature. He showed the numerous points of difference, morphological and structural, between them, and denied the existence of any transitional forms between them sufficient to constitute one genus. As an instance of the thoroughness with which he investigated things, he communicated with the writer of this notice as to the existence of certain forms of malformation peculiar to the Pear and to the Apple respectively; thus, while twin Apples are not uncommon, twin Pears—*Ec.*, two Pears more or less united together, side by side—are almost, if not quite, unknown. On the other hand, while prolific Pears, in some shape or other, are extremely common, M. Decaisne had never seen a similar malformation in an Apple, and the present writer only once or twice, as contrasted with the many scores of similarly affected Pears that have passed through his hands. Similarly, Decaisne could not give his assent to those who would combine the Sorbs and the Quinces with the Apples and Pears under one genus. The alleged transformation of the wild Radish, Carrot, or Cabbage into the cultivated varieties was not credited by him.

Comparisons have often been instituted between the Jardin des Plantes and other botanic gardens, but not always fairly. The funds at the disposal of the administration of the garden have always been very modest in amount, while the idea of the authorities has hitherto been to maintain it as an educational establishment solely, and in no sense as a pleasure-ground. Whether this was a wise procedure, and whether better cultivation, more attractive arrangement, and a more catholic appreciation of botany and horticulture as a means both of popular and of strictly scientific education, would not have secured in the end, in an establishment supported by public funds, even greater benefits for pure science, are questions we do not care to discuss in this place. The idea which Decaisne held was that the Jardin des Plantes was exclusively a scientific establishment, like a university botanic garden, and that by keeping the houses for the most part closed to the general public, and only available to professed students he was enabled to retain and cultivate a considerable number of plants of scientific interest, but which are not attractive to the general public by the elegance of their vegetation or the brilliancy of their flowers. Decaisne thoroughly identified himself with the establishment which he directed, and he was ever ready, as we have reason to acknowledge with gratitude, to dispense the resources of the garden among his fellow workers, and to communicate to them the results of his own observations and study. In this manner, on many occasions, the readers of this journal for several years past have profited by the experience and knowledge of the eminent French botanist and pomologist. His devotion to his work was specially manifested in those most trying days—in 1870-71—when the German army begirt Paris. In January, 1871, over eighty shells fell within the precincts of the garden; some of the stoves were shattered to atoms, such as the Orchid-house, the Fern-house, part of the Palm-stove, the aquarium, and a house wherein were grouped together a collection of plants of special botanical interest. This destruction occurred at a

time when the thermometer registered -10° C. of frost. For more than a fortnight this frightful state of things continued, Decaisne sticking to his post and doing his best to protect the plants under his charge. In the midst of all his cares his observant faculty led him to remark on the singularly different effects which the projectiles had upon various groups of plants. Writing to us early in 1871 he remarks how the *Pandanus*, the *Cyclanthes*, the *Dracenas*, had their leaves torn to ribbons, while the *Bromeliads* were not only uninjured by the explosions, but were not hurt by the frost which destroyed so many nearly allied plants. It will be remembered that our horticulturists, headed by the Royal Gardens at Kew, did their best to repair the losses which were then experienced, and that the greatest sympathy was felt for the administrators of this famous establishment, but in many cases the losses were irreparable. As Decaisne wrote pathetically at the time, "Who will restore the *Malpighiaceæ* that Adrien de Jussieu, the monographer of the order, gathered together with such pains and assiduity? Who could replace the historical plants of Anblot, of Commeron, or Du Petit Thouars?" Ten years and more have elapsed since that dreadful period—ten years in which Decaisne, whether in his capacity as Academician, or as a publishing botanist, remained as active as many a younger man who had not passed through such terrible experiences.

In the year 1871 we published a slight sketch of the interesting history of the establishment over which Decaisne presided, and in the same year we gave a portrait of the eminent botanist to whom on so many occasions the readers of the *Gardeners' Chronicle* have had reason to be grateful. Decaisne died somewhat suddenly on the 8th inst., and was buried on the 10th in the presence of a large concourse of his former friends and associates.

New Garden Plants.

COLUMNÆA KALBEYERIANA. (Fig. 32.)

We have already alluded to this plant at p. 44; a full botanical description, together with a coloured illustration, will, we believe, be given in the *Botanical Magazine*. Suffice it here to say that it is a stove plant, the foliage of which is very striking, from the manner in which the lance-shaped leaves, which are opposite, curve downwards on either side of the stem. One leaf of each pair is much larger than the other, and the large and small leaves alternate, so that while that on the right is large that next above it on the same side of the stem is small, and so on. The leaves are dull green above, sometimes spotted with pale yellow, the lower surface being of a deep claret-red. The calyx is yellow, as is also the corolla, which latter is not shown in our illustration, taken from the plant when first exhibited by Messrs. Veitch, when it received a Botanical Certificate, though in an unexpanded condition. The corolla exceeds the calyx in length, and is marked with red stripes in the interior. It will make a very striking plant for exhibition purposes. The plant is also mentioned in the *Florist and Pomologist* for the present month.

CATLEYA DORMANIANA, *n. sp.*; *prope eadem*, que LELIA DORMANIANA.

The first flowers I had from Mr. R. Bullen proved to be as much *Lelias* as those of *Lelia elegans*. There were sometimes eight independent pollinia, with four much smaller ones, at other times four cohering on both sides with the caudicula. Now Mons. D. Massange de Louvrex kindly sends me a flower of what is a true *Catleya*, with four pollinia only. There is also a good mark of distinction in the perigone itself, it being distinctly coloured. Neither the sepals nor petals are blotched at all, but tinted with cinnamon all around the borders, leaving the disk alone greenish-yellow. There are also purple longitudinal stripes on the back, sides and front of the column. The pseudobulb and the two leaves (of

light red for very long time, as Mons. D. Massange observes) appear not to differ at all from what I had from Mr. K. Bullen.

One might have expected such phenomena, and yet one cannot help wondering at them. I feel as convinced as possible in such a case that

doubt it would be very desirable to watch the individuals, to ascertain whether they are constant in the character of their anthers. *H. G. Rehb. f.*

ARALIA QUINQUEFOLIA GRACILIS.

This is a shrub of slender habit, with very long cylind-

segments. Though no other *Aralia* was in flower at the same time as the plant of *A. quinquefolia*, none of the seedlings have come true, two-thirds of the batch being of the type now called *gracilis*. *Aralias* are, however, notoriously variable, leaves of different forms very often occurring even on the same individual

FIG. 32.—COLUMNNEA KALBREYERIANA: LEAVES CLARET-RED, FLOWERS YELLOW. (SEE P. 216.)

the parents of this and of *Laelia Dormaniana*, the prior type, are *Laelia pumila* and *Cattleya bicolor*. We have now a typical *Cattleya*, a starved *Laelia*, and we may expect a typical *Laelia* with eight developed pollinia. The Massangean plant may be of different origin, since it was purchased of Mr. Williams at the Victoria and Paradise Nursery. No

dical leaf-stalks, the blades being divided palmately into five linear remotely toothed segments. It comes from Messrs. Rodger, McClelland & Co., of Newry, in whose nursery it was raised from seed saved there from the typical *A. quinquefolia*, which, like one called *A. Schefferia* in Continental gardens, is closer in habit, with shorter leaf-stalks, and much broader

plant. The plant before us is a very nice one, and will be very useful, especially as Mr. Smith informs us a few degrees of frost will not hurt it.

ODONTOGLOSSUM WILCKEANUM PALLIDUM, n. var.

This is a variety with light whitish sulphur-coloured flowers. There is one large brown spot on each

sepal, but there are no spots on the well-toothed acuminate petals. The lip is rather acute, nearly firmate, and has a few brown spots. I have to thank Mr. W. Bull for it. *H. G. Rehb. f.*

ONCHIDIUM LANCEANUM (Lindl.) LOUVREXIANUM, *n. var.*

A magnificent variety of this good old plant, with very yellow sepals and petals, nicely spotted and marbled in a very pretty manner. The greatest charm is that while the base of the lip is of the finest, darkest mauve, the front part is of the purest white. All the flowers I saw had two anther-like organs at the very base of the stigmatic hollow. It was purchased at a Santerian sale in Mr. Stevens' Rooms, July 8, 1880, and flowered at the Château de Baillyville, Mauche, in the fine collection of Mons. D. Massage de Louvrex. I feel pleased to dedicate it to this enthusiastic grower of Orchids. *H. G. Rehb. f.*

CYRIPEDIUM DISCOLOR, *hyb. ex typ. C. venusti.*

Leaves very fleshy, dark glaucous, scarcely showing vestiges of narrow hieroglyphical markings. Peduncle dark purple-brown, hairy. Bract very short. Odd sepal triangular, with sixteen dark purple stripes between the green nerves. Sepals connate in a triangular much-tapered bidentate emarginate body with a few green nerves, brownish-purple at the base. Petals ligulate, blunt acute, light reddish, green at the base, with numerous dark purple spots at the base, and a few bristles over the base. Lip, as in all types of the affinity, a long blunt shoe with lateral horns at side of the mouth, pallid reddish-brown with ochre-coloured areas. Staminode transversely elliptic, with an incision at the back, one in front with an intermediate tooth, pallid green with some short dark green venations. This is one of those already mentioned hybrids or aberrations which were raised in the collection of Mr. K. Warner. They are now in the hands of Mr. B. S. Williams. The name *discolor* is given both on account of the great contrast of perigone outside and inside, and the curious difference of colours on the lip. *H. G. Rehb. f.*

CYRIPEDIUM WILLIAMSIANUM, *n. hyb., dub. orig.*

This is a fine thing, reminding one of *Cyripedium villosum*, and comparable to *Cyripedium Harrisianum* and its nearest relation, *Cyripedium Dauthieri*, that came from the garden of M. Massage de Louvrex, of Saint Gilles, where it was grown by M. Charles Kramer.

The leaves have a distinct darker network. Peduncle light brown, hairy. Bract green, with rows of dark brown-purple spots. Odd sepal oblong acute, very large, white, with dark blackish-brown middle line and prominent nerves green. Sepals reaching three-fifths of the length of the lip, of the same colour, without a dark middle line. Petals oblong ligulate acute, with very short bristles on both sides, dark brown middle line, nice reddish, with some sepia, on the upper side, white, with hue of lightest copper on the lower side, chief nerves all green on both sides, but nearly vanishing on the upper side. There are numerous small dark spots in rows near the base. The lip is like that of *Cyripedium villosum*, but the side horns on either side of the mouth are much shorter, ochre-yellow beneath, light brown above, with an ochre limb around the border. Staminode light copper-ochre coloured, with few green nervilli, covered with short hairs.

This is the best of the Warnerian derived hybrids. It is a curious fact that in plants derived from some cross there appear such very different individuals. Look to the *Cattleya fausta* of Messrs. J. Veitch & Sons. Thus I should not be surprised if all these Warnerian hybrids were produced by fewer crosses than there appear distinct types. At all events, this curious neatly shining plant may bear the name of its present indefatigable possessor, Mr. B. S. Williams. *H. G. Rehb. f.*

LYCASTE SULPHUREA.*

This has a smaller flower than a good *Lycaste cruenta*. The sepals are more acute; the superior sepal ligulate acute, the side ones oblong, markedly acute, all pallid sulphur coloured, with very small red blotches inside; petals oblong, apiculate, light sulphur coloured, with a few brownish-purple spots, and

* *Lycaste sulphurea*.—Aff. *L. cruenta*, Lindl. : flore pallide sulphurea; labelis laciniis lateribus semiovatis angulatis, lacina antica ligulata acuminata reflexa, callo mediano obtusangulo (non quadrato). *H. G. Rehb. f.*

a large dark purple blotch at the base. Lip pallid sulphur, purple between the side laciniæ internally; callus and angles of the side laciniæ inside deeper yellow, nearly orange; column much like that of *Lycaste cruenta*, plump, short, broad at the base, light sulphur, deep brown, purple at the base, with brown purple spots above. There are not so many hairs at the base as in *Lycaste cruenta*.

I suppose this to be a cross between *Lycaste Deppi* and *cruenta*. Curiously enough, it appeared nearly at the same time with Mr. Williams' *Lycaste Deppi punctatisima*. I obtained what I have seen of this plant from Mr. W. Bull. *H. G. Rehb. f.*

TACSONIA PARRILE, Mast., n. sp.* (fig. 34, p. 255).

This is a new and very remarkable *Tacsonia*, the introduction of which is due to Senor Parra, better known as Parrilla, who communicated it to Mr. Carder. The materials at our disposal consist of dried flowers and foliage together with a coloured illustration, which though in more than one point not botanically correct, is sufficient to show how remarkable an addition to our stove climbers this species is. The three-lobed leaves are glabrous above, pilose beneath, the stipules entire, subulate acuminate, the leaf-stalks channelled on the upper surface and provided with a variable number of sessile glands. The flower-stalks are cylindrical, longer than the leaves. The bracts unfortunately are wanting in our specimen, and are not represented in the sketch. The flower-tube is long, slender, and glabrous, distended and sulcate at the base; the five sepals are of a rosy-orange tint, oblong-hooded and provided with a remarkably deep wing terminating in an acute point, the wing being much deeper than in any other *Tacsonia* of which we have any knowledge, and the sharp points of which are shown in the sketch, wherein, however, the conformation of the flowers is not well brought out. The oblong-flat petals are considerably shorter than the sepals, and are of a rich orange colour. Judging from the dried specimens, the corona in the throat of the tube consists of an outer row of tooth-like projections, and an inner membranous fold bent downwards. The stalk supporting the stamens and ovary is very slender, the ovary itself elliptical and pilose. We are not cognisant of any species with this floral conformation and this peculiar colour, nor can we find mention of any similar plant in Messrs. Planchon and Triana's monograph, issued since our own enumeration in the *Flora Oranienensis*. The stock is in the hands of Messrs. Shuttleworth, Carder & Co., who have introduced the plant from Tolima, and at whose request the plant is named. *M. T. M.*

PEACHES AND NECTARINES OUTSIDE.

THE uncertainty of obtaining anything like regular crops of Peaches and Nectarines of the older sorts on outside walls has led to a falling off in their culture; but this deficiency has been met in many cases by erecting glass structures in which to grow them. That first-rate trees can be grown on walls needs no proving, though really good trees, such as those at Ditton Park, which were noticed in the last volume of the *Gardeners' Chronicle*, are not often met with at the present day. Within the last few years quite a host of new Peaches and Nectarines have been added to our older sorts, and it is of some of these new sorts that I wish to speak, as, judging from the free way in which they have fruited here during the past three or four seasons, there is still hope of once again obtaining good crops of these choice fruits on open walls.

Among the new Peaches the first place is a sure fruiter must be given to Sea Eagle. It is a handsome, moderately late Peach, and it has not failed here to set a full crop of fruit during the past three seasons,

* *Tacsonia Parrille*, Mast., sp. n.—Folii breviter petiolatis, petiolis glandulis sessilibus præditis; stipulis subulato-acuminatis integris, lamina superiore glabra subtus albidis pilosis, e basi connata ovatis profunde trilobatis, lobis lanceolatis apiculatis remote denticulatis, lobo medio longiore; pedunculis petiolosis folio longioribus; bracteis hand visis. Floribus 6-poll. long. roseo aurantiacis, tubo cylindrico lato ventricoso sulcato, segmentis externis (sepalis) oblongis apiculatis scaphiformibus profunde alba-carmatis alba superne aristatis; segmentis internis (petalis) quam sepala dimidio brevioribus oblongis obtusis rubro-aurantiacis; corona faucibus duplici (extera externa e processibus dentiformibus obtusioribus erectis conferta, series interna e plicis carnosulis inflexis constans); corona basali ad basin tubi membranacea inflexa; gynandrophoro gracili exserta; ovario elliptico piloso. Floris strudantur imperfecte representat icon. *M. T. M.*

and the fruit has ripened perfectly by the end of September. As a mid-season kind, Goshawk has proved the best. It is a large pale-coloured Peach, of first-rate quality, but rather coarse in the skin. It ripens about a fortnight earlier than Sea Eagle, and has never failed to set and carry a crop of fruit under adverse conditions. Among the earlier kinds, Alexandra Noblesse is the hardest, and it will prove a valuable acquisition for outside culture. It is said to be a seedling from the old Noblesse, which it certainly resembles in the fruit, but in hardness and freedom of growth it far surpasses its parent. Among the older kinds of Peaches that we have most frequently seen carrying crops, both in the North and in the South, are Crawford's Early, Bellegarde, Dymond, Malta, and Late Admirable.

Out of the new Nectarines there are three that deserve special notice; these are Lord Napier, Darwin, and Humboldt. The first-named is the finest Nectarine in cultivation; and is equally suitable for indoor or outside culture. It is the latest to open its flowers, and the earliest to ripen. We have never failed in having good crops of this kind outside; and we have had fruits of it from under glass that weighed over 7 oz. The best to succeed Lord Napier is Darwin. This is an Orange Nectarine, very like the old Pitmaston Orange in appearance, but it is with us quite three weeks earlier than the Pitmaston, and is equally rich in flavour. This variety has pleased us so well outside, both in quality and appearance, that we have this season planted it under glass. As a late variety to fruit to the end of September Humboldt is the best. This has every season set well here and ripened its fruit perfectly. It is an Orange Nectarine of the largest size, and will yet become popular both for indoors and for outside walls. Another fine Nectarine that always sets well outside is Victoria, but it is only in the finest seasons that it ripens outside, and is seldom satisfactory except under glass. When favoured with these conditions it is the finest late Nectarine in cultivation. There are two of the older sorts that I have so often seen carrying good crops on walls that they deserve mentioning; these are Balgown and Downton, and they are both first-class kinds.

In selecting trees for outside culture preference should be given to trees on stems about 3 feet high that have been grown in good sound loam free from rank manures, as gumming generally lays hold of over-stimulated young Peach trees, and when this is the case the trees soon present a ragged and unbalanced appearance. A tree on a 3 or 4 feet stem has an advantage over a dwarf in having its most tender and vital parts farther removed from the dampness of the surrounding border. Trees of this character should never be planted on walls less than 10 feet high.

The border should be thoroughly drained to ensure success, as it is impossible to get the wood in the best condition in an undrained border, and the trees are much slower in going to rest in autumn under the latter conditions, and seldom set well in spring owing to the sappy condition of the young wood. The best soil for the border is a good calcareous loam, ramming it in thoroughly firm. Where a soil of this character cannot be had then we recommend the best strong loam that can be got, and to this should be added one good barrowload of chalk to every cartload of loam, with the addition of a little burnt earth.

In training the trees adopt the fan system, as in no other way can the walls be so regularly furnished with fruiting wood. Of late we have seen many recommendations to grow young Peach trees like Willows, but this system will not do for outside trees, as we do not want growths for making baskets, but to produce fruit. Aim at getting moderate growths while the trees are young, and spread these thinly over the wall, using the thumb and finger in regulating the trees in summer in preference to using the knife too freely in winter. In the early stages of the trees a slight check at the roots will sometimes be advisable, which should be done early in the autumn. We prefer the trees nailed to the walls to any system of wiring we have yet seen adopted, and great care should be exercised in the nailing, as a shoot once bruised sooner or later dies a premature death from gumming. When the trees reach fruiting size, it is sometimes advisable to thin out the foliage in early autumn as soon as the fruit is gathered. This lets in the sun on the wood and the wall, and this materially assists the wood in ripening. When the wood is not fairly ripened, the trees often get into growth before they

flower; when this occurs no time must be lost in disbud-
ding early, otherwise the growths will take all the
strength of the tree from the blossoms, and the result
will be failure. During hot, sunny weather it will
be an advantage to the trees to cover their stems with
haybands up to a little above their union with the
stock. *J. Roberts, Gammersbury.*

NORMANTON PARK,

THE seat of Lord Aveland, in Rutlandshire, is
pleasantly situated midway between Stamford and
Oakham, in a picturesque district charmingly wooded
and surrounded by a park of over 500 acres in extent,
in which a fine herd of deer is kept. My ambition
to pass through Empingham grew more intense when
I learned that it was by the same route their Royal
Highnesses the Prince and Princess of Wales had
travelled in January of the present year when they
honoured Lord Aveland by a visit to Normanton,
where preparations on a grand scale were made for
their reception.

The avenue leading to the house from Empingham
is a solid, clean, and well-kept road, ornamented by
two fine rows of Sycamore and Beech. The mansion
is of the Ionic style, rebuilt on the site of the earlier
house at the close of the past century.

At the bottom of the grounds there is a stream
which has been broadened into a lake, with an island
in the centre to afford cover for the water-fowl, which
are numerous upon the lake. The stream is a
tributary of Rutland's river, of the gwash or wash
of which Drayton in his *Polyolion* said—

“What river ever rose from bank or swelling hill
Than Rutland's wandering wash a delicateser rill.”

Looking from the house across the lake there are
beautifully wooded slopes, of which Hamilton Hill is
most conspicuous, and extensive views of rich scenery
abound in the direction of Exton Park and Burley-on-
the-Hill. The terrace garden is on the north-west
front, and is adorned with statues and ornamental
trees. Spring gardening is here of great importance,
and perhaps after all the spring garden is the sweetest
of all outdoor garden enjoyments. Plant that is well
spoken of at Normanton is *Heuchera lucida*, which pro-
duces an insignificant flower, but the “brone” foliage
is said to be very pretty in the spring—plants, how-
ever, colour differently in different soils and situations.
A glance at the Golden Alder on the island referred
to reminds me that it is seen to best advantage in a
distant situation, and the colour is so strong that the
plant should be sparingly used, unless, indeed, a
whole bed of it is planted for some special purpose.
April and May are the two months to see the flower
garden at Normanton, although the vases, statuary,
and specimen trees are always of interest to
the visitor whose mind is not wholly absorbed in
summer flowers. The north-west wall is gay with
a grand specimen of *Pyraanthra* trained horizontally;
its berries are so numerous and profusely produced
that the wall is a picture of livid red, which is well
shown off by its association with evergreen trees and
shrubs; indeed, a general superabundance of green
requires something associated with it, contrasting in
a greater or less degree, or the eye grows weary of
so much sameness of colour if there is nothing
striking to vary the scene and brighten up the general
effect.

Several good specimens of *Taxodium* and *Wellingtonia*
are thriving upon a lawn by the side of
a border of shrubs and mixed flowers comprising
Snowdrops, *Crocus*, *Daffodils*, *Anemones*, and spring
flowers generally. Flower gardening upon the grass
has been carried out here for many years, and very
naturally the plants appear to be disposed under and
between the trees and shrubs.

The finest specimen *Wellingtonia* in the grounds
is 41 feet high. The rockery upon the north side of
the pleasure grounds is planted with a very interesting
collection of alpine plants and Ferns—the latter, how-
ever, not doing well during the past summer, in con-
sequence of the extreme drought. Some of the
plants that struck me as being well adapted to the
place, as well as being pretty, include the following:
—*Saxifraga Wallacei*, *S. Maweani*, not so good
as the former; *Helianthemum oculatum*, cream
colour, with a yellow centre; and *Red Dragon*, also
very handsome as a rock plant, and of good habit
for a sloping border either among stones or roots.
At the base of the rockery Mr. Grey has managed to

establish some healthy clumps of *Primula denticulata*.
The plant has been killed in many places where every
condition seemed favourable to its cultivation, and
yet it spreads rapidly among rocks where it is shielded
from cutting winds. Even with the hardest of plants
there are many points to be considered in their culti-
vation. Other plants adapted for rock gardening are
Saxifraga phelata, which throws flower-spikes from
12 to 18 and 24 inches high, and *Campanula gar-
ganica*.

Outside the rockery are some notable trees of
Cupressus macrocarpa, *Wellingtonias*, and the decidu-
ous *Cypress*, *Liquidambar styraciflua*, *Mespilus
ulgaris*, 100 years old, and the feathered *Sumach*,
which is a very handsome shrub for pleasure grounds
in autumn. The Cedars of Lebanon have suffered
from the effects of the past winter, rather than from
the weight of snow resting upon their branches than
from injury from frost. A large Mulberry tree
bears the mark of great age, and also other trees
which are dying of decay; but Mr. Grey has antici-
pated the inevitable result of old age, and planted
many young trees several years ago, which will fill
their places, if not with as much interest, at least
with more effect.

The kitchen garden is entered from the north-west
side, and there are two long borders planted with
horizontal trained cordons a foot high at the back,
which are pretty either in flower or in fruit. The
borders are planted with bulbs and spring-flowering
plants, and are a notable feature in these gardens
during the spring months. The south-east wall run-
ning parallel with these borders is planted with Peach
trees of the usual run of established sorts, which were
bearing heavy crops, and are in good health and
free from the attacks of insects, which accounts
for the size and quality of the fruit. In one of
the borders I noticed several patches of ornamental
grasses which appeared to me to be most useful for
arranging with cut flowers in autumn, and save the
interminable slaughter that is made amongst the
choicer kinds of exotic Ferns. One of the best out of
several seemed to be *Pennisetum longistylum*, a hand-
some grass with a feathery plume, which would at
least be an agreeable associate with floral arrange-
ments for the dinner-table. The garden, I should
have stated, is a square cut in two by a broad central
walk having borders of hardy flowers upon either
side. The most prolific varieties of Apples here are
Lord Suffield, *Stirling Castle*, *Warner's King*, *Scarlet
Nonpareil*, *Keswick Codlin*, and *Jolly Beggar*, all of
which are to be supported, so heavy was the crop, and
the size and quality of the fruit were also good. The
south-west wall is planted with Peaches, the north-
west wall with Pears and Plums, and the border with
plants for spring bedding. Adjoining the large
kitchen garden, there are three smaller ones taking
the form of three triangles, and the walls of which are
planted with healthy trees in full bearing. Morellos,
of course, are always relegated to the north side of
walls, and no more profitable crop can be grown in a
garden. Many of the borders are used for growing
flowers for cutting and for raising plants for spring
bedding. Among the showiest flowers I noticed
Centranthus macrosiphon, a Valerian-like flower,
raised from seed sown in the spring; *Delphinium*,
also raised from seed; *Schizostylis coccinea*, coming
into flower, and *Gladiolus Colvillei alba*. Apricots
succeed well in one of these gardens, and the trees for
a wonder are free from canker or disease. In the
framing-ground, Azaleas and large plants of *Imantophyllum
miniatum* are being hardened by exposure to
the weather, and other winter flowering plants are look-
ing equally prosperous. The hot-houses, pits and frames
contain excellent examples of plant and fruit growing.
The first structure that I have to notice is a fernery
chiefly filled with varieties of *Adiantum* for cutting,
and plants for furnishing, of which large stocks are
required during the winter and spring months. Mr.
Grey adopts a very good system with this class of
plants: he lowers the temperature gradually through-
out the autumn in order to secure that firmness or hardi-
hood which is necessary for plants to possess that are
subjected to the rough usage of exposure, gaslight,
and other deleterious influences which furnishing
generally entails upon plants. *Cyrtopodium insigne*
is grown in a cool frame during the summer, and
never fails to yield abundance of flowers, which come
in under the cool system of cultivation at mid-winter,
when it is most important to have them; *Primulas*
are grown in large quantities; *Browallia elata* in small
pots, flowering Begonias by the hundred, and *Fuchsia*

and Tree Carnations for winter flowering
in proportionate quantities.

The *Selaginella* Mr. Grey also uses largely for
table-work, his favourites being *apoda* and *Kraussiana*.
In a house of miscellaneous plants I noticed, among
others, *Ardisia crenulata*, *Begonia Froehlii*, *B. insignis*
and *B. metallica*; *Crotons*, *Dendrobium*, *Phaius
grandiflora*, *Plumbago rosea*, *Andurium Scherzerianum*, &c.

Mr. Grey also grows *Chrysanthemum frutescens*
and *C. Etioleda* Op, planted out in the open borders,
and grand plants are kept for lifting in the autumn. In
the vineries good crops of *Muscats* and *Lady Downe's*,
as black as Sloes, were ready for cutting, the early
houses of course being cleared of their crops some
time ago. It is hardly necessary to say, in conclu-
sion, of so experienced a cultivator as Mr. Grey that
his charge does him credit, and that fruits, vegetables,
and plants, and everything else under his manage-
ment gives evidence of high cultural skill, and a
system of garden administration of the first order.
W. H.

THE COFFEE-LEAF DISEASE.

[We have received a lengthy communication from
Mr. Storck (now resident in Fiji), and who was
assistant to the late Dr. Seemann in his mission to
these islands) on the means for combating the leaf-
disease, *Hemileia*. Mr. Storck reviews the previous
attempts that have been made, and then details his
own method, which he claims to be effectual, and the
principle of which is the diffusion through the planta-
tions of carbolic acid vapour, injurious to the fungus.
It is obvious that the success of the plan depends
upon very many circumstances, which should induce
cautious experiment on a small scale before embark-
ing on a large one, such as the depth to which the
fungus penetrates, the state of the weather, the
condition of the Coffee-plant, the influence of the
poisonous vapour upon it, &c. Should Mr. Storck's
experiments prove in other hands as successful as
according to his statements, supported by other
testimony before us, they are in his own, he will
prove a veritable benefactor, and should receive the
reward of his public-spirited endeavours to remove
a great scourge. It is obvious that the principle is
applicable *mutatis mutandis* to the treatment of other
plants affected with superficial moulds. E.D.]

My own method of application, says Mr. Storck, is
purely atmospheric, and for the benefit of the
countries and planters suffering from the ravages of
Hemileia vastatrix I will now give a description of it.
In doing this I rely, as regards my rights of priority
and proprietorship in an invention of great import-
ance, upon that spirit of justice and fair play so gen-
erally obtaining in the scientific and planting world.

An acre of Coffee land contains thirty-six centres
of vaporisation formed by tin vessels to be mounted
upon short sticks, and covered in a peculiar manner,
to protect the contents from rain and rubbish, thereby
preventing waste and undesirable dilution by rain of
the fluid contents of the vessel. They consist of a
mixture of carbolic acid and water in the proportion
of from 3 to 10 per cent. of Calvert's best No. 5
acid, at the option of the operator. Any strength
not exceeding 25 per cent. may be used, since nothing
touches the plants or the soil, nor injures the tenderest
young leaf or flower-bud. In starting the treatment I
would recommend a first charge of 10 per cent. (5 per
cent. is sufficient), and then a weekly supply of a
density of 5 per cent., which will keep the strength of
the fluid up to 3 per cent. for many months. An
average labourer can in this manner attend to at least
50 acres per week. The first season's outlay per acre,
including the first establishment of the system over an
estate, will not reach £2 10s. per acre, and for any
subsequent year it will not exceed £1. The present
molech of the vessel has an evaporating surface of
4 inches, but I am contemplating an improvement in
it, which will better regulate evaporation, and do
away with weekly supplies, while a further reduction
in the item of labour will be effected. The vessels,
holding rather over half a pint, can be manufactured
wholesale at a £ each, and are so modelled as to allow
of the closest packing, the two parts separately; they
will last for many years.

After eleven months of immunity from leaf disease
enjoyed by the trees treated in a cure by me, and
of a new nursery I had made in the mean time, a gang of
labourers from the upper river carried infection back
to the place. Among the subjects infected were two

Liberian Coffee trees, one among a cluster of five, and another some short distance off in a small plantation of forty, all just in full spike, and to my dismay I also found the nursery badly infected. As soon as I could get the materials I started my system of vapourisation (July 4 last). The two Liberian trees I simply furnished with a small bottle each, partly filled with my mixture of only 3 per cent., hung into the angle of the lowest branches. Both trees have now been perfectly free of the fungus for some weeks, and not a single one of their close neighbours has been infected. They prove to have been completely isolated by the treatment, not a single spore living to reach and infect the others, although in some instances almost touching. With the nursery, covering about three-quarters of an acre, I proceeded in the following manner:—Judging that with so small an area as the above I should be working at a disadvantage through the gas escaping beyond the limits of the area and going to waste in every direction, I arranged my centre of vapourisation a little closer than would be necessary on a large field, and put them 8 yards apart each way. The receptacles of the fluid and their covers were represented by ordinary cups and saucers. Pressing the cups slightly into the ground and mounting the inverted saucers upon three or four short sticks stuck closely round the rim of the cups, I left a clear space of about 1 inch in depth between the rim of the cup and the cover. They were then charged with a dilution of 3 per cent., and the effects noticeable after a few days were most startling. The ripe spores with which the plants, then some nine months old, were fairly reeking, began to change colour from the well-known bright orange to a dull ochre, until they subsequently turned into dirty yellow and then greyish-white. They all, instead of as usual dispersing, remained in a manner glued to the leaves, and afterwards dropped with them, dead, harmless, incapable of propagation. As time went on, all rust which came out began to look dull in colour and sickly, quite different from a healthy crop of spores. By degrees pale rings round the rust patches began to show, indicating the circumference of the mycelia and where their farther development had been arrested. In the third month a large proportion of the spots appeared pale green, whitish round the edges, and as if drying up in the middle; some pushed out a few sickly spores, but very frequently none at all. The spots turned into dry tissue, and most of those leaves, unless too severely attacked, remained on the trees. Thereafter a little dirty-looking rust still continued to appear, but the presence of the disease, up to its complete disappearance, was chiefly indicated by dead and dying mycelia. From what I have witnessed, bare contact with the vapourised atmosphere seems, if not immediately to kill the spores, to effectually incapacitate them for germination. From moving round in the nursery, examining the effects of the treatment, as I frequently did, I would often go in among healthy trees, handle their leaves, pull suckers and the like, but not a single instance of further infection took place among those trees, Liberian and Arabian, which were healthy when the process was started. With grown trees, having leaves of denser texture and more uniform age than nursery plants, which are almost always growing, the effects, although apparently slower at the beginning, are in the end still more pronounced. They lose a greater proportion of leaves at the start, but all disease upon them and in them is dead before the fall, at once neutralising a fruitful source of re-infection. In the case of fairly vigorous trees a new coat of clean foliage, never again to be soiled by the devastating parasite, will have formed by the time the last spore has disappeared.

My method of permanent vapourisation is specially adapted for a country like Ceylon, for instance, when self-sown Coltee in the forest and native garden patches present a standing menace of re-infection, which will defy any other treatment. With the permanent atmospheric treatment any spore of *Hemileia vastatrix* which comes in any way whatever within the radius of its influence must die. As I have asserted elsewhere—"In any one employing my process will reap the full benefit of his outlay, even though his neighbour's field next adjoining or just across the road may be reeking with disease for want of treatment. No live spore can be carried out of the area under treatment—nothing carried in can live, and re-infection becomes impossible."

For the guidance of any planters who may wish to give my system a trial, I will here give the following

directions:—Before my treatment comes into general use, so as to induce the wholesale manufacture of the specific tin vessel, planters will have to make shift as I did, with cups and saucers, which must be so placed that they will not be overturned or buried by storm-water coming down the hillside, which contingency is avoided with the tin-vessel mounted on a stick. Presuming the distances between the rows and in the rows of Coffee trees to be as usual (6 feet), commence at the corner of the field, say working from right to left, start with the third tree in third row, then follow the base line, placing a vessel in every sixth row between the third and fourth tree. When the base line is thus marked off, start at right angles along the rows, count six and place your vessels between the sixth and seventh trees in a line with the trees, so as not to obstruct work and passage; put down your cups, drive three to four short pegs immediately round the cups so as to steady them, and let the inverted saucer rest on the top of the pegs. They must be of even height and long enough to allow the spout of a watering-pot or other feeding vessel to pass through under the roof to save the trouble of lifting it every time—but they should not be so high as to allow rain and rubbish to be blown in by the wind; and then place a stone up to the size of a fist to make all more secure. This done you may go on charging your vessels with a density of at least 5 per cent., but, as said above, I would for the first charge recommend a density of 10 per cent. The effects of the first week's dense vapour will amply repay the extra outlay in striking a deathblow, not only against the rust in full development, but—which is the greatest triumph of my system—against the mycelium of the fungus. This first blow will under these circumstances save a large proportion of the foliage, unless too far gone, by instantly arresting the development of the fungus, and killing all that may be still alive on the dead and dying leaves strewn the ground. If the disease is not visibly present, all the better; if the carbolic vapour will in a short time force it to show itself, chiefly in the character of dying mycelia, and save still more or all of the foliage which would have gone in the next attack of disease. The treatment may be started at any time with equal advantage. One week's ordinary weather will be found to evaporate about one-third of the contents of the cups, and thereafter weekly supplies of 5 per cent. will be quite sufficient. Should at any time during a spell of wet cool weather so little water have evaporated (evaporation of the acid goes on continually) that there is not room in the cups to receive the ordinary quantity of diluted acid, raise the density to 15 per cent. or more, or only give a few drops of undiluted acid. All this is easily calculated, and must be left to the discretion of the operator.

If planters are disinclined to make larger experiments, they may try my system with as few as two acres, and they will soon see the contrast between them and the untreated portions of the field. One acre with another will only take thirty vessels. Six months after starting the process those 10 acres and a considerable margin all round will be in full foliage and crop, when the area outside the limit of effective vapourisation may be standing without a leaf, and the crop shrivelling and starving for want of shelter and moisture, and they will find the same result. The experiment, conducted with ordinary intelligence and regularity, will in a few months convince the most sceptical of the value of my method.

The chief merits of my method of permanent vapourisation may be summarised in the following:—

1. Undeniable simplicity.
2. Economy of material and labour.
3. The most perfect control.
4. Complete isolation of material from soil and plants.
5. Complete and unconditional immunity from leaf disease.

I could bring the evidence of several neighbours who have witnessed the condition of the nursery and the few solitary trees, and the effects of my process, but as it could serve no practical purpose I abstain from doing so.

Some months ago I applied to the Fijian Government for protection of my invention, and was refused on the strength of the reading of the local Patent Ordinance, which only partly covers the subject of my discovery, and only applies to inventions of a purely mechanical nature. My process has to be exhibited for many months in the open field, and cannot be kept under lock and key like a new machine, not to mention paltry matters, patented every day. Therefore I commend myself and my interests once more to the good-will and love of justice of the public. *Joseph A. North, Belmont Estate, Rewa River, Fiji Islands, Nov. 25, 1881.*

ROSES ON THEIR OWN ROOTS: WINTER ROSES. —Some of your readers may recollect that I drew attention last year to the fact that on the Genoise Riviera Roses get rest through summer-heat and drought, and that after a few months' rest thus obtained they flourish and bloom freely again in the autumn, when started naturally by the autumn rains, or artificially by watering. I then omitted to mention a fact communicated to me by my gardener, which may be of use in England in striking cuttings. He tells me that when cuttings are taken from these shrivelled-up dry Roses, put in the ground in the blazing sun in September and well watered, the day temperature being about 75° F., and the night about 70° F., they almost all succeed—95 per cent. They throw out leaves within ten days, form a callus in thirty, and sufficient roots to bear transplanting and potting within two months. We struck some hundreds in that way last September, and the 45-pots into which they were transplanted are now full of roots. On the other hand not more than 10 or 15 per cent. of the cuttings, taken at the same time from flourishing well-nourished plants, and similarly treated, have rooted. The cuttings were principally from Madame Safrano, Madame Falcot, Gloire de Dijon, Souvenir de Malmaison, Mdle. Nabonnard and Rubra vera, a Bengal. Of these Roses, the Safrano is decidedly the best winter Rose in this climate; indeed, it is the one on which florists all but entirely depend for commercial purposes in January and February. Not only is it the hardiest winter Rose and the freest bloomer throughout winter, but it has a most valuable quality for the trade—its buds open out in water several days after it has been cut: thus they open freely in Paris and in London when sent by post from the South. Mdme. Falcot has the same inherent quality, and is very much akin to Safrano, although of rather rosier darker hue, but is not, by any means, so free a winter bloomer. I have always had blooms of it so far in the garden, but I have not been able to cut handfuls as I have done of the Safrano all through the winter up to now, February 7. I have found Safrano a late Rose in my English garden, flowering late into the autumn. It is the winter trade Rose here, and probably would be the same in Paris and London, if cultivated under glass for that purpose. It is pretty as an expanding bud, but loses its charm when fully open, being then loose because deficient in petals.

The next best Rose here in winter, at least in my garden, is unquestionably Mdle. Nabonnard, a very lovely Rose, introduced by M. Nabonnard, of Golt Juan, near Cannes. It is a large Rose, of a handsome flesh or light salmon colour, with numerous petals, and looks its best when fully expanded, the colour being then rich in the extreme. The petals are numerous, but are distinct, and the central ones are not crumpled up like those of the Gloire de Dijon. Like Safrano and Falcot, its buds open out in water several days after cutting, but not so readily as the former: that is, the flower must be half open when cut to go on opening, whereas mere buds of Safrano and Falcot open in water. It is not very generally cultivated even here, although it deserves to be, for one or two blooms lighten up a room for days, but I presume it is more delicate to rear. This autumn all our cuttings of this Rose failed, but my gardener says the failure was quite accidental, and that he has often struck it like the others. Banksias grow very freely here, attaining a large size, and they are good stocks for grafting other Roses on, such as the Gloire de Dijon and Cloth of Gold (Chromatella). They succeed perfectly on it, and grow with great vigour. The Gloire de Dijon holds its own as a hardy Rose, and has flowered all winter with me, but the flowers only open thoroughly in January and February in a very sunny sheltered situation, on a warm wall or hedge, for instance. In other less warm positions large buds form, but do not open in mid-winter. When cut also it remains where it is at the time, the flowers opening no further in water. The buds do not open at all once cut.

The Bengal Rubra vera has flowered freely all the

winter, and decorates the garden, but is only of use as a bud in nosegays; these buds do not open, and the fully expanded flowers fall to pieces almost at once. We have had Tea Lamarques until recently, and plenty of white Bankias freely flowering in hedges. We also have some other Teas in flower, of which I do not know the name; but none of them have the precious faculty of expanding in water from the buds, and of thus flowering and flourishing after several days' journey. Souvenir de Malmaison flowered until Christmas, and then gave in; it cannot be called a winter Rose here.

In December our mean minimum was 44°.1; mean maximum, 55°.2. In January the mean minimum was 44°.2; the mean maximum was 54°.5. In December we had more rain than usual; in January we have had none at all after the 3d. The sea has been calm, the sunshine constant, and the weather glorious. It has been all but midsummer, except the cool nights, all along the coast from Genoa to Hyeres. The mean minimum for fifteen years, as given in my work on the Mediterranean, for Mentone, is:—December, 44°.2; January, 42°.S. The mean maximum is:—December, 55°.1; January, 53°.5. Thus, December was true to that average, whilst January has been warmer—minimum, 44°.3 instead of 42°.2; maximum, 55°.1 instead of 53°.5. *Henry Bennet, M.D., Mentone, Febr. 7.*

PRUNING ROSES.—With reference to the hard pruning of some kinds of Roses advocated generally by "Wild Rose," I may mention that a couple of old trees of *Maréchal Niel* having become apparently somewhat exhausted, I put the knife into them hard, with the result that strong shoots are bursting forth

Economic-house, each span-roofed, and 45 feet long, 28 feet wide, and 18 feet high. Again, on either side are span-roofed Orchid-houses, 45 feet long, 22 feet wide, and 14 feet high. At one end of the range there is a plant stove, and at the other a Succulent-house, each 40 feet long, 30 feet wide, and 21 feet high. Then running back at right angles from each of the end houses is a wing composed of a span-roofed house 35 feet long, 19 feet wide, and 12 feet high, and a circular house 35 feet by 30 feet and 16 feet high; the houses in one wing being for dwarf tropical plants and tropical aquatics, and in the other for dwarf temperate plants, Ferns, &c.

The base of the houses, so far as exposed to view, is to be of polished stone, and all the wood work to be of the best Moulmein Teak wood. The range is to be heated by three of Mr. Dallen's flued wrought iron boilers, each 8 feet long, and a small saddle boiler is provided to heat a row of pipes round the base of the upper roof of the Palm-house. Besides the main range there are to be erected at the back four forcing-houses, each 40 feet long and 10 feet wide; four cool frames, each 30 feet long and 5 feet wide; potting, soil, seed, and tool sheds, and rooms for young men. The boiler-house will be under the north end of the Palm-house, and about 16 feet below the floor level. Provision for storing water has also been provided for, in the form of twelve slate cisterns; and in the heating apparatus there will be ninety valves; the heating and ventilating arrangements also including all the latest improvements. The site of the new range is alongside the Kibble Crystal Palace, which is constructed of iron and glass, and which, it will be remembered, was also built by the Messrs. Boyd.

wealth of catkins on the Nut trees, but I know of none very near. Then there is, some quarter of a mile distant, a large breadth of *Mahonia Aquifolium*, a small quantity of which is in bloom, but I am not sure whether that furnishes the pollen. I remark, however, that the bees when they take flight rise high, and dart right away, evidently bent on a long journey, and apparently with the same confidence they would show were it May instead of February. Whilst we may be in doubt as to whence this food is obtained, there can be none as to its purpose, and we may reasonably hope that it indicates plenty of early and strong brood, and, not least, some early swarms. *Boyd Esq.*

The Poultry Yard.

MATING FOR BREEDING.—All fowls which are to supply eggs for hatching this spring should now be mated for breeding. In many instances this will have been done; but for March eggs, and later on, there is yet time. One of the main points to be observed in mating is to have good male birds. Cockerels, and those two years old, are the best. After this age they are not so good; and, apart from age, it is most important that the male should not be related closely, or at all, to the hens. In-breeding only begets infirm chickens and diminutive fowls. This is not a question relating to exhibition stock alone, it applies to table fowls most particularly, and farmers and others who only breed chickens for home use cannot pay too much attention to this, as it is with such as them that we generally observe the smallest fowls. The remedy is simple, and the result sure. No matter whether the stock is pure or crossed, unfertile eggs are generally the result of having too many hens with one cock. Five hens now and through-

FIG. 33.—VIEW OF THE PROPOSED NEW RANGE IN THE GLASGOW BOTANIC GARDEN.

from the old hard stems in a way that shows there is plenty of life and vigour in the old deers yet. Not the least remarkable breaks are from solid stems as big as broomsticks and as hard, the buds bursting out in the most unlooked-for places, and with a strength that promises presently a fine robust growth. If this be secured, the trees will get a new lease of life. These are under glass and are about eleven years of age, thus showing that in some places the *Maréchal Niel* lives and thrives to a fair age. No doubt, this is as well glass, will bear almost any amount of cutting, but if it is desired to ensure a large number of medium-sized buttonhole buds, the cutting must be directed to that end. If large blooms are needed, hard cutting will best ensure that result. Very coarse growths in the open air are often pithy, and fail to ripen well, so that when severe weather comes the wood is killed wholesale. Glass not only gives the wood protection in hard weather, but it assists in ripening it also, so that doubly it is benefited. Some kinds, Lamarque for example, break so freely that often where one shoot is hard cut half-a-dozen will break out, and some of these will grow very strong. As this Rose flowers best from side shoots, it is better not to cut too hard, and thus ensure plenty of bloom. The *Maréchal Niel* is peculiarly a Rose that needs recuperation, and this is best got by forcing it to make new strong growth by hard pruning, and also by top-dressing the roots, for it is of little use to hope for new life unless the plant is assisted by ample nutrition. *A. D.*

GLASGOW BOTANIC GARDENS.

By the courtesy of Messrs. James Boyd & Sons, of Paisley, the architects and contractors, we are enabled to place before our readers a view of the fine new range of glass-houses shortly to be erected in the Glasgow Botanic Garden on the site of the old one (fig. 33). In the centre there is a Palm-house, 80 feet long, 50 feet wide, and 42 feet high, and on either side an

The numerous plans we have seen seem arranged with a view to practical utility; and with such a cultivator as Mr. Bullen, and such a Director as Prof. Bayley Balfour, the old Glasgow garden ought speedily to resume the importance it had under the management of the late Sir W. Hooker. Glasgow is so favourably placed for the importation of new plants, that with the facilities now about to be offered we may look for great things in the future.

The Apiary.

WITH such a winter as is the present one there should be a good honey-harvest. Bees are having a good time of it; they can get out to obtain plenty of fresh air, and are in the bright sunshine much strengthened. Of course if not well supplied with honey they need feeding, and doubtless it is well to feed in any case, as good honey may thus be saved. But it is quite remarkable to note how much the insects are already helping themselves to natural food. Here, even as early as the 10th, when the sun shone out and the air was clear, the bees were working almost as busily as if it were a pleasant day in April, and coming in laden with pollen mostly of a dull white colour. So many, indeed, seemed to be collecting pollen that they would come tumbling in one over the other a dozen at a time, just as though some large breadth of seed were near and in bloom. I have been much puzzled to understand from whence this pollen could come, and should like to be enlightened. I have thought that a quantity of *Gorse* on Hounslow Heath might be in bloom; but that would be two miles away. Then there is quite a

out March are enough, and after that two or three more may be added.

FEEDING FOWLS.—Extra attention should be given to this now. As all should be laying now, and every egg should be fertile, soft warm food will be morning, and plenty of grain in the evening, will be found to agree with them well. Spratt's patent food, mixed with about an equal quantity of barley-meal, is a grand mixture for them. Buckwheat, English Wheat, Oats, and Indian Corn, are all good grains. Made-up mixtures of all together we do not approve; giving each kind by itself is what we approve. Then a change may be given daily, and this is what they enjoy. Once or twice a-week is often enough to give Indian Corn. It is very fattening, and hens which are over-fat never lay well, and the eggs they do lay are seldom fit for setting, as they are generally deformed. At this season we have had cocks in poor condition, as they will sometimes hardly eat unless the hens are with them, and then they attend more to finding for them than themselves. Their condition may always be judged by taking them in the hands when they are on the roosts at night, and if too tight they may be shut up a little while by themselves daily, and given some extra food. Indian Corn is good here. They may call on their mates for a long time, but in the end they will eat, and afterwards they may be let out again. *Henswife, South Wales.*

ABIES FORTUNEI, LINDE.—In the *Journal of Botany* Dr. Hance notes the occurrence of this tree near Fu-chai, and adds—"I believe Lindley was quite right in referring this handsome tree to *Abies*, though *Carrière* has made a special genus, *Keteleeria*, of it. The cone-scales are not persistent, as stated by Parlatore, but they do not fall so early or so readily as usual in the genus." In museum specimens, however, the scales are certainly persistent. Hance also refers the plants to the Silver Firs (*Abies*). Our much regretted friend, Andrew Murray, however, was the first to unravel the synonymy of this species.

Orchid Notes and Cleanings.

PHALANOPSIS STUARTIANA.—In a recent visit to Mr. Lee's famous collection of Orchids, Leatherhead, I had the pleasure of seeing three very fine plants of this new and rare Orchid, all in flower. Till then I had no idea how very distinct is P. Stuartiana from all other known Phalanopsis, or what a truly beautiful Orchid Mr. Low has introduced for us. Mr. Lee's largest plant has several leaves, one of which measured 12 inches long and over 3 inches broad. The spike, which was then carrying a score of flowers, had long branches and branchlets, from which fact I think we may safely conclude that P. Stuartiana is very free-flowering, even more so, I should say, than P. Schilleriana. Mr. Low possesses dried specimens where on one spike a hundred flowers can be counted, which number, judging from the strength of Mr. Lee's plant, may be reasonably expected under cultivation; P. Stuartiana will then be a grand companion for P. Schilleriana, more than which could not be said of even the chimerical scarlet Phalanopsis, supposing it really appeared. Mr. Lee's appetite for new and rare Orchids is evidently a very keen one, and his grower, Mr. Wolford, must think his responsibility increasing at a rapid rate. *J. C. Spyers.*

MASDEVALLIA CHELSONI.—This is a hybrid between Veitchiana and amabilis. The flowers are irregularly funnel-shaped, the tube of the funnel curved, and the limb divided into one smaller and two lateral larger segments, all broad at the base, acute, and prolonged into long thread-like tails. The colour is indescribably rich and brilliant, suggesting orange, crimson, rose, lilac, or a combination of all these according to the direction in which the light falls on the flower. No artist could render the colour of this flower faithfully, still more impossible would it be to describe it in words. We have before us a flower from Mr. Lee's collection.

CATLEYA TRIANAE.—Amongst several varieties of this species in flower in Messrs. Veitch's nursery at Chelsea, the form named Dodgsoni stands out very prominently for the large size and exquisite beauty of its flowers; these are quite 8 inches across, the sepals and petals of a beautiful pinkish-blush. The front margin of the lip is crimson, the basal portion being pale yellow. C. Trianae alba is also very lovely, being pure white, except the base of the lip, which is pale yellow. Amongst the ordinary forms there is one with a most beautiful crimson lip, richer by many shades than the Dodgsoni form. Some years ago a discussion arose in the *Gardeners' Chronicle* as to the length of time this *Catleya* remained in flower, one good grower contending that it did not last more than a week. It is enough to say that the individual flowers on C. Dodgsoni remained in beauty on the plant in Messrs. Veitch's nursery for five weeks.

ANGREUM HYALOIDES.—Amongst the rare little genus *Angraecum* hyaloides is one of the most charming. It is a tiny plant, in the way of, but smaller than A. citratum. On one little plant with one growth I counted seven spikes not more than 2 or 3 inches long, on which the small pure white flowers are thickly placed. There is quite a thicket of spikes on a small collection of A. citratum in the same house. This fine species is being better appreciated as it becomes more common.

ORCHIDS FROM SEED.—When Mr. Day was advised by his gardener not to seed his rare *Cypripedium*, owing to the great risk, it was simply because of its rarity that such advice was given, as other plants had shown a great dislike to it and even in some cases death had resulted. It was my good fortune to spend three years at Tottenham previous to the dispersion of Mr. Day's collection, and during that time I had a great deal to do with plants in all stages of development as regards seeding, and from very careful observation I can truly say that I was in nearly every instance satisfied it was doing harm. During these three years, many plants of each genus were impregnated, as *Cypripedium*, *Laelia*, *Cattleya*, *Phalanopsis*, *Odontoglossum*, *Oncids*, and in one or

two cases *Vandas*. As regards *Cypripedium* many of these were seeded both by Mr. Day himself and his gardener, both of them very enthusiastic hybridists; some of the *Cypripeds* bore the trial fairly well, while others would after a time bear sufficient testimony that for them it was not the right thing. I found C. superbiens, C. vexillarium, and most forcibly the beautiful C. Spicerianum, amongst those that resisted the hybridist's endeavours the most: the last-named on one occasion bore a very fine pod, the cross being vexillarium, but so much did it seem to suffer, that in order to keep the plant alive we felt at last compelled to cut off the pod in order to save the plant, which in time regained its usual vigour. With our *Phalanopsis* we tried again and again to procure a cross, but always failed even when success seemed at hand. In fertilising these care was taken always to set the lower flower, and also to remove all other flowers from the spike to feel certain there should be no undue strain put upon the plant; yet these one by one lost heart, and in nearly every instance died from what we justly, I think, laid to impregnation. *Cattleya* and *Laelia*, also, at times showed unmistakable signs of distress, owing, I believe, to the unusual size of the pod, and to the long time it often takes to perfect its seeds. *Odontoglossum* and *Oncidium* show, by the much smaller bulbs they make during the time of carrying a seed-pod, that it must be taking vigour from the young growth. In concluding this note I will give verbatim my present employer's views, he being a great lover of Orchids and a most thorough hybridist:—"I have myself lost numerous plants, including a fine variety of *Anguloa eburnea*, and a good plant of the rare *Cypripedium Faircraeanum*." I may say that Mr. Day's plants were far from "the last-straw stage of existence," as Mr. Douglas so forcibly puts it. *H. C., Forest Farm, Windsor Forest.*

EPHEDRUM WALLISH.—This species has made growths 6 feet long in one season in Sir Trevor Lawrence's collection, and by the strength of the young growth partly formed perhaps a greater length will be attained. The long stems are well furnished with clusters of golden-yellow flowers, the sepals and petals sparingly marked with small spots; the whitish lip is marked with maroon-purple lines. Another species seldom seen in flower is *E. rhizophorum*. Here a thrifty plant of it has a compact cluster of its rich orange-scarlet flowers with a paler lip. Like many others of its family, it forms long, rod-like stems.

LELIA ANCEPS.—Growers are beginning to find out that this succeeds well with cool treatment. The variety alba is doing well in Mr. Bull's nursery in a cool-house, and in the Burford Lodge collection. Mr. Spyers has placed some grand varieties in juxtaposition with *Dendrobium Jamesianum* and *D. infundibulum*. On a recent visit the rare and beautiful *L. anceps Dawsoni* was over, but the variety rosea is an admirable companion to it, and was beautifully in flower; it scarcely differs from the form shown by the Messrs. Veitch under the name of *L. flowers Veitchii*. The sepals and petals are white, with the faintest tinge of colour, the lip edged with pale purple, the labellum marked with purple lines, and the throat yellow.

DENDROBIUM CRASSINODE BARBIERIANUM.—The remarkable growths, as well as the compact habit of this plant, of which there are some splendid varieties in flower in Sir Trevor Lawrence's collection—and well flowered too, almost every node having its quota—would place it at least equal with the grand *D. Wardianum*. There are several forms; one well-flowered plant with two spikes had been in flower five weeks. *D. Findlayianum*, in flower too, is a most distinct and beautiful species. When this was exhibited before the Floral Committee it did not receive the highest award given to new flowers, but as it is to be seen now, with its distinct habit, the flowers freely produced, of a delicate pinkish tint, with a bright yellow blotch at the base of the lip, it would doubtless be more highly esteemed.

VANDA CATHICARTII.—Of this Sir Trevor Lawrence has probably the most remarkable plant yet seen in cultivation. It had four spikes of flowers open at once; on one spike there were four flowers, and on the other three spikes three flowers each. The singular flowers were well described at p. 192.

ANGREUM CITRATUM is now to be seen in full beauty in the Burford Lodge collection. On one plant there were five long spikes, which would be in flower in a few weeks; others had two long spikes, all of them giving evidence of its free-flowering character. A. Kotschy had just come out of flower, but Mr. Spyers thinks very highly of it, and places it before A. Elbi. The strongest plant had a spike 2 feet long. It has been recently figured and described.

The Kitchen Garden.

SEED SOWING, &c.—Should the weather keep dry for a few days longer the ground will be in capital condition for proceeding with the following operations:—Plant out shallots, Garlic, and Chives in beds 4 feet wide, with an alley 1 foot wide between each bed, in rows 9 inches apart and 6 inches in the row. The beds should have an even and somewhat firm surface, over which some wood-ashes have been strewn; it should be patted down with the back of the spade, and when the bulbs have been planted—the Shallots inserted by the pressure of finger and thumb barely under the surface of the bed, and the Garlic and Chives a couple of inches deep—the bottom of the alleys should be made level; the beds will then present, as all seed-beds should do, a neat appearance.

Onions, as a rule, succeed Celery, therefore no time should now be lost in taking up the latter and laying the stems in as deep as before in a north border, and the ground should be manured and well dug. The ground, assuming it to be light and pulverised, should be trodden when sufficiently dry to prevent its adhering to the feet, raked and made level with a wooden rake and then rolled with a light roller and again raked, this time and subsequently with an iron rake, the ground having first received a good surface-dressing of dry soil and wood-ashes, after which the drills can be drawn 1 inch deep and 1 foot asunder, and the seed sown thinly and evenly in the drills. The soil should then be closed in over the seed with the feet, and again trodden down over each individual drill and rolled, and finally raked over in the same direction as the drills, so that the bed when finished may present a fine, firm, and even surface. As to varieties, of which I gave a list at p. 82 in your number for January 21, I would remark that the long-keeping varieties and those which are grown chiefly on account of their fine size and for autumn use, should be sown in proportion to their keeping qualities, and a few rows of Early White Naples should be sown to succeed the autumn-sown ones, also a few beds of the silver-skin variety for picklers, the latter being sown broadcast and rather thickly in a poor, dry, and shallow border, in order to prevent them from growing too large.

Carrots and Parsnips should also be sown in the same way as recommended for Onions, except that the rows should be farther apart—from 15 to 18 inches between each row. However, it will be advisable to make two sowings of Parsnips (of which the Hollow Crown and Maltese are good varieties), one now and the other about the end of April, the former for early and the latter for late use. Another sowing of Turnips (Snowball and Carter's Jersey Lily) and Early Nantes Horn Carrot should be made adjoining those previously sown. A small sowing should also be made in a favourable situation of the following seeds, namely:—Wheeler's Imperial Cabbage (or any other early variety), Early Elm Savoy, Brussels Sprouts, Leek (Musselburgh), green and white Paris Cos Lettuce, and Grand Admiral Cabbage Lettuce, round-leaved Spinach (a row between the ranks of early Peas), and Early White and Scarlet Turnip-rooted Radishes—the latter under a south wall between the trees. As soon as the Cauliflower and Lettuce plants, which should now (excepting those intended for early use), be all planted out as recommended in previous Calendars, have been removed from cold pits, the latter should be got ready for and planted with some of the early kidneys from the shelves in the Potato-house, taking care that the young shoots are not broken off in the operation.

RHUBARB, SEAKALE, &c.—Where large quantities of Rhubarb roots are taken up annually for forcing it will be necessary to make fresh plantations of that variety every year, by dividing the roots and planting the divisions with the buds a couple of inches under the surface in rich deeply-trenched ground—the soil being rather light than otherwise—in order to maintain an adequate supply of good established roots for that purpose; therefore advantage should be taken of

the present fine dry weather to get this, together with the overhauling and replanting of the herb-borders, and any other operation that will be as well, and perhaps better, done now than a month later. In covering Rhubarb and Seakale crowns, place a number of Rhubarb pots—more or less according to circumstances—over some of the best established plants of a good early variety and if necessary cover them with long stable litter, a little of which should also be placed over the remaining crowns, which are now on the move, to protect them from injury from frost. The individual rows of Seakale we cover with boxes 8 feet long, 9 inches deep, and about the same width (inside measurement) which are made as follows:—Two boards of the dimensions above given and two end pieces—the latter an inch higher than the sides to keep the lid in its place—are nailed together, and a board of the proper length and breadth placed upon the top as a lid. The necessary number of rows having been covered with these boxes, as the latter are covered over, and the space between them filled with decayed leaves so as to thoroughly exclude light and air from the interior of the boxes; the natural result of plants thus treated is "Kale" of the best description—short, thick, and crisp.

FORGING DEPARTMENT.—Sow in pots Long Red, Cayenne, and Squash or Tomato-shaped Capsicums, placing them in a warm frame near the glass, and potting off singly in thumb-pots as soon as large enough to handle, returning them to the frame. Celery plants, too, when large enough, should be pricked out in rich, finely-sifted soil, 4 or 5 inches apart, in a frame near the glass, or in pots and boxes. If the latter are more convenient, and placed in a similar position, and then watered through a fine rose to settle the soil around the roots of the plants, which should be shaded from the mid-day sun for a few days until the roots have taken hold of the soil, when it should be discontinued, and sufficient air admitted to the frame to prevent the plants making a weakly growth. As the plants increase in growth so also should the ventilation be increased, and subsequently the sashes should be tilted up at night. A pinch of Tomato seed—the Trophy, in my opinion is the best for outdoor culture—should be sown at the end of the present month, as also Marjoram and Basil; also a pinch of Leek seed in a box to be pricked off subsequently and grown on for special purposes where necessary. *H. W. Ward, Longford Castle, Wilts.*

WHEN TO SOW ONION SEED.—Under this heading a correspondent endeavours to show that February is a better month in which to sow Onions than the time usually chosen; but to those who may feel inclined [to be venturesome enough to commit their seed to the ground thus early I would just reiterate *Punch's* advice to those about to marry, and say, "Don't," for although, as "W. H." says, frost does not hurt the seed, I know it does the plants, as on several occasions we have had the tender tops of ours much cut and injured, and yet we never sow till towards the middle of March, which in most districts is quite early enough, as little or no growth can take place till April, and any check from cold to young seedlings always tells seriously against their progress even after fine weather sets in. This being so, there can be nothing gained by making the sowing in February; and it is far better, in my opinion, to wait and be late if the land is not in good order at the ordinary season than to risk having the seed lie so long in the earth, where, if we set in, or snow falls, a great deal of it is likely to rot. *J. S.* [We should add that "W. H." hails from Surrey, and "J. S." from Suffolk. Ed.]

— I have on several occasions sown Onion seeds in February, as recommended by "W. H." at p. 185, and had very good crops of Onions. One year—the ground being in excellent order—we sowed on February 7, and had afterwards a heavy fall of snow, which lay on the ground for a fortnight, but did not injure the seeds in the least, as we had a splendid crop that year. We sowed on the 9th this year, as the ground was then in good condition here. *H. Henderson, The Gardens, Hall Place, Cranleigh, Surrey.*

NOTES ON VEGETABLES.

CULVERWELL'S GIANT MARROW PEAS.—Had I written the article (p. 141) on "New Vegetables of 1881" I should have given the above Pea as much

prominence as possible, as I feel certain that of all new vegetables introduced during the past year none can surpass this in genuine merit. No one could name a fault it possesses, and those who prefer small-podded varieties to it stand greatly in their own light, and may be regarded as obstructors of advancement in Pea raising and growing. It grows freely, has a robust constitution, a most prolific habit, and the pods are the largest and best filled of all, while the flavour is second to none. Last spring I had a few seeds direct from Mr. Culverwell and some from two different seed firms, and in all cases the above are the points which it showed most prominently. *J. Muir, Margam, S. Wales.*

CARTER'S INCOMPARABLE CRIMSON CELERY.—This grows with me from 18 to 20 inches high, thick, solid, and crisp, and has that rich nutty flavour so desirable in a good Celery. My experience of it is for a late crop, but doubtless it is all that can be desired for early work. Col. Clarke's Solid Red, and Leicester Red, both bolted with me three weeks back, for which I blamed the mildness of the season; but I lifted ten dozen of Carter's Crimson only last week not one of which showed any signs of starting to flower. This I take as conclusive that it is the very best variety I am acquainted with. *R. Gilbert, Burghley.*

THE MAZAGAN BEAN.—This is still quoted in many catalogues as an early variety, but it is a misnomer to term it such when compared with the Seville Early Longpod and the ordinary Early Longpod. That it is a hardy and free-bearing variety cannot be denied; but the truest Early Longpod is unquestionably the Seville, while for its dwarf growth it is a great cropper. Too much cannot be said in praise of this variety as an exhibition Bean, especially at shows held during the first and second weeks in July; it is the longest podded variety known, the pods often reaching a length of 1 foot or more. So great an advantage has this bean over any other on the exhibition table that a class for Longpods should be provided in schedules, so that the Windsor type may form a class of themselves.

Peaches and Nectarines.

The present time is a very busy one in this department, especially where there are a number of houses. The chief work in the early and second house for some time will be disbudbing, thinning the fruit, and heeling down the young shoots. Pinch in close any shoots at the base of which there are fruit, and which may be taken off after the fruit is ripe. A little manure-water may now be put in the evaporating troughs, to keep red-spider in check, and trees that have set a heavy crop will be very much assisted by being mulched with good rotten manure, and afterwards well watered with tepid water at about the usual temperature, 85°. Take advantage of bright sunny days to shut up early, allowing the temperature to run up to 75° or 80°, syringing the trees well backwards and forwards with tepid water, thoroughly wetting every particle of foliage, and always doing it early enough to allow the trees to get dry before night. Keep the night temperature about the same as already given. If treated according to directions given, the third house will now be in bloom, and the fourth close upon its heels. Fertilise with the brush daily, or, if the weather is dull, on alternate days will be sufficient. My bees are dead, from some cause or other, or I should have introduced them again, as they did me good service last year. As soon as the fruits are fairly set, give a thorough watering with tepid water. Proceed with cleaning and tying late houses, so as to get all finished as soon as possible; for with all the ventilation we can possibly give, if we have a continuation of mild weather the buds will be on the move directly. It has this season been sharp work to keep pace with them. *J. Wallis, Keele Gardens, Feb. 14.*

THE BEEKEEPERS' ASSOCIATION.—On Wednesday afternoon the annual meeting of this Association was held, under the Presidency of the Baroness Burdett-Cootts. The annual report stated that the number of members continued steadily to increase, the present total being 331. There is also an increase in the county beekeepers' associations in affiliation with the central society.

STOVE.—In this department the majority of the plants will soon be making good progress, being greatly aided by the unusually mild weather we are experiencing, whereby a nice growing, healthy atmosphere can be maintained without excessive firing. Give close attention still to the watering of newly potted plants; these should on no account be carelessly watered along now, or the evil results will be apparent during the summer.

STOVE BULBOUS PLANTS.—These are at all times valuable; many of them can be grown where other plants will not thrive. Alocasias are grand things when well done. These should be potted now before active growth commences. A. Lowii, A. Veitchii, A. Thibautiana, and A. metallica will thrive well in a compost of peat, such as one would use for Orchids, with the addition of some fair-sized pieces of charcoal, some sphagnum moss and silver sand—a good open porous soil suiting these kinds. A. macrochiza variegata will develop its variegated leaves to greater perfection when grown in a poor soil, in which loam predominates. A. Marshallii and A. Jenningsii may be treated like Caladiums. The stock of these latter plants should be gone through and repotted before they emit fresh rootlets. Remove all the old soil and dead roots from the bulbs, and see that no decaying portion of the old bulb is left on when repotted. For this purpose use a clean, sweet, open soil, with a good supply of leaf-mould and silver sand, and pot into rather small pots for a start; the most promising can later on be shifted into larger sizes as occasion may require. A batch of Achimenes and Tydeas should now be started. When growing these our practice used to be to separate all the stock entirely from the soil about now, and keep all that are not wanted for the first batch in sand until required to be started in their turn. Generas should be kept dormant a while longer yet, but any of the Gloriosas should be potted without delay to endeavour to get a good growth before they commence to flower. Pancratiums may be repotted, removing the offsets where this can be done easily. One good strong bulb of these is better kept singly. If several are grown in one pot together they generally come into flower at one time, which is not desirable, the flowers being short-lived. A better succession can be kept by growing each bulb by itself. In potting these plants a predominance of good loam should be used. Ureolina aurea may be grown under like treatment. Of bulbs thriving best in a temperate stove or intermediate house the Amaryllis stand in the front rank; those that are throwing up their flower-spikes should now be more freely watered. The flowers, when expanded, will be of greater substance, and the young growth succeeding the flower-spike will not become unduly elongated. Imantophyllums grown in the same temperature will soon push up their spikes; liquid manure will be beneficial to these occasionally. Haemanthus should be kept rather dry until signs of flowering appear, then treat them more liberally.

GREENHOUSE.—Keep this structure well ventilated in mild weather, and do not entirely close up at night unless signs of frost appear. All specimen hard-wooded plants that are wanted for late summer blooming should be retarded as much as possible; for this purpose a house with north aspect is invaluable. Plants of Pimelea mirabilis and P. decussata may be made to bloom in June and July by pinching out the points of the shoots during this month. Dracophyllum gracile may be treated likewise; the individual spikes will not be quite so fine, but extra numbers will help to compensate for that deficiency. Hyacinths intended for the latest bloom should be kept as cool as possible; they are unusually early this year, no doubt caused by the mild weather. Plants of the hardy Primulas, denticulata, and cortusoides amœna, are very pretty objects grown in pots for the greenhouse or conservatory, being distinct and attractive. These will soon push up their spikes, see therefore that they are watered freely. *James Hulson, Gunnersbury House.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Feb. 20	Sale of Imported Orchids, at Stevens' Rooms.
		Sale of Lilies, &c., at the Mart, by Protheroe & Morris.
TUESDAY,	Feb. 21	Clearance Sale at The Nurseries, Fitcham, S.W., by Protheroe & Morris.
WEDNESDAY,	Feb. 22	Sales of Imported Orchids, and Hardy Plants and Bulbs, at Stevens' Rooms.
THURSDAY,	Feb. 23	Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY,	Feb. 24	Sale of Roses, Hardy Plants, &c., at Stevens' Rooms.

THE annual meeting of THE ROYAL HORTICULTURAL SOCIETY, which took place on Tuesday last, did not appear to excite much interest among the Fellows, who, as the President remarked, reversed the ordinary rules, and flocked to the meeting when the Society was in adversity, but kept away from it when prosperity seemed returning. The report, too, from the Council was not of a very exciting character, and generally the proceedings seemed to indicate that the Council had the confidence of the Fellows at large. Lord ABERDARE repaired one omission in the report by paying tribute to the memory of the late Dr. DENNY, an ardent horticulturist and a good supporter of the true interests of the Society. He might well have gone further and alluded to the retirement of the late Treasurer, Mr. WEBB, who devoted much time most beneficially to the interests of the Society, and who, by his genial manner and generosity, endeared himself to all who came into contact with him. The retirement of Dr. HOGG from the post of Secretary should also surely have been mentioned. It will be remembered that he took office in troublesome times, when few would have been found willing to accept so thankless a position, and throughout he managed to retain the confidence of the horticulturists. His services during the troublesome litigation forced on the Society by the Commissioners must have been of no light kind. The new members of Council are all men in whom the horticulturists may fully confide as gentlemen devoted to horticulture and the legitimate work of the Society. To outsiders it would appear that Mr. HAUGHTON, to whose energy and zeal the Society owes so much, would as a business man have made an excellent Secretary. He, however, retains office as Treasurer, while Major MASON, an excellent horticulturist, fills the office vacated by Dr. HOGG. The only objection that can be raised to Major MASON—and in busy times it would be a serious one—is his residence at a distance from London. The number of Fellows is steadily increasing, the yearly revenue is improving, and the purely horticultural routine work at Chiswick and at the Committees is on the whole well done. That more is not done to raise the tone of the Society, extend its operations, so as to make it more truly an exponent of national and scientific horticulture, is due to two causes—one, the insufficiency of funds, and the other the absence of any competent head to manage and direct the whole Institution, and see that its higher functions are duly attended to. Under existing circumstances the supply of this deficiency seems to be an impossibility. The popular lectures and demonstrations of the Rev. GEORGE HENSLAW meet with very general approval; and we trust the Society may soon see its way to bring before the public his elaborate report on the effects of the late severe winters on vegetation. Such a report, carefully and thoroughly done, would be of very great value, and would do much to restore the influence of the Society in a department which, from force of circumstances, has been much neglected of late years.

The balance-sheet, as it stands, presents opportunities for unfavourable criticism, but we believe that the items which appear questionable are readily and satisfactorily explained, and that the great deficiencies under some

heads, and the large amounts under others are due, not to any real discrepancies, but to the manner in which it has been thought well to draw up and present the balance-sheet. It is a pity that an explanatory sentence was not added to the report to remove the impression which many must have had on a superficial perusal of the documents in question. Thus the small amount mentioned as paid in prize-money is simply due to the fact that by far the larger part has been paid since Christmas, so that really the financial statement, so far as the year is concerned, is satisfactory.

The Society appears to have been rather unfortunate in its dealings with the Sanitary Exhibition, and specially with the managers of the Smoke Abatement Exhibition, who, after occupying the arcades for some time, and killing or seriously injuring many of the noble specimens in the conservatory, announce a loss on their business of about £800, from which the prospects of the Horticultural Society in this connection appears the reverse of satisfactory. It is to be hoped that in any future negotiations of this kind the Society may be enabled to make better bargains than it has hitherto done.

As to the lawsuit hanging over the Society, it will be remembered that a decision in favour of the Society was obtained, but that this decision was appealed against with results not yet known, but which it is expected will speedily be determined. Till this matter is settled all attempts to get beyond the ordinary routine must of necessity be held in abeyance. On the whole, in spite of the sword of DAMOCLES which hangs over the Society, and the position and prospects of the Society are at any rate considerably better than they once were, and for this relief horticulturists owe their thanks to the present Council.

— BRICK KILLS.—At the late Gloucester Assizes, Mr. W. FOSTER, of Spillmann's Court Nursery, Stroud, sought to recover damages from a brickmaker on account of injuries to the plants in his nursery, alleged to have been sustained by fumes from the defendant's brickworks. The case is reported at great length in the *Standard Journal* of February 11, and is worth reading by all similarly circumstanced. For the present we can only mention the case, and hope to revert to it at another time. It must suffice to say now that the jury apparently thought either that Mr. FOSTER'S injuries were not severe, or that they were caused by some other agency, such as frost, rather than by the fumes of the brick-kills, seeing that they awarded Mr. FOSTER £1 damages only. We are informed that the Judge expressed his dissatisfaction with the verdict, and that an application for a new trial will be made in London. This being so, further comment would be inappropriate, but we may say without impropriety that the contention in the case lately tried turned very much on the question of the difference between the effects of frost or of noxious vapours on particular plants—a difference that in the main ought surely to be readily recognisable by experienced plant-growers conversant with local circumstances.

— BRAZILIAN BROMELIACEÆ.—MM. ED. MORREN and H. FONSNY have published a French version of the descriptions of the Bromeliaceæ discovered by Dr. WAUBA during the journey of the Princes AUGUSTUS and FERDINAND of Saxe-Coburg, preceded by a narrative of their travels, to which we may hereafter allude at greater length.

— THE RAISER OF MAGNUM BONUM POTATO.—MR. CLARK, a native of Christchurch, Hants, the raiser of this Potato, has fallen upon evil times, so that several gentlemen who know his sterling worth, and appreciate his labours as a successful raiser, are desirous of showing their sympathy in a practical form. Donations of £25 have been received from Messrs. SUTTON, others from LOUISA, Marchioness

of Waterford, J. K. WELCH, Esq., and others. Messrs. FRAMPTON & SON, Highcliffe, Christchurch, Hants, will receive further subscriptions.

— VEITCH'S "MANUAL OF CONIFERS."—The utility of this very serviceable book has been very considerably enhanced by the publication of a full index in place of the imperfect one before issued. As many persons may have obtained the book who are not known to Messrs. VEITCH, we are requested by those gentlemen to state that a copy of the index will be supplied to those who have purchased the book, on application to the Royal Exotic Nursery. With this addition the *Manual* becomes by far the most useful and accurate book of its class.

— MR. THOMAS MOORE.—In consequence of a misapprehension which appears to exist with reference to Mr. MOORE'S retirement, we are requested by him to state more explicitly that it is from the co-Editorship of this journal that he has recently retired, and not from the Curatorship of the Chelsea Botanic Garden, or the Editorship of the *Florist and Pomologist*.

— THE HORTICULTURAL SOCIETY OF SEINE AND OISE will hold its annual flower show at Versailles from Thursday, May 18, to Sunday, May 21, inclusive. It will take place, as usual, under a large tent in the park of Versailles, close to the Palace. This show is usually one of the best round Paris.

— EUPATORIUM GRANDIFLORUM.—From Mr. T. SMITH, of Messrs. RODGER, McCLELLAND & Co.'s nursery, Newry, we have received a specimen of this plant, which gives one a good idea of its character for conservatory decoration. It is bushy in habit, with large ovate, lanceolate, rough, coarsely-toothed leaves, and much branched terminal panicles of white flower-heads. Mr. SMITH writes:—"It is one of the best plants in flower here just now. The one sent is two years old, and it is unlike most of the genus, inasmuch as one-year-old plants do not develop the fine heads of bloom that older plants do. My practice is to cut them down after blooming, and plant them out in rich soil in the open ground at the end of May. I do not stop them at all, and lift and pot them in September. The plant is curious in another respect. After being housed in the autumn it requires to be carried right on slowly through the winter; if it is put in a cool-house in order to retard it the lateral spikelets never develop, and the terminal ones come miserably small."

— THE ARTHUR VEITCH MEMORIAL FUND.—It has given us much pleasure to learn from Mr. E. R. CUTLER that the committee of the Gardeners' Royal Benevolent Institution has received the sum of £800 14s. 2d., being the amount collected by the Arthur Veitch Memorial Committee to perpetuate the memory of that gentleman, and which, by the express wish of the Memorial Committee, has been placed to the account of the Pension Augmentation Fund.

— FLOWERS IN SEASON.—From Messrs. CRIPPS' nursery, Tunbridge Wells, we have received flowers of the old *Hamelis virginica*, and of the more recently introduced *H. Zuccariniana*, which appears to us to be very closely allied, if not identical with the plant figured by us some years ago as *H. arborea*, and which is not half so well known, as a winter-flowering shrub, as its merits demand. *Nuttallia cernitiflora* is also flowering freely, as well as double Lilac and white Primroses.

— THRIPS.—MR. TH. FERGANDE, 321, D Street, Washington, writes that he is making a study of the Thrips insects in their various forms, and is very desirous of obtaining specimens from all parts of the globe; and trusts that some of our readers, home and colonial, may favour him with specimens. These insects are very small, mostly vegetable feeders, and increase periodically, as gardeners and farmers know to their cost.

— SPORTING IN BEGONIAS.—In some of the Continental gardening papers it is stated that a gardener of Nancy has obtained several varieties in propagating *Begonia Contessa Ackermann*, according to the part of the plant employed. Thus, cuttings of

FIG. 34.—TACSONIA PARRITE : FLOWERS ROSY-ORANGE. (SEE P. 218.)

the stem produced plants bearing leaves of the same colour as the parent—that is, green suffused with red and dotted with white; whereas cuttings of the leaves produced plants bearing leaves not only more spotted but banded. Uncultivated developed in their centre several plants whereof one had spotted leaves and the rest had banded leaves. We agree with Dr. REUEL that this result requires confirmation. It was probably an accidental circumstance.

— DR. NEUBERT'S "DEUTESCHES GARTEN-MAGAZIN."—We have received the first number of a new series of this gardening monthly, now under the joint editorship of MAX KOLB, Inspector of the Royal Gardens, Munich, and Dr. J. E. WEISS, botanist. It has been enlarged, and it is to be more fully illustrated than heretofore. The present part contains coloured plates of *Nymphpha zanzibaricensis* and *Tilandsia Zahnii*. As far as the latter is concerned, the illustration is not very satisfactory. There are thirty pages of letterpress (large Svo), devoted to the various branches of gardening.

— THE FUNCTION OF LIME IN GERMINATING SEEDS.—Dr. LIEBENBERG has recently published, in the organ of the Vienna Academy of Sciences, the results of some researches on the part played by lime in the germination of seeds, from which it appears that there is a great number of plants of which the seeds require lime during germination, or the young plants die off from want of it. On the other hand there are plants that do not need this supply of lime in germination. Dr. LIEBENBERG further observes that the plants that die off in consequence of an insufficient supply of lime, do not die from the injurious effects of the solutions devoid of lime, but because lime is required in the nutrition of the plant. The author, however, was unable to determine with certainty the purpose of lime in plants, though he proved beyond doubt that the absence of it did not affect the formation of starch.

— THE KEW MUSEUMS.—In the wood museum is now exhibited a life-size painting, reaching from floor to roof, of the gigantic Aroid, *Conchallus Titanum*, which has more than once been alluded to in our columns (see p. 781, vol. x.). The two life-sized portraits of Malays bearing the spadix and tuber of the gigantic plant on a pole resting on their shoulders, and standing beneath the shade of the enormous solitary leaf, constitute a very striking picture, and appeal to the spectator in a manner that no numerical indication of feet and inches could do. In the old museum the Cryptogam collections have been advantageously and most instructively displayed; while the gallery executed by Mr. FERGUSON, at the expense of Miss NORTH, for the reception of her drawings of flowers, as numerous as they are extraordinary, is rapidly approaching completion. The memorial as to the formation of a rock garden has been so far successful that plans are under consideration how best to carry out the scheme, which when realised cannot fail to add to the attractions and increase the value of these gardens. The vitality and energy pervading this great national establishment are subjects for congratulation.

— PULMONARIAS AS POT PLANTS.—Gardeners who can force plants into flower *ad libitum* need scarcely trouble their heads about getting hardy plants early into flower, except such indispensable things as Hyacinths, Tulips, Crocus, Violets, &c. But there are a great many who have but a cold house on which to depend for a supply of plants, and anything that is early and attractive is of use to this class of gardeners. The varieties of Pulmonaria officinalis in the open border are pushing up their leaves and flower-stems, and if lifted, potted, and put in a cold frame or the cold house will soon display their beauty both of flowers and foliage, and they are equally of a high order. Some plants of what is known at Kew as *Pulmonaria saccharata grandiflora* that have been in pots all the winter in a cold house have already begun to flower, strong plants throwing up as many as five or six blooming spikes of pale red flowers, changing to blue as they age. The leaves, too, are rapidly developing, and when matured are handsomely spotted with grey on a whitish-green ground. All hardy plants of this character grown in pots for flowering in early spring should be planted out in a prepared bed after flowering, as if kept in pots in the house the foliage is apt to become infested

with red-spider. There is something akin to a feeling of liberty in plants so treated, as they make a free growth in good soil, and will bear division in autumn or when lifted for potting.

— EXHIBITION OF CANADIAN VEGETABLE PRODUCTS IN GERMANY.—Last autumn, as reported in NEUBERT'S *Deutsches Garten-Magazin*, an exhibition of Canadian cereals, grasses, fodder plants, fruits, &c., instituted by Dr. OTTO HAHN, was held in Reutlingen. The object of the exhibition was to instruct intending emigrants in the resources of the country and its advantages to those seeking a new home. The products were collected by four young German settlers—two gardeners and two farmers, and seem to have been of a very good quality. A collection of Apples is very favourably reported by the pomologist, Dr. E. LUCAS, who selects ten out of the fifty sorts, which he says are of superior quality, and at the same time excellent market fruit. These are:—Baldwin, Hub Davis, Iule Pearmain, Clula Beauty, Famous, Hubbard's Nonesech; ('Hubbard's non such'—? Hubbard's Pearmain) Irish Crofter, Northern Spy, Red Kombo, and Spitzenburg.

— HYGROSCOPIC PROPERTIES OF THE INVOLUCRAL LEAVES OF THISTLES.—A week or two ago we published a note on some hygroscopic plants belonging to the Composite, in which there is an incidental allusion to the hygroscopic properties of the involucre bracts of some of the Thistles. It will be remembered that the branches of the whole plant of *Asteriscus pygmaeus* and *Gymnarrhena micrantha*, under the influence of the drought that prevails after the flowering season close up over the flower-heads so tightly as to prevent the seed from being shed until the rains return, though driven hither and thither by the winds. These plants open and close repeatedly under the alternate influence of wet and drought. In some at least of the Thistles the involucre leaves surrounding the head of flowers close over the flowers or achenes in wet weather, and open in dry. Professor ROTHAY, of Vienna, as we learn from the *Gartenflora*, has been investigating this phenomenon, and he finds that the mechanism of the movement lies in a special tissue (sclerenchym) immediately under the epidermis of the under or outer side of the involucre leaves, which lengthens under the influence of imbibed moisture, and shortens when dry. How long the achenes usually remain enclosed within the involucre we are not told.

— LENGTH OF PINE CONES.—In a reprint of an article on Conifers, by Mr. STARKIE GARDNER, a statement that *Pinus excelsa* bears cones 1 to 2 feet long, took us so much by surprise that we have ascertained the length of the longest cones of several species of Pines in the Kew Museum, though of course we are not prepared to say that longer ones do not exist. The largest of the Himalayan Pine, *Pinus excelsa*, is 15 inches; *P. Lambertiana*, a North-west American species, is represented by a cone 10 inches long—the longest in that rich collection; *P. Grenvillei*, a Mexican species figured in the *Gardeners' Chronicle*, n.s., no. 1, p. 113, by one 15 inches long; and a cone of the Mexican *P. Ayacahuite* exceeds the last by half an inch.

— CURTIS'S FLORIDA PLANTS.—Botanists occupying themselves with North American plants have for some time past appreciated the excellent specimens prepared and distributed by Mr. A. H. CURTIS, Jacksonville, Florida. We now learn that the same collector undertakes to supply living plants and seeds of many of the most ornamental and interesting Florida plants. As many of these plants cannot be procured through the ordinary channel, some of our readers may be interested in this announcement.

— PEZIZA COCCINEA.—We were much pleased, a few days since, at Clifton, to see a basket containing beautiful specimens of *Peziza coccinea*, of which an orange-coloured variety has lately been shown to us, artistically packed in green moss, as a table decoration. We understand that it is frequently offered for sale in the market for this purpose. It is not the first time that we have heard of its being so used, indeed, we know of an instance where it was employed with such effect that a person present, charmed with its great beauty, became from that day a diligent student of fungi. The hint may prove a very useful one, for there are many species of equal beauty, though of

different habit, which could not fail if nicely disposed to attract admiration. Care should be taken to choose such kinds as do not lose their colour, and are free from any pronounced odour. Some of the more elegant kinds of moss, especially when in fruit, might make a very welcome addition. Fungi would then cease to be considered and despised as the exuviae of Nature, to be contemptuously trampled on or rejected. *M. T. B.*

— OUYIRANDRA FENESTRALS.—This singular plant is now to be seen in capital condition in one of the Orchid-houses in the collection of Sir Trevor LAWRENCE, Bart., M.P., Burford Lodge, Dorset. In many gardens considerable expense has been incurred in order to grow this plant, but even when the conditions thought to be most favourable to it have been obtained it does not always succeed. Here it is grown in an oval tub, containing less than a dozen gallons of water, and a few inches of sandy loam at the bottom. The depth of water is just 8 inches. The water is packed full of leaves, many of them a foot long, and very nearly 6 inches across. There is a constant drip of water from a syphon placed in another vessel on a higher level, and that is all the conditions. The temperature of the house is regulated to suit other Madagascan plants, such as *Angreecums*, &c. Mr. SYKES is to be congratulated on growing this interesting plant so well.

— THE PHYSIOLOGICAL LABORATORY AT KEW.—We are pleased to find that the resources of this, one of the latest additions to the Garden, are at present utilised to the fullest possible extent. Mr. BOWER has been investigating the structure and development of *Welwitschia*, and the results are memoirs which, like those of Mr. MARSHALL WARD on the development of the embryo sac, made in the same establishment, do honour to British science, and go far towards removing the stigma that original research in this department of botany is comparatively neglected in England. Such work will compare favourably with the best work in German laboratories. In the last-named country, however, such institutes may be counted by the dozen. Professor CHURCH is also at work in the Kew laboratory on the chemical history of the colouring matters of plants—a subject on which he has already published a valuable series of researches, and Messrs. CROSS and BEVAN are pursuing investigations into the life-history of plants in special relation to the formation and changes during growth in the last tissues.

— TESTIMONIAL TO MR. GEORGE BAKER.—On the occasion of the annual meeting of the members of the United Horticultural Benefit and Provident Society, at the Caledonian Hotel, Adelphi Terrace, on Monday evening, the 13th inst., the members presented Mr. GEORGE BAKER, of Coombe, with a testimonial of their esteem and gratitude on his resigning the office of treasurer of the Society after a term of office of something like twelve years. Mr. BAKER was one of the original members of the Society since its formation in 1866, and he has ever been an earnest worker in its interest. The testimonial, which was privately subscribed for among the members, and of the existence of which Mr. BAKER had no knowledge till it was placed on the table before him, consisted of a silver teapot, sugar-basin, and cream ewer.

— FICUS MINIMA.—This chaste little wall-creeper, which has withstood the severity of the past three winters out-of-doors in Mr. KINGHORN'S nursery, Richmond, will make a welcome addition to our stock of evergreen creepers for select situations out-of-doors. The plant in Mr. KINGHORN'S nursery has its roots under glass, but it can hardly be supposed that this protection to its roots will contribute in any way to the hardness of the plant, rather the reverse. The plant occupies an east aspect, and seems quite weather-proof. The little tiny leaves of the plant (it is much smaller than *F. repens*) are so numerous, and are so thickly set upon the stems, as to form a dense green covering, which would give many an unsightly wall quite a cheery aspect at all seasons of the year, and will be especially useful to architects for covering naked places about villa residences, where a great many things have to be done within a limited space. It may hardly be added that the plant clings like Ivy, or like its congener, *F. repens*, while it is much neater and more chaste in appearance.

— *ARALIA LEPTOPHYLLA*.—Those who have much experience in furnishing are only too well aware of the losses sustained by using tender stove-plants in anything like quantity during the winter months. All the *Aralias* are somewhat expensive, owing to the fact that they have to be increased by grafting, and are not very rapid growers. But, notwithstanding this, the stove varieties, such as *A. Veitchii* and *A. elegantissima*, are commonly employed for purposes of furnishing, much to the detriment of the plants, and without yielding any compensating effect in proportion to their value. The variety under notice is a greenhouse plant, and is therefore less liable to injury from a low temperature than the more tender stove kinds. The habit of the plant is much superior to *A. Veitchii*, its long narrow drooping leaves being both graceful and effective. Effect is really the point aimed at in furnishing, and if this can be produced equal to, if not better, by the employment of half-hardy plants, it seems anything but economy to use tender-leaved plants for no better reason than that they cost a higher price.

— *AUBRIETIAS*.—It is only where the *Aubrietia* is left pretty much to its own sweet will that we see it in all its beauty. When transplanted twice in the year for spring bedding, and often propagated by pulling to pieces, it is seldom seen in even decent form; and, indeed, is perhaps one of the worst plants that can be used for such a purpose. Still farther, it does not thrive well where the soil is flat and stiff, for there the moisture in the winter months lies about the roots, and not only injures them, but also provokes decay in the leafage. Under no conditions are *Aubrietias* seen in better form than when growing over rock or rootwork, or on sharp slopes where there is no stagnant moisture. One of the very best masses of the *Aubrietia* we have seen is where some plants are in an old tub sunk in the ground, and elevated about 9 inches above the surrounding soil. Some stones placed about on the soil amongst the plants keep the growth dry and healthy and in a perfect mass of greenery, and presently of flower, and where the growth to a length of 12 or more inches runs down over the sides of the tub, it is quite luxuriant, and shows how capital a plant it is for the covering of narrow slopes. In places where, as under trees, turf will not thrive, the *Aubrietia* might well be tried as an edging plant, provided that it was thus enabled to trail downwards in its most natural way. Strong growing kinds, such as *Hendersonii* and *violacea*, both rich dark coloured forms, and *græca* and *Campbellii*, paler ones, are the best for a free seeder, and reproduces itself freely. As the seed is ripe in June, if sown at once quite large plants may be got for planting out in the autumn, and then with natural cultivation a rich display of dark coloured flower is ensured. Where the growth is thus natural, robust, and unharmed by frost or damp, the bloom is much earlier and more enduring, in fact, makes a good show for three months' duration.

— *THE DOUBLE WHITE PLUM* (*Prunus alba flore-pleno*).—Few plants are more charming to look at or more delicate in appearance than the subject of this note, which is an old plant, not exactly forgotten, but rather neglected than otherwise, considering its claims upon horticulturists as an early spring flowering plant. The profusion in which its double white flowers are produced, and the extreme delicacy blending so beautifully with its tender green leaves, need only be seen once to be duly appreciated and admired by those who have not already included it among their lists of forcing plants. Arranged in conjunction with scarlet Tulips or red and scarlet Azaleas it has a fine effect.

— *CULTIVATION OF FIGS IN THE COLONIES*.—*The Colonies and India*, in recommending the cultivation of the Fig in some of our colonial possessions, points out that "Plantations have already been made in certain districts in Australia, but in all parts of that continent there is abundant opportunity for the extensive cultivation of the tree if only for the sake of its beautiful foliage in the treeless wastes in some portions of the interior. Of all the numerous varieties of Figs scattered over the tropical and temperate zones, there is none more easily cultivated, none more striking in appearance, and none more profitable than the *Ficus Carica*. Its fruits eaten green or sun dried are both palatable and nutritious, and the enormous

demand that exists for them is shown by the fact that the annual imports into Great Britain, chiefly from Southern Europe and the Levant, amount to over a thousand tons, while the United States import half a million dollars' worth yearly. According to the *New York Sun*, in Georgia, where the Fig bears two crops, an ordinary tree, six or seven years old, will produce 5 or 6 bushels of fruit annually, while twice or thrice that quantity may be expected from large old trees. There are trees in Eastern Florida that may be trusted to yield from 20 to 30 bushels of Figs a year. At Santa Barbara, California, it is said that a tree ten years old will bear about 500 lb. of fruit a year. In Alabama it is considered the most prolific of all fruit trees; and from Texas it is reported that the fruit succeeds perfectly all over the State. The tree is more hardy than is generally supposed, and if it will grow so well in tropical countries, and in the West Indies, in Fiji, throughout Australia and the greater part of New Zealand, in South Africa, in India—indeed, almost throughout our colonies and Indian empire, Figs ought to be a staple product. The ease with which the fruit is dried and packed is an important point in its favour."

— *CLOVE CARNATION MRS. LAZENBY*.—A good yellow self Clove is always acceptable, especially when in combination with a good habit. These two desirable characteristics are found in the variety under notice. It is, perhaps, more properly a *Picotée*; the flowers are large, well formed, of a good yellow colour, and it has, as already stated, a good habit of growth—in fact, a robust habit. Take *Courier*, scarlet; *Bella*, delicate blush; *Corsair*, rich deep purple; *Mrs. Lazenby*, yellow; *Eliza*, violet-purple; *Susan Askey*, white; and *Sybil*, beautiful bright rose, and we get a batch of beautiful varieties, good growers in the main, and most valuable for cutting from. It is easy to multiply these, but the foregoing gives a select collection to commence with, to which additions can be made as sterling varieties present themselves to notice.

— *KEISER'S KROON TULIP*.—This Tulip, which is of comparatively recent introduction, is a remarkably vigorous variety, and is an undoubted acquisition to its class. The flower is seen at its best before it is fully open. It is long, oval-shaped, rather a tall grower, and will be found in consequence to be a good variety for grouping with other spring flowers. The variety was sent out as being red and yellow, but the yellow is more of an orange, which adds to its merit and appearance. Mr. H. CHAPMAN has some good examples of it in flower in his nursery at Otland Park, Weybridge, Surrey, where it is highly spoken of as a showy variety, and is very effectively used in the show-house, where it has a conspicuous appearance, and quite bears out Mr. CHAPMAN'S eulogy of its usefulness for purposes of grouping.

— *THE WEATHER*.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending February 13, issued by the Meteorological Office, London.—The weather has been generally cloudy or dull, but towards the close of the period the sky cleared somewhat in the south and east, and at some stations the weather became very fine and bright. Temperature has been equal to the mean in "England, E.," but above it elsewhere; over Ireland and Scotland the excess was as much as 4° or 5°. The thermometer was highest on the 12th and 13th, when it rose to 57° in London, and to 55° or 56° at many other stations. The minimum reading for the period (28°) was registered at Collyumpton on the 7th. Rainfall has again been less than the mean in England, but in Ireland and Scotland the fall slightly exceeded the average. Bright sunshine was still very little prevalent, the percentages varying from 25 in "Ireland, N.," and 23 in "Scotland, E.," to 12 in "England, N.W." Depressions observed:—During the whole of this period the barometer has again been highest in the south-east part of our area, and lowest to the westward or north-westward. The wind has consequently been between S. and S.W., and generally moderate in force, but owing to the passage of some depressions it freshened considerably at times on our west and north coasts, and on the 9th, 10th, and 13th reached the force of a gale.

— *GARDENING APPOINTMENTS*.—Mr. WALTER DANCE, late Gardener at Llwyngwair, Pembroke-shire, has been engaged as Gardener to Colonel LOWE, at Gosfield Hall, Hlalestead, Essex.

THE KEW ARBORETUM.

THE OAKS.

QUERCUS BRANTII, Lindl., *Bot. Res.* 1840, App. p. 41, No. 74; Boiss., *Fl. Orient.*, vol. iv., 1173; Kotschy, *Die Eich. Eur.*, tab. xxxvi., fig. of leaves; *Penny Encycl.* xi., p. 213; *Acorns: Discoveries in the Ruins of Nineveh and Babylon*, p. 666; *Gard. Chron.* 1853, p. 263, fig.—Kurdistan.

This handsome and singularly interesting Oak, remarkable for its large acorns and leaves, which, when fully mature, measure 6 inches in length by 3½ inches in width, and when young are clothed with thick down, was first discovered by Mr. J. Brant, H.M. Consul at Erzeroum, in 1839. It was not, however, until some time afterwards that it was successfully introduced into this country by Mr. (now Sir A. H.) Layard. In these columns for 1853, p. 263, it is stated that the whole tenour of Mr. Layard's descriptions "points to the probability of the Kurdistan Oaks . . . proving hardy." If so, we may boast not only of having gained a new element of decorative gardening, but of having secured the very tree—the sacred tree—before which Sen-nacherib was wont to sacrifice; for it is highly probable that its acorns represented at p. 160 (*Discoveries in Ruins of Nineveh and Babylon*) upon a translucent cylinder supposed to have been the signet or amulet of that monarch, belong to no other plant than Q. Brantii."

In the *Gardener's Chronicle* for 1854, p. 691, in an article on the "Effects of the Previous Winter," the writer says, "the Kurdistan Oaks, especially Q. Brantii, disregard cold but do not like such frosts as those of April 24, which are in fact too much for any tree whatever in full leaf." This species was grown at Kew many years ago, but at present seems to be wanting in the Oak collection. The name is to be found in some catalogues, and it is possible that good plants of it exist in this country; will any one possessing it kindly state particulars of size, &c., for the benefit of all who are interested in hardy trees? It may be as well to add that a different plant, which I have not yet been able to determine satisfactorily, is grown in some Continental gardens under the name of Q. Brantii.

Q. COCCIFERA, L., *Loud., Enycy. of Trees and Shrubs*, p. 833, figs. 1617, 1618; Kotschy, *Die Eichen Europa's und des Orients*, t. 29; J. D. Hooker, *Trans. Linn. Soc.*, vol. xxiii., tab. 37.—Along the Mediterranean from Portugal to Turkey, Asia Minor. The Kermes Oak.

A shrub a few feet in height, now and then assuming the character of a tree, with a trunk from 1 to 2 feet in diameter. The largest specimen at Kew is one about 9 or 10 feet high, with a compact head about 7 feet through. The species is a very interesting one, with small dark green rigid leaves, like those of a Holly in miniature. "It is celebrated as being the haunt of the Kermes insect, which yields so brilliant and permanent a blood-red dye that the old Flemish tapestries dyed with it two centuries ago have lost none of their brilliancy" (*Penny Cyclop.*, vol. six., p. 213). For the manner of collecting Kermes and many interesting particulars see *Loud. Arbor. et Frut. Brit.*, vol. iii., p. 1908. According to Aiton Q. coccifera was cultivated in this country so long ago as 1683.

Q. ALNI-FOLIA, Poeh., *Enumer. Pl. ins. Cypr.*, p. 12; Kotschy, *Die Eichen Europa's, &c.*, t. 6; *The Garden*, vol. xviii., p. 486 (fig.). Q. *Cyprici*, Jaub. et Spach, *Illustr. Pl. Orient.*, i., p. 110, pl. 56; Boissier, *Flores Orientalis*, vol. iv., 1168.—Native of the hills of Cyprus.

This is quite a recent addition to British gardens. Its principal charm consists in the bright golden tomentum which clothes the under-surface of the small Alder-like leaves. As the snow persists for more than a month where this Oak grows it seems not unreasonable to expect that there may be many spots in the British Isles where it would flourish in the open air.

Kotschy states that the acorns are collected by the monks of the Greek convents, dried in the air, and then stored for mixing with the food of their domestic animals during winter.

Q. DENSIFLORA, Hook. and Arn., *Bot. of Beechey's Voyage*, Suppl. 301; Hooker, *Journ.*, tab. 380; Nutt., *Sylvia*, 1, ii., t. 5. *C. chinensis*, Torr., *Proc. R. Soc. Phila.*, 137, t. 19.—California.

Varying from a mere shrub from 5 to 7 feet high, to a pretty large tree, 50 or 60 or sometimes even 80 feet high. In foliage not unlike some of the forms of *C. lucida*. This has stood fairly well in the open at Kew without protection for some years. Even during the winters of 1870-80 and 1880-81 only the young unripened shoots suffered from the cold.

Q. PHYLLIROIDES, A. Gray, *Bot. of Japan*, p. 406, in *Mém. of Amer. Acad. Arts and Sciences*; DC., *Prod. Arb. vni*; Mast., *Gard. Chron.*, vol. 1, 1874, p. 362.—Japan.

A pretty evergreen Oak, which has done well in the open at Kew without protection for some years. Foliage not unlike that of some *Phyllireas* such as *P. media*, &c.

SALISBURY PALACE.

THE episcopal residence is situate within 400 yards of the city market place, and adjoining the cathedral. It is an extensive and picturesque building, in the Tudor style, and the gardens and grounds cover an area of 15 acres, nearly three of which are walled-in kitchen garden, and in which are situate the glasshouses, pits, sheds, and the head gardener's house, the latter abutting on Exeter Street, whence there is a private entrance. In the kitchen garden, which is exceedingly clean, well cultivated, and judiciously cropped with winter and spring vegetables, are also grown the hardy fruit trees of the kinds usually met with in such gardens. There is not much glass here—a few small vinerys, plant stoves, hot-water pits and cold frames, and some of these were gay with *Primulas*, especially fine and attractive being Williams' *P. alba* magnifica, the individual blooms of this variety being nearly 2 inches across, with a well-defined-yellow eye, and beautifully fringed; *P. Chiswick* Red, another of Mr. Williams' varieties, a crimson-scarlet, making a striking contrast with the *alba* magnifica, but apparently not so robust and free-flowering a habit as the latter. Mr. Smith, the persevering and intelligent gardener here, has a promising strain of his own, which he is still endeavouring to "improve."

In the plant stoves, which were filled with plants of an ordinary though useful description, I noticed a couple of nice plants of *Adiantum trapeziforme* and *Fegonia Prince Wallenstein*, the latter a very useful ornamental foliage and flowering variety, and not so much grown as it deserves to be, the young leaves and stems of which have the appearance of crimson velvet, and, with the white flowers, which are shaded with pink, are strikingly effective and greatly admired. A plant of *Passiflora racemosa*, in flower, depending from the roof, is also deserving of passing notice, as also is a well-flowered batch of *Marie Louise Violet*, which are planted near the glass in a three-light frame, situate at the sunny side of a high, well-trimmed New hedge, of which there are good examples on either side the principal thoroughfare in these interesting gardens.

The flower garden, which is divided from the small park, in which is a nice sheet of water, by a ha-ha and stone balustrade, is situate immediately opposite the south front of the Palace, against the walls of which are growing some good examples of *Magnolia grandiflora*, *Wistaria sinensis*, *Pomegranate* (*Punica granatum*), *Myrtles*, *Passiflora cærulea*, and *Roses* in good condition. Several nice specimens of Irish Yew (*Taxus fastigiata*) occupy central positions in some of the circular beds within a few yards of the Palace walls, and a small fountain adjoining the balustrading is not the least interesting feature of the place, which historically and naturally is full of interesting matter.

In the grounds, which extend north, east, and west of the Palace, are several fine specimens of the Cedar of Lebanon (*Cedrus Libani*), fine bushes of English Yews from 9 to 10 feet high and 15 feet through, and sundry fine specimens of *Ulex* dot the greenward between the tall Cedars, *Dunus Lanlettiana*, &c. In the midst of these lofty evergreen trees show conspicuously and somewhat strangely the branches of a fine specimen *Plane* (*Platanus occidentalis*), which at 4 feet from the ground measures 11½ feet in circumference, and had shed its bark pretty well from every branch. In conclusion, I may be permitted to add that several *Fig* and *Magnolia* trees are trained against the back of the cloister wall at the garden side, and between the huge buttresses which support that lofty wall, and which protect the trees from the force of the east winds. The good keep of the whole place reflects not a little credit upon Mr. Smith, who evidently understands his duties. *Tourist*.

FRUIT NOTES.

Late Pears.—A recent correspondent complains that there are so few late Pears worth growing, and that the nurserymen do not offer any variety. I would suggest that the difficulty lies not so much in the direction of obtaining the fruit as in keeping them. Very few fruit-rooms are competent to preserve Pears in good condition to their proper season, and the recent summer-like weather, and wet and unkindly autumns, have not brought the fruit into a proper condition for storing. In 1881 there was both too much wet and too little continuance of good gradual ripening weather; a sudden drought, combined with an acceleration of solar heat, does not appear to produce that mellow flavour which is so much desired, while a sunless summer produces fruit that may be large, but it seldom ripens under such conditions, as witness the *Beurré d'Ananlis* Pears shown at the January meeting of the Fruit Committee in 1880 by that good Pear grower, Mr. Goldsmith, of Hollands, Tonbridge. Now, if a gardener finds he cannot keep his ice, means are soon taken to remedy any apparent defect in the store, and if he cannot command the required heat for forcing, more pipes are added to the boiler, or those already in use are rearranged. If, then, late Pears are of any value at all, why should not the fruit-room be looked to and overhauled? Any sudden alteration of temperature, such as causes the fruit to sweat, is injurious, and should be guarded against by extra thatch—two outside mats, if one does not answer; and let the coming summer-time, when the fruit-room is not required, be utilised to set these matters right. Taken from a list at hand all these late Pears are good—not, perhaps, all in one season, but they may be depended on generally. Let some be tried on walls as young trees, or grafted on old ones—others as cordons, or pyramids, and on both Pear and Quince; and, excepting the accidents of season, the gardener may hope to have some English fruit to place on his employer's table at a time when its rarity will forbid too close criticism.

Pear Knight's Monarch.—I can endorse all that Mr. Morgan has said both for and against this Pear. When it does attain maturity it is the *me plus ultra* of all Pears, but unfortunately that has not happened above six times for the last thirty years here. In most cases it drops its fruit not only early but prematurely, consequently they become withered and shrivelled, in fact of no use at all. I have found such the case in wet and dry seasons alike. The trees here are worked on the Pear stock, grown as pyramids, espaliers, and on walls, and all are alike, the trees are healthy and bear fair crops yearly to no purpose. *Paecl. Lundsdan, Blenheim Hall Gardens.*

Dessert Apples.—I do not think I am far from wrong in my estimate of the good qualities of the King of the Pippins. I want to point out both to Mr. Carmichael and to Mr. Culverwell that in the selection of six dessert Apples I gave I had in view sorts that are usually fit for table and for exhibition at the same time; but, of course, freely admit that there are others quite as good that have different seasons. There is Old Red Quarrenden, Early Harvest, Irish Peach, and Kerry Pippin, in their early season all first-rate, but their season is a short one. Then coming on till now there is the old Cockle Pippin, a most delicious Apple, one of the best dessert kinds we have. Winter Pearmain, fine and good; Royal Pearmain, Sturmer Pippin, and others, all first-class late season kinds; but none either of early or late give us such handsome samples as do the kinds I have before mentioned as good mid-season sorts. I have Lemon Pippin, so much praised by Mr. Culverwell, and I grew it as good samples in South Hants some years since, but I never thought it good. The flesh always

has seemed hard before the fruit was really ripe. Perhaps it does better on a cooler soil. Apples, like Potatoes, vary very much in size and quality on diverse soils, and in our discussions it is well to make full allowance for that undoubted fact. Then Mr. Culverwell does not think much of Blenheim Pippin as a dessert Apple, but curiously enough it is the most popular dessert kind in the London market. Perhaps Mr. Culverwell will say "So much the worse for the Londoners;" but then opinions differ. All Apples are not Ribston Pippins of course, any more than Medoc wines are the Chateau Lafites, but then many have various good qualities none the less. *A. D.*

HOME CORRESPONDENCE.

Senecio spathulifolius.—For thus I spelt the name in the MS. of my paper in the *Journal of Botany*. It is derived from Gmelin, who spelt it *spathulifolia*. That I ventured in my *Manual*, ed. 8, to alter into the more correct form with an *z* in place of the *s*. Linnaeus and Smith would also have spelt it so. Plants of it kept sheltered from the weather, in a very cool greenhouse, have at this season enormous buds or rather rosettes of leaves of a cordate-spatulate shape, quite covered with most beautiful arachnid fibres. It is of much interest to trace the changes in the plant from these leaves to the long leaves usually found at the base of the stem in the summer even on seedling specimens. These winter leaves seem to be quite unknown to botanists, as they are not noticed nor figured anywhere, as far as I can discover. *C. C. Biddings, Cambridge, Feb. 11.*

Ants in the Peach-house.—In a Peach-house here the trees from which I have taken heavy crops of fruit annually for some years past this season had the blossoms attacked and destroyed by ants in a remarkable manner. Until this season I had always looked upon the presence of ants in the house in question as of little or no importance; their chief occupation seemed to consist of running up and down the stems in search of the excrement from the black-fly, with which the trees were infested, and which I failed to extirpate until last autumn. My attention was called to the subject while fertilising the blossoms with a camel-hair pencil. I found all the earliest blossoms minus the pistil, and upon closer examination I found they had been eaten off just above the ovary, and lay shrivelled up among the stamens, while an ant was in the cavity of the flower, the object being to make an entrance. In a few instances I found an entrance made by eating through the flower at the base of the stamens, and the pistil uninjured; but in all cases the predator was inside. I have arrived at the conclusion that by annihilating the aphid I had deprived the ants of their natural food, and consequently they attacked the blossoms for the nectar they contain. So thoroughly had they done the mischief that had I not discovered it in time I feel convinced the crop would have been destroyed. I immediately took steps to stop their coming by wrapping several folds of brown paper round the stems of the trees, upon which was tied a roll of cotton wadding that had been steeped in paraffin, which proved an effectual barrier. I then put a man to destroy all the ants he could find upon the trees, and in a few hours the trees were rid of this (to me new) enemy. I should be glad to hear if any of your readers have had similar experience. However that may be, I cannot any longer look with indifference upon the presence of ants in a Peach-house. *Horace Woods, The Gardens, Maindy Park, Abercromby.*

Sisyrinchium grandiflorum.—I send you a clump of this charming early-blooming plant, to show how well it does in our stiff, holding soil. Quantities of it now make a fine appearance. *Z. Smith, Newry.*

Potatoes to Grow.—A great number of gardeners throughout the country are expected to produce, among other things, a continuous supply of Potatoes. This rule is in force here, and to grow a sufficient quantity we usually plant from 2 to 4 acres. Being anxious to grow most new sorts having high characters we for some seasons planted a host of varieties, with this result, that in consequence of disease and other evils weak constitutioned sorts are subject to our supply generally became exhausted some considerable time before we could reasonably expect to dig and renew our stock. This state of things induced me to select as sorts to be raised upon four or five kinds which would give us a large supply the whole year. After testing various sorts our choice fell upon the following:—Ashleaf and Lapstone Kidney for the garden, Scotch Champion and a limited quantity of Magnum Bonum and Beauty of Hebron for field cultivation. We selected the Champion principally

because our field Potato ground is of a poor chalky nature, and as we grow for quality we use little or no manure at the time of planting, consequently the tender sorts fail, whereas the extraordinary constitution of the Champion enables it to grow and bear a crop of the highest quality. Since adopting the practice here stated we always have had Potatos and to spare. *A. L. H.*

Cinerarias from Seed.—What can be got out of a pinch of seed? I ask the question because last spring I bought a 2s. 6d. packet of seeds, as I had given up growing the named sorts, as to me they were a great trouble, and took up much useful room after they had bloomed which could have been used for other plants that were useful. I found many of the named sorts very weak, and they would not start into growth satisfactorily, now with my seedlings I have no trouble, I sow the seed early in March, and out of my pinch of seed I believed every one germinated, so that for 2s. 6d. I got four times as many plants as I wanted. These I took up little room or care until August and September, and at my disposal they were put into pots for flowering. They were first sown in pans not too thickly; when they were strong and fit to handle, they were potted into very small pots, and grown on in a very small space, the greater part of the summer. Now the plants are nicely in bloom I have no reason to regret discarding the old roots, for the blooms are as the packet described "superb," the colours various and everything I could wish for, some of the flowers measuring 2 inches across and of great substance, and the culture is so simple and so certain, that I would recommend all who want Cinerarias for bloom to grow them from seed; they grow in good soil, and require frequent watering with weak manure-water, a cold frame suits them best with the lights removed morning and evening, giving a light shade in bright weather. The seed should be lightly covered with soil and not watered for a few days after sowing. Cover with a bell-glass, and shade the pans; in this way every seed of mine germinated. *William Cutbush, Thorpe Perrow.*

Sedum acre aureum.—This beautiful Sedum deserves to be better known and more extensively grown than it appears to be at present, judging from the fact that we seldom meet with it in gardens, and yet when seen during the winter and spring months it never fails to excite admiration, the light green groundwork and the golden tops of the shoots being very effective. We have it now in its summer quarters in our flower garden, where it makes a striking contrast with the green and silver leaves, and among the raised patches of it, in company with *Aubretia purpurea*, have a very telling effect among the rock plants. This, like most of the other Sedums, is very easily propagated—a handful of it "minced" up and scattered over a piece of border with, or without, a little fine soil strewn over it; roots freely any time from April to October. *H. W. W.*

Luculia gratissima.—In the Camellia-house here, which is 95 feet long, 24 feet wide, and 21 feet high, there is a splendid plant of *Luculia gratissima*, 14 feet high, and to feet through. It has been planted at least thirty-five years in a raised border amongst Camellias. Owing to the large dimensions of the house, fire-heat is scarcely used save to exclude frost; indeed, in the winter of 1880, when the thermometer fell 2° below zero on two occasions, and when day after day the thermometer ranged from 20° to 30°, it could not be kept much above the freezing-point, yet the *Luculia* flowered better than usual, the blossoms being fine, scores of them measuring 6 to 8 inches in diameter. The Camellias are a speciality here (and the great majority of the plants are well furnished from the ground to the apex), and all other occupants of the house, whether permanent or temporary, are treated in the same way. The mildness of this winter precludes the use of much fire-heat; indeed, the house is kept as cool as possible in order to retard the Camellias, yet the *Luculia* is flowering fairly well, producing a flower almost at the point of every shoot. I may also add that, as a matter of course, when the Camellias have finished their growth, all the ventilation possible is given to the advent of frost. Gentlemen who are accustomed to travelling from place to place, assert that it is the best specimen of the *Luculia* they have seen, although they have seen it grown apparently under more congenial circumstances. When it has finished flowering its shoots are cut back to about three joints of last year's growth, kept rather dry at the roots, and well syringed. I find by thus treating it that it makes satisfactory progress. Am I right or wrong in shortening back the shoots, as I have been informed that it is considered wrong to cut back *Luculia* shoots—even that it is injurious to cut the flowers off? Of course, if it is desired to extend the plant as rapidly as possible in certain directions. I do not shorten the shoots much till that object is accomplished; still, I maintain that the use of the knife is in no way injurious to the well-being of the

Luculia by merely cutting back its shoots. *Thomas Lloyd, Spring Grove Gardens, Beaulieu.* [You are right, of course, in judiciously cutting the shoots back. If you did not do so, the tree would grow out of all bounds. *ED.*]

Garden Mice and How to Trap Them (see p. 119).—The "Perpetual Mouse Trap" is decidedly the best and most simple, yet ingenious contrivance that I have ever before seen for the catching of these troublesome garden pests. It is about 12 inches long, 3 inches wide, and the same in depth. The sides and bottom are made of thin boards, the ends of wire, mangle-rib, and the top glass, through which shows the Wheat with which it is baited) fixed in a framework on either side the depressed entrance, which is in the centre, about an inch wide, extending across the box, and a little more than half its depth. On a level with this entrance is a balance-board with an upright partition in the centre, and which, when a mouse treads on it—whether it has been attracted by the bait—is completely imprisoned in that division of the trap, and while being thus caught sets the one in the adjoining compartment for the next arrival, which is necessarily on the opposite platform, and so on, each mouse caught setting the trap in the adjoining prison for the next one, which on finding itself a prisoner makes its way through a wire contrivance, and through which it cannot return, to the light which is admitted through the wire end of the trap, which bars its further progress. These traps, as already stated, are always set, and require no fresh baiting, inasmuch as the latter is as far out of the reach of the mouse when inside the trap as it was when outside, provision being made in the bottom for removing the mice. One of these traps is capable of catching ten or twelve mice in one night. We keep several of them ourselves all the year through in our flower garden and grounds under the Yew hedges, in the Rhododendron and flower beds, &c., where during the last five or six weeks we have caught nearly as many dozen mice. The grass mice, however, are very shy of them, and as they have occasionally caught them by baiting the traps with water, but not with cheese or flowers they had directed their attention to. The inventors of the "Perpetual Mouse-Trap" are Messrs. Colin, Fullinger & Sons, and the sole wholesale agents, Messrs. S. & E. Ransome & Co., 10, Essex Street, Strand, London. *H. W. Ward.*

—We have been very much troubled with mice here this winter. Field and house mice attacked our earliest sown Peas, which were meant to kill by the figure-of-four trap baited with toasted cheese. Our Tulip and Crocus bulbs are completely destroyed by the field vole, which we have been unable to trap, although we have used a number of the same traps, some baited with cheese and others with Peas and Beans. *H. H.*

Teopelia cyanocrocus.—After several failures I have at last succeeded in blooming two out of three bulbs of this lovely Chilean plant, for which I am indebted to the kindness of Mr. Max Leichtlin. I thought at first it would, like the *Tigridia* and *Nemostylis geminiflora* prove very fugacious, but this is by no means the case. One flower has remained expanded for four or five days, though it has been kept in a hot room with the window only open for a few hours every day. The lovely blue colour of the petals, almost exactly the same hue as *Genetia aculis*, is set off to perfection by the white eye at their base. The pot in which the bulbs are planted has been kept during the winter in a cool greenhouse, close to a window always open in the day time except during severe frost. *H. Harpur-Cress, Drayton-Beauchamp, Tring, Feb. 13.*

Double-flowered Auricula.—I have a few plants of a double white variety that I have obtained from a specimen I got from M. Louis Van Houthe, of Ghent, some four years ago, at a cost of 5 fr. It has mealed foliage, but is not a good grower, perhaps because I have treated it a little unskilfully. The flowers are not fully double—no nearly so double as those of purple and other fine varieties I have; and the colour is creamy rather than pure white. It throws up a strong truss of flowers. I hope to be able to exhibit it in the coming spring, when perhaps its identity with the form mentioned by Mr. Duncan Murdoch on p. 192 may be determined. The flowers of my double white are fairly well perfumed. The hard winter of the early part of 1881 had affected my double Auriculas, and they are only just recovering from its effects. *Richard Daint, Ealing, W.*

Ice Storing in Sawdust.—The antiquity or otherwise of the practice of preserving ice out-of-doors in sawdust is not a question which need take up much of your space. Mr. Ward tells us, however, in the *Gardeners' Chronicle* of January 8, 1876, that he used it then, a few inches in depth, on the surface of the ice, and over that 2 feet of leaves, and a covering of litter. Some of the correspondents who took part in the dis-

cussion then, say they knew of sawdust being used for covering ice many years before that time. Mr. Inglis mentions its being used at the Hurburton House in 1863. So bear in mind the priority of the practice, which probably dates much further back than that time, if we only knew where to lay our hands on the records. Ice stacks covered with various materials, such as straw, leaves, turf, &c., were common enough in Loudon's time, but they do not seem, notwithstanding their cheapness, to have become very generally adopted as a means of preserving ice. That has been no doubt due to their uncertainty. It was nothing unusual to bear on the ice stack in one situation and find it keeping ice fairly well some distance, while another stack, made on the same principle, and in another locality, turned out an utter failure. Mr. Ward kindly informs me and your readers generally that it is not necessary to incur the expense of excavating pits, &c., in order to have a supply of ice all the year round. Mr. Inglis says stacks aboveground will answer the purpose quite as well and of course cost less. If anything will preserve ice, above or under ground, I think the best sawdust will, but my experience on this aboveground is, that it does not keep nearly so well as in a sawdust pit, lined with wood, as described in the *Gardeners' Chronicle* for January 14 of the current year. I worked this question out for myself in 1874, 1875, and 1876, with stacks of ice, principally aboveground, before incurring a farthing of expense in the making of a sawdust pit. The results may be interesting to those who have not the opportunity to test the matter for themselves. In December, 1874, we stored 150 loads in a stack, and covered with wet sawdust; this furnished supplies till about the middle of October, 1875. In December, 1875, we stored 200 loads in the same way, which yielded supplies for season 1876 up to October 23, when the old ice-house had to be resorted to, to continue the supplies into November. These results, while better than those obtained by using leaves, straw, &c., seemed still to leave considerable room for improvement. It occurred to me, therefore, to get three-fourths of the bulk below the ground level, in a thoroughly drained, wood-lined pit, that the ice would be easier managed in every way, better isolated, and less influenced by atmospheric changes than in a heap aboveground. It is true that a pit cannot be excavated, lined with wood, and thoroughly drained for nothing; but results often justify a little initial expenditure. It was so in this case. We generally finish the year with seventy or eighty loads at least to the good now after meeting all demands, besides saving the expense of filling the old ice-house, and that is worth something. While on the question of initial expenditure I may remark, for the comfort of Mr. Ward, that if an annual saving is thereby effected a few pounds once for all may be well spent. As an instance our freezing ponds were fully half a mile distant from the ice store. We spent a few pounds in making two natural depressions in the park, close to the store, available for flooding in winter with a view of procuring a good sheet of ice close at hand. The result is that we get a large supply of ice run in, in exactly half the time we used to require, and that, too, with less labour and fewer carts. Where the ice can be got close at hand, and carts keep coming in rapidly, the advantage of a pit will be apparent, as the ice can be sent out of the carts directly into the pit by its own gravity, there to be spread about and broken. Were 200 to 250 loads to be built up entirely aboveground, and supposing there was no valley handy, as in Mr. Ward's case, to admit of the carts being taken to a higher level, I am afraid the annual expense would be something considerable, and the height of the heap would be something for the workmen to remember by the time they had got the last load to the top. *D. Melville, Dunrobin Castle Gardens, Sutherland.*

Winter Acacia as a Pot Plant.—This is a particularly pretty little plant grown in pots for conservatory decoration, and one that associates well with Crocuses and Snowdrops. It flowers freely if treated in the same manner as Crocuses for pot culture, plunged after setting in cocoa-nut fibre or some such material till the roots are well up through the soil, when it will soon come into flower in a cool house near the glass. *H. H.*

Setting of Peaches.—Complaints are often made regarding the dropping of Peach-buds when they begin to expand, and when such occurs it is very tantalising, and the loss is a serious matter. Numerous reasons may be assigned for such misfortunes: over-cropping the season previous, especially when trees are not vigorous; dryness at the roots (often this is the case when it is least suspected by the surface being wet, and perhaps a foot or more downwards, when the feelers may be feeling dry at a depth not reached by moisture); fire-heat judiciously applied is most destructive to Peaches in their early stages of growth. But there is another evil very common, and not generally suspected, viz., crowding of buds. When a tree becomes thoroughly ripened buds are very abundant, and far too much for the

strength of the tree to combat with—its smother each other, and become so thoroughly delimitated that setting is almost impossible; all the manoeuvres to circulate the pollen and do justice in every respect are of no avail. For about twenty years past we have thinned the flower-buds unsparingly, allowing them to stand quite clear of each other, and leaving those best placed to receive light and air, as well as to be in the best positions when the fruit swells. During many years we have had to set the fruit in January or February, but do not remember at any time seeing buds drop, and crops have always been abundant. When the fruit-buds are being thinned we, at the same time, reduce the wood-buds, which are then just perceptible, often using the point of a sharp knife to pick them out, and when the work is finished all the wood not wanted for next season is disposed of; one is left to top each shoot and lead up the sap, and another at the base for next year's duty, and except a little topping and tying no further trouble is necessary with the current year's growth, we therefore make our Peach crops very inexpensive so far as labour is concerned. But the conditions to secure unflinching success in setting is abundance of fibry roots, matted not far from the surface, in thoroughly firm but porous soil; under such circumstances, abundance of fresh air, thinned off and heavy crops always ripened. A.

Reports of Societies.

Royal Horticultural: Feb. 14.—At the annual general meeting, held on Tuesday, there was but a small number of Fellows, and the proceedings were of but short duration. The President, the Right Hon. Lord Aberdeen, occupied the chair, supported by the following members of the Council:—Sir Trevor Lawrence Bart., M.P., the Rev. H. Harpur-Crew, Mr. G. F. Wilson, Mr. G. T. Clarke, Colonel Trevor Clarke, Major Mason, and Dr. Hogg. The minutes of the last annual general meeting having been read and confirmed, Dr. Masters and Mr. John Lee were appointed scrutineers of the ballot. The names of thirty candidates for the Fellowship of the Society were next read, and the whole unanimously elected. The following report of the Council for 1881 was then taken as read:—

ANNUAL REPORT, 1881.

The Council have again to congratulate the Fellows on the increase in their numbers and in their income, which the past year has shown, and the more so as such increase has for several years past been progressive in both respects. The receipts from the Great Show again stand far in advance of any similar gathering, the effect of the brilliant display made by the exhibitors and seriously affected the attendance of the public. The loss entailed thereby upon the finances of the Society fortunately was small, and the evening *fête*, which gave great satisfaction, cost more than the usual amount of its expenses. The promenade shows in the conservatory, which are steadily growing in the public favour, did not in any way interfere with the scientific work of the fortnightly committee meetings, of which they were an extension. They have been a source of enjoyment to the Fellows and their friends who attended them, and have contributed large and attentive audiences at the interesting lectures delivered at them, some of which have been published *in extenso* in the Society's *Journal*. The other minor shows, including those of the Auricula and Pteridophyte Societies, met with their usual high standard of excellence, and afforded much pleasure to visitors. The lawn tennis courts have been much used and appreciated by the Fellows resident near the South Kensington Gardens.

The International Medical and Sanitary Exhibition, for the purposes of which the Council granted the use of a part of the grounds of the Society, proved a success financially, and, the Council trust, has been useful to the nation, by teaching in a visible and practical way the leading principles of sanitation and the best external means of preventing and alleviating disease. The Council wish to record their sense of the cordial and pleasant nature of their relations with the gentlemen who represented the executive committee of this exhibition.

The Smoke Abatement Exhibition, which is still in progress, will, the Council hope, effect practical good in the inhabitants and destruction of plants which smoke occasions in and around our great cities, towns, and manufacturing districts.

The Council have no doubt the aid they have given to the laudable objects of these exhibitions will have the approval of the Fellows.

The suit by the Commissioners of the Exhibition of 1881 against the Society and the debenture holders, the position of which was fully explained to the Fellows in this year's report, was referred to Mr. Justice Fry in January last, and was, after hearing, dismissed with costs, to be paid by the Commissioners to the Society, and to the representative of the debenture-holders. Against

this judgment the Commissioners have appealed, and the Council believe the appeal will very shortly come on for hearing. If the decision of Mr. Justice Fry be affirmed, as the Council have reasonable grounds for hoping will be the case, the Society will be placed in a much more advantageous position than it has occupied for many years.

The scientific work of the Society has been carefully attended to during the year.

The Chiswick Garden has been maintained in a high state of efficiency, and has enabled the Council to have much useful experimental work carried out there. In this work the Fellows appear to take an increasing interest, and the public generally receive as authoritative the results which have been attained.

The Fruit Committee have had under examination 242 different sorts of Potatoes, and from America a number of unnamed seedlings. The season proving favourable for these, the experiments were very successful, and the committee were enabled to recommend seventeen varieties for the Society's certificates on account of their improved quality and appearance. Some new Peas were also grown, and of these three kinds received certificates. There were also many minor varieties of vegetables which received attention.

The kinds of Raspberries in cultivation being numerous, has been thought desirable to institute a trial to ascertain their respective merits and character. With this view a large collection has been secured, and the result of the investigation will, when completed, be published in the *Journal*. Experiments will also be instituted in the coming season to ascertain the distinctness of Tomato, and Shallot.

The Floral Committee has been mainly occupied in examining Begonias, of which the Society possesses one of the most complete collections existing; and of Begoniums, of which many striking varieties were presented by Lemoine, of Nancy, Pompon Dablas, Nasterius, Pentstemon, Gloxinias, Ceanothus, Neriums, and other miscellaneous plants, have been examined.

The crops of fruit, though below an average, nevertheless furnished good opportunities for pomological investigation, to acquire a knowledge of the subject, there being a collection of 265 varieties of Apples alone, arranged for examination in the fruit-room. The Vines in the great conservatory continue to supply abundant crops.

The Tea Roses, which, in accordance with the intention announced in last year's report, have been planted in the orchard-house, are making satisfactory progress.

The rockery, which was formed a few years ago, has been a great attraction to the Fellows and visitors. It is planted with the choicest rock and alpine plants, which are now well established, and has during the year been considerably enlarged.

To aid in fostering a taste for hardy border flowers the Council have largely increased the number of those formerly in the garden.

As applications of 912 Fellows were granted as follows:

18,886 plants.
19,644 packets of seeds.
4,000 Gladiolus bulbs.
5,272 Strawberry runners and cuttings of fruit trees.
45,002 total distribution.

In addition to the usual choice varieties of vegetable and flower seeds, seed of a selected strain of Begonia was distributed during the present year.

The sales of garden produce during the year appear in the accounts. A large quantity of Grapes still remain, which are being disposed of.

A requisition having been made by the Chiswick, The Royal Horticultural and the Royal Botanic Society, of which the Duke of Devonshire is President, for the use of the garden in which to hold an exhibition, the Council gave their consent, and a show was held, which was so numerously attended and successful that the Council hope that at some future time they may be encouraged to make a similar use of the garden.

The Council have pleasure in acknowledging the liberal donations made to the Chiswick garden, among which are:—

- The Royal Gardens, Kew, sixty-eight herbaceous plants.
- The Royal Botanic Society, a specimen *Araucaria excelsa*.
- Botanic Garden, Cambridge, seventy-seven herbaceous plants.
- Mr. T. S. Ware, 141 herbaceous plants.
- Mr. F. Wilson, Esq., thirty-seven herbaceous plants.
- Messrs. Lane & Son, a collection of Roses.
- Mr. Turner, a collection of Roses.
- Messrs. Paul & Son, a collection of Roses.
- Messrs. J. Laing & Co., a collection of Roses.
- Mr. J. Fraser, a collection of Roses.
- Mr. Turner, 111 varieties of Chrysanthemums.
- Mr. H. Brist, a collection of Palms.
- Baron Ferdinand von Mueller, of Melbourne, collection of seeds.

The Society is indebted to many Fellows and others for liberal donations of plants.

Lord Aberdeen, in moving the adoption of the report, desired that all who supply an omission in it, in reference to the death of Dr. Denny, whose loss his colleagues greatly felt, the deceased gentleman being a most ardent horticulturist, and an indefatigable worker in the interests of the Society. With reference to the work of the Society, its position and prospects, he, the Chairman, had little to say that was not contained in the report. He had

to congratulate them on the satisfactory increase in the number of Fellows during the past year, and also on the increase in the receipts, from £6820 in 1880 to £7031 in 1881. The expenses, however, were still somewhat large, but he hoped that with increasing prosperity the number of Fellows, and consequently the subscription lists would ere long show larger returns. Their receipts last year had been greatly reduced by the unfavourable weather which prevailed while their large summer show was being held, but he was glad to say that all their liabilities as contained in the revenue account, had been paid since January 1. The principal increase in the expenditure had been incurred by the appointment of the Rev. G. Henslow as lecturer, whose services he believed had been much appreciated by the Fellows. The decision of Mr. Justice Fry alluded to in the report had been appealed against, and the case was to have come on that day. It was probably at that moment before the court. If the Society gained it they would have another five years' tenure, irrespective of any further arrangement they might make. The exhibition held in the gardens by the Medical and Sanitary and Smoke Abatement Committee, had done good service, but he was afraid they must expect to receive so much from the latter as they had from the former. Mr. Guedalla seconded the motion, which was carried unanimously.

The scrutineers then announced the result of the ballot—the unanimous election of Mr. E. Giles Loder, Mr. J. H. Mangles, and Mr. William Lee, as members of Council; and of the following gentlemen as office-bearers for the ensuing year:—President: Right Hon. Lord Aberdeen; Treasurer: Mr. William Haughton; Secretary: Major F. Mason; Expenses Committee: Lord Alfred S. Churchill, Major F. Mason, and Mr. William Haughton; Auditors: Mr. K. A. Aspinall, Mr. John Lee, and Mr. James F. West. A hearty vote of thanks was accorded to the Chairman, and the meeting closed.

SCIENTIFIC COMMITTEE.—Sir J. D. Hooker in the chair.

Malformed Acorns of Quercus Ilex.—Specimens were sent from the Isle of Wight by Mr. F. Moore, which were referred to Dr. Masters for examination and report.

Disease of Carnations.—Mr. W. G. Smith exhibited specimens, furnished by Dr. Hogg, of what is termed "gout" in Carnations. The disease is caused by minute nematoid worms attacking the collar of the plant, and eating upwards through the parenchyma to the very tips of the foliage. The female worms are very prolific, and the plants mentioned were swarming with the worms and their eggs. The disease was illustrated in the *Gardener's Chronicle*, December 3, 1881.

Deformed Root.—The specimen from Mr. Ingram, figured at p. 147, was exhibited.

Lobed Leaves of the Pear.—Mr. R. D. Blackmore exhibited a three-lobed leaf, which had been produced on one of his trees after root-pruning, which led to some discussion.

Coloured Stages.—Mr. English, of Epping, exhibited specimens of flowers and fungi prepared by the process mentioned in his work on the subject, which originated a remark from Professor Church as to the use of plaster of Paris mixed with dry sand, for the purpose of speedily drying and retention of colour in flowers.

Apparent Superfertility in the Pea.—Mr. T. Laxton, of Bedford, forwarded a communication describing some experiments in fertilisation of the garden Pea. Taking Laxton's *compe* as the standard, he impregnated a pea flower with the pollen of the other varieties. The pod thus treated bore eight Peas, which, on germination, were distinguished as *a*, *b*, *c*, &c.; and *b* had purple flowers, the rest white; *a* and *g* followed very nearly the type of the seed-bearer, Prolific Long-pod; *b* approached No. 4 variety; *c* more nearly resembled No. 3; *c*, *f*, and *d* differed in various particulars from *a* and *g*, but these had pretty nearly the same characteristics of the pollen-bearer, Early Maple, or No. 4. Mr. Laxton drew the following conclusions as to the influence of the pollen of the different male parents:—*a*, from some of the Peas being wrinkled, were influenced probably by the pollen of Nos. 2 or 4, as both had taken effect; *b*, the colours of the seeds of some of which are wrinkled, indicating probably the influence of 2 or 4, or both; *c*, from the same appearances and from the position of the flowers, probably Nos. 2, 3, and 4; *d*, from the colour of the flower and the height, probably Nos. 1 and 2; *e*, from the colour and shape of the seeds, some being wrinkled, and the shape of the pods, probably No. 2, and perhaps 4 or 5; *f*, from the colour and wrinkling of some of the seeds, probably Nos. 1 and 2, or 4; *g* (similar to *a*), Nos. 2 or 4, or both; *h* (similar to *f*), Nos. 1 and 2, or 4. From these facts he deduces:—1. That the pollen of more than one variety of Pea used to cross-fertilise the same flower may influence more than one ovule in the same ovary. 2. That there is some evidence of the pollen from more than one variety affecting the same ovule.

Report on Winter Losses, &c., in Plants.—The Secretary, the Rev. G. H. Rowley, in a number of the press he had made in compiling statistics for a "Report on the Meteorological Phenomena of, and consequent Injury to Plants in Severe Winters." He had obtained particulars of several winters from A.D. 220 to 1881, but those during which destruction of, and injuries to, plants had been especially recorded, were the following seven:—1851-2, 1852-3, 1859-60, 1860-61, 1878-79, 1879-80, 1880-81. He had collected all the information he had at present been able to find with reference to these winters, and had drawn up first a short account of the principal meteorological phenomena of the year preceding each winter, as well as of the winter itself, as the behaviour of a plant under frost so much depends upon its previous conditions; in each case such was followed by details of injuries to, and losses of, plants over as many places in the British Isles as possible. The importance of registering meteorological phenomena and the losses in several winters lay in the fact that the conditions of the winters respectively differed in many ways from one another. The consequence was, that the immediate cause of a plant's succumbing to frost was not always the same. There would be an introduction dealing with several interesting matters bearing on meteorology and plant injuries, and it is proposed to complete it with copious indices, so that no difficulty would be met in finding the exact behaviour of any particular plant in any county and in any winter.—A discussion followed, in which the great importance of elaborating the report as fully as possible, and of speedily publishing it, were insisted on.

Specimens Exhibited.—Mr. Houston showed specimens of dissections of flowers mounted in preservative fluid, and intended for use in classes in the winter, when fresh specimens are not available. Mr. G. F. Wilson showed a pretty little creeping Oxalis, well adapted for borders in conservatories or other places, where its objectionable facility for getting beyond bounds, and on the kert, and the one Mr. Joseph Hooker identified it with O. microphylla. Mr. Harpur-Crewe showed the new and pretty Muscari linguatum, a native of Celcia, one good point in which is its habit of flowering early.

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair.—Fine groups of Cyclamens, Primulas, and Cinerarias, and a few other interesting objects made the Council-room quite gay for the annual meeting. Of the first-named flower Mr. Clarke, of Twickenham, sent a very fine group, the plants having good foliage and large flowers, pure and clean in colour, and well varied. A very fine white, named giganteum compactum, was much admired. A fine bank of Primulas and Cinerarias came from Mr. Henry Little, of Hillingdon Court, Uxbridge, included amongst the former being several well marked varieties, and one named Magneta Gem, a fine rich honours in colour, which was singled out for the highest honours. From Sir Trevor Lawrence, Bart., of Hillingdon, (Mr. Spyers) came one of the finest specimens ever seen of *Odontoglossum pulchellum majus*, a plant with nearly forty spikes of flowers, many of which bore nine blooms on a spike. This was awarded a Cultural Commendation and recommended for the further distinction of a Medal. *Odontoglossum Ruckerianum*, from the same collection, was also shown in fine condition. The weeping form of *Wellingtonia gigantea* sent out some years ago by Messrs. Little & Ballantyne, was well represented by a specimen about 6 feet high from the nurseries of Messrs. W. & J. Brown, Stamford. Mr. C. Edmunds, of Hillingdon, had in *Cyclamen persicum giganteum roseum compactum* [?] a good but much over-named plant, with light marbled leaves and large rose flowers. From Heatherback the Chairman brought a very handsome spike of fourteen flowers of a fine unspotted variety of *Odontoglossum crispum*—a perfect wreath in itself; also a nicely sized variety of the same species. Messrs. James Veitch & Sons showed a small group of fine white Cyclamen and other plants, including the excellent *Crocodyne cristata Lemniana*, which has a pale lemon-yellow crest on the lip; and a hybrid *Rhododendron* named Queen Victoria, with flowers in colour a pretty shade between buff and nankin. From Mr. Gilbert, of Burchley, came a very striking white hardy Primrose, named Gilbert's Harbinger, with flowers 1½ inch in diameter, profusely produced, and much in the way of variety names, and certified several years ago. A pretty lot of hardy Primroses of different colour also came from Mr. Anthony Waterer. A very fine mass of the extremely showy *Cineraria cruenta*, and flowers of the pretty "blue Marguerite," *Agathe celestis*, came from Messrs. Cannell & Sons. Mr. James brought up some cut blooms of his fine strain of *Cinerarias*. Mr. Turner had some nice Tree Carnations, and from Chiswick came an excellent group of plants of the old double white and other double Primulas, *Cinerarias*, &c.

The following are the awards:—

First-class Certificates.

To Messrs. W. & J. Brown, Stamford, for *Sequoia* (*Wellingtonia*) *gigantea pendula*.

To Mr. C. Edmunds, Hillingdon, for *Cyclamen persicum giganteum roseum compactum*.

To Messrs. James Veitch & Sons, for *Crocodyne cristata Lemniana*.

To Messrs. Veitch & Sons for *Rhododendron* Queen Victoria.

Mr. Gilbert, Burchley, for *Primrose* Gilbert's Harbinger.

To Mr. K. Clarke, Twickenham, for *Cyclamen persicum giganteum compactum*.

To Mr. H. Little, Hillingdon, for *Primula sinensis* Magneta Gem.

To the Rev. H. Harpur-Crewe, for *Muscari linguatum*.

Cultural Commendations.

To Sir Trevor Lawrence (Mr. Spyers, gr.), for *Odontoglossum pulchellum majus*.

To Messrs. H. Cannell & Sons, for *Cineraria cruenta*.

FRUIT COMMITTEE.—H. J. Veitch, Esq., in the chair. Mr. J. Atkins, gr. to Col. Lloyd Lindsay, M.P., Locking Park, Wantage, showed at this meeting nine of the most perfect bunches of Black Alicante Grapes ever seen in the month of February, each bunch being a model of compactness and good finish, and in all respects as fresh as in the month of October—a triumph of skill all the more remarkable as the present has been one of the worst seasons for keeping Grapes that has been experienced for several years. The committee recommended the award of a Bronze Medal, but on what principle we failed to see, as on two former occasions Mr. Atkins received Silver Medals for examples unequal in merit to these Alicante. Lady Dorothy Nevill contributed a number of Tangierine Oranges, fine, fresh, and pleasant in flavour. Messrs. Geo. Bunyard & Co., Maidstone, sent specimens of Smart's Prince Arthur Apple, a conical and somewhat angular fruit, streaked with crimson on the sun side, and supposed to be locally favoured in East Kent. Mr. J. F. Barber, of the Harrow Road, again showed some good Mushrooms grown in beds in the open air; and Mr. Green, gr. to Sir Geo. Mackay, contributed some ripe Bananas.

Edinburgh Botanical: Feb. 9.—The Society met this evening in 5, St. Andrew Square, Professor Bailour in the chair.

The following communications were read:—
I. "Notice of the late Sir Robert Christison, Bart." by the Chairman.

II. "Obituary Notice of the late Professor George S. H. Apple, M.D." by John Sibbald, M.D., F.R.S.E.
III. "Definition of a New Tree from East Australia (Dysoxylon Schifferi)." by Baron Ferd. von Mueller, Ph.D., M.D., F.R.S., K.C.M.G.

IV. "On Tilling." by A. Stephen Wilson, Esq., North Kinnmundy, Aberdeenshire. Illustrated by photographs.

By the word "tilling," as applied to a cereal grass, is meant the producing of more stalks than one from a single seed. The plumule of the embryo grows into the first or primary stalk, and all the secondary stalks arise either directly from the primary stalk or from secondary stalks which first arise from the root. All the secondary stalks are buds growing out of stalks, and not out of roots. Indeed it cannot be properly said that the primary stalk itself grows from the roots; its stalk and the roots grow simultaneously, and have a biological interdependence. When the roots produce the stalk than a man's legs produce his head.

All the tillers or secondary stalks are thus of the nature of branches, the buds or beginnings of which arise from the two or three lowermost nodes of the primary or internodes. No such buds are thrown out upon the internodes. The secondary stalks or tillers, which are really branches, throw out roots from their bases and lower nodes, but no stalk whatever arises directly from any root. In some plants a stalk may arise directly from a root, or a root may arise directly from a stalk, but in the great majority of cases the roots grow off a root.

But this note is not intended to be an exposition of the principle of tilling, but merely an introduction to the accompanying photographs of Barley and Oat plants.

These plants were grown in the garden at North Kinnmundy, where I have sown a great number of ears in order to test the limits of tilling. Previous experiments had shown that the main conditions necessary to ensure tilling is shallow planting. When a seed is put down 2 or 3 inches the plumule is drawn out and exhausted ere reaching the surface where the tillering takes place. When the seed is merely covered when it goes into tilling at once. The first set of seeds were sown up by the sparrows, so that a part of the tillering season was lost. The second set were protected until sown. The best Barley plant produced about 140 stalks, 120 of which showed the ear out of the sheath. The second had 121 ears; others had fewer, diminishing down to about fifty. The Oat plant submitted stood through the winter and produced about 10,000 returns.

Now, as the tillering process in the Barleys was going on during the whole season, some of the ears were not sown when the plants had to be pulled. But notwithstanding this, there can be no doubt that, in order to reap the full advantage of seed corn, it should be sown or deposited as near the surface as possible. This would be true of autumn sowing as well as spring sowing were it not for the effect of frost; but a severe winter renders deeper seeding advisable for other reasons than those directly connected with the development of the seed.

V. "On the Phenology of the Upper Ward of Lan-

arkshire in 1799." By Henry Buchan, S.S.C., in a letter to the Assistant-Secretary. Quoted from an old manuscript diary, Mr. Buchan showed that at Brownlee, near Carlisle, on January 24, 1799, "Wind was west on a very mild warm day. The whole of this winter remarkably mild and fresh. Polyanthus, Primrose, and Auricula in blossom. A Carnation has commenced putting forth flowers all winter. Some Beans in blossom." On February 21 of the same year the bees were carrying on work, and on March 28 the Jargonelles began to blossom, while on April 4 a Cherry tree on the wall began to blossom; and on May 2 Cherries, Plums, and Pears were in blossom. But this mild winter and favourable spring of ninety-two years ago were not followed by an early harvest. September was very rainy; the depth of rain on the 19th of that month—3 inches at 8 o'clock at night—being the greatest the observer had ever noted. On October 6 the harvest was general; and on the 24th the corn was mostly cut down, but on November 7 some "victual" was still out. This, however, is a district in which early harvests are hardly looked for in any season.

VI. "On Temperatures at the Royal Botanic Garden, and Effects thereof on Vegetation." by John Sadler, Curator.

Since the year commenced the weather has continued very open and mild. During the month of January the thermometer at the Royal Botanic Garden only fell below the freezing point on six occasions, as compared with twenty-seven occasions in January, 1881. The two hardest mornings were on the 4th, when there were registered 28°, or 4° of frost; and on the 25th, when there were 29°, or 6° of frost. There were registered collectively for the month 227° of frost, while 359° were registered the same month last year. Since February commenced the thermometer has been below the freezing point on three occasions, viz. on the 2d, 29°, or 3° of frost; on the 3d, 30°, or 2° of frost, and on the 7th, 28°, or 4° of frost. Owing to the mildness of the season and the occasional blinks of sunshine, many of the spring flowering plants are now in bloom. The growth of the young shoots of Roses, and flower and leaf-buds of many shrubs are further forward at this date than they have been for many years past. The following are some of the more conspicuous plants present in flower on the rock garden.—*Galanthus plicatus*, G. Elwellii, *Crocus biflorus*, C. erucicus, C. imperati, *Lecocyan vernum*, *Dulciodendron vernum*, *Orubus elegans*, *Primula denticulata*, *Sisyrinchium grandiflorum* (purple and white varieties), *Hebeborus colchicus*, and other species, and white and blue Hepaticas, &c. The Botanic Garden purple variety of the common Primrose is now in full flower in the roseary and rock garden. Yews, certain species of Alnus, Hazel, &c., are flowering freely. Grass has recently commenced growing, so that the scythe will ere long be in requisition.

Natural History.

HABITS OF BIRDS AND ANIMALS FREQUENTING THE GARDEN.—In a former communication on this subject, at p. 25, I am made to say that the common kite is in some parts of the country regarded as a bird of ill-omen, &c. I intended to have said the common yule or yorling, which in some parts of the country are names applied to the yellow ammer or yellow bunting (*Emberiza citrinella*). But why he should be regarded as a bird of ill-omen, or why the following doggerel couplet should be made to apply to him, I am quite unable to say; as he is certainly a very pretty bird, and although not much of a songster, he is nevertheless perfectly harmless. The couplet is as follows:—

"Part Paddy, part Taid, part Yellow Yorling,
I drink a drop o' the Deil's blind every Monday morning."

I ought also to have mentioned another nocturnal bird, allied to the owl, which in some parts of the country frequents light gardeners, or gardens where the cockchafer abounds—I mean the nightjar (*Caprimulgus europaeus*), which is not only a perfectly harmless bird, but does good service in gardens, where this horribly destructive insect abounds, as they feed greedily upon them. And any one who has witnessed the ravages which these terrible insects commit upon crops of various kinds, as well as upon trees and plants of nearly all species, will hardly fail to encourage by all possible means the nightjar, which, like the owl, passes noiselessly through the

summer evening's air in quest of its favourite food, which it seizes while on the wing, as well as when settled upon the leaves of fruit trees, &c., while the sharp snaps of his small, though powerful bill, may be distinctly heard in rapid succession. This bird, like many others, is migratory, and generally arrives upon the south-east coast about the middle of May, and departs towards the end of September. They form no nest worth calling such, and the female deposits her eggs upon the dry soil, not infrequently in Asparagus plantations, or other sheltered and quiet situations, and like the partridge when disturbed while sitting upon her eggs or young, instinctively flutters upon the ground as if disabled, in order to draw attention from them. The bird also utters a peculiar quivering or jarring note, which when heard in the stillness of evening-tide is considered to indicate or foretell fine and settled weather. Although the bill or beak of this bird is small in proportion to its size, and is surrounded by long stiff bristles which point forward—a provision which no doubt assists it in capturing large insects, such as the cockchafer, and other large moths in flight—its gape is something enormous; so that in some parts of the Eastern Counties it is not unusual to hear it said of its one possessed of a wide mouth that he or she is like a nightjar—when his mouth is open his head is half off. Its legs are short, but its wings and tail are very long, which enables it to perform the most sudden evolutions, and to mount from a level flight instantaneously like a sky-rocket. This pretty and inoffensive bird is often wantonly shot, which is much to be regretted, as it is seldom or never numerous, and being entirely insectivorous, is of great service in the garden and elsewhere.

THE RAT.—Of all the rodents which are apt to infest gardens, the most mischievous, as well as the most destructive, is the ubiquitous rat—next to him, his troublesome little relative the mouse; and to diminish or check the increase of such vermin many well-known expedients are had recourse to, with varying success. The mole, too, when he finds his way into the garden, often proves exceedingly troublesome, not on account of what he eats, which no one would begrudge him, consisting as it does of earthworms and various noxious larvae, but on account of his excavations and consequent injury to crops of all kinds, and his disfigurement of lawns, &c., which renders his presence in the garden anything but desirable.

THE COMMON SQUIRREL, (*Sciurus vulgaris*) is the most sprightly, active, and elegant member of the order Rodentia, and if he would restrict his diet to acorns and Beech mast, and forbear biting the tops off rare Conifers, &c., he would, no doubt, be universally respected and protected, as he is, in spite of his many shortcomings, universally admired. But unfortunately if he once discovers where the Filberts and other nuts are growing, nothing short of the gun will prevent him from transferring the whole or the greater portion of the crop to augment his store of provision for the coming winter—an example, it is true, of foresight and industry, but one which the owner of the nuts may fail to altogether approve of.

THE SHREW is one of the smallest of British quadrupeds, and is not infrequently found in gardens, but being, as far as I know, strictly insectivorous, does no harm, but probably some good.

THE WEASEL preys upon the shrew, as well as upon the more formidable rat, and the mouse; indeed, this wonderfully agile little creature is possessed of such courage and ferocity that he does not hesitate to attack even the rabbit and the hare. So that while he keeps in the garden he is useful rather than otherwise, but when he gets into the covert the gamekeeper generally takes account of him, and weasels are consequently becoming very scarce.

THE HEDGEHOG seldom finds his way into the garden, and when he does so he does no harm whatever, but much good. This very inoffensive little animal is well known on account of his singular but most efficacious means of defence. His pace is very slow, and he cannot flee from the face of danger, nor has Nature furnished him with any effective means of defence further than the sharp prickles of his coat, and his power of so contracting his body as to effectually hide his head and feet, and so form himself into a prickly ball which few animals care to interfere with. Few animals have, however, been

more maligned than this poor little persecuted creature, who is accused of robbing orchards, ascending Apple and Pear trees like a squirrel or a cat, biting off the fruit, and carrying away the same upon the points of his spines. This he is, of course, supposed to do under the cloud of night, but I wonder if any of your readers ever met with him so encumbered. I never did so, and I have sometimes been abroad at night too; but by far the most extraordinary of his depredations is asserted to be that of milking cows. It was seriously stated in a country contemporary some time since that a valuable cow belonging to an extensive dairy from some inexplicable cause withheld her milk [?Query, from aversion to the animal?], or a portion of it, until the cowman solved the mystery by discovering in her immediate vicinity the cause of all the mischief in the person of a full-grown hedgehog, upon which he at once inflicted condign punishment, for an offence of which he may have been about as guilty as the yellow yorling alluded to in the foregoing couplet is of taking his Monday morning draught.

It is strange, however, to think that such a belief should ever have been formed as to the existence of either the will or the power in this little animal to perform such an operation. It feeds, however, chiefly during the night, and may occasionally have been found in close proximity to reposing cows or other stock, and it is possible that it may seek such company for the sake of the warmth and shelter it affords. He is also, with possibly more feasibility, strongly suspected of sucking the eggs of the partridge and the pheasant, &c. This may or may not be the case; it is possible that in such matter he may sometimes finish what the rats have begun. At all events, there is a doubt in the case, the benefit of which, unfortunately for him, he never gets, as the gamekeeper invariably kills him wherever he finds him. His principal food is no doubt worms and insects of various kinds, even reptiles, as it has been ascertained that he will kill and eat even so formidable a reptile as the snake. He will also, to some extent, feed upon vegetables and fruit, and when in a state of domestication feeds on soaked bread or boiled Potatoes, &c. They are sometimes kept in kitchens and cellars, and are said to soon free them from cockroaches, blackbeetles, and other troublesome insects. They are also susceptible of kindness, and will allow themselves to be fondled by those who may have gained their confidence. When at liberty they form for themselves snug, warm nests of moss and dry leaves in some dry bank or similar situation, where in pairs they pass the winter coiled up in a state of semi-insensibility. *P. Grievé.*

THE WRYNECK (*Yunx*) has been heard in this neighbourhood for some days. On Sunday the 12th I first heard it myself, and remarking to a friend that it was very early for its arrival, he said that his attention had been called to it some days before by a person asking him to listen to "that strange bird," and he went on to say that there was a common opinion that after the advent of this bird little more severe weather was to be expected. Although one swallow does not make a summer, a wryneck before the middle of February is an early note that spring is coming. *M., Ilustrierpoint.*

CANADIAN NOTES.

We had a very peculiar fall. The Maples and Beeches remained green for a long time, and then all at once cast their leaves, and left us minus their usual autumn glories, and the only piece of agreeable scenery left us was in our woods of evergreen trees—the tall, jagged-topped Pines, and the towering pyramidal Spruces contrasting finely with the lighter green of the graceful Cedars and the pert little Balsams and the decided russet of the elegant Tamaracs. However, these effects are passed away, and after some fitful weeks of alternate snowing and thawing—requiring buggies to start out on a journey and cutters to return home—we now have winter nicely upon us, and delightful sleighing, and the roads are all alive with farmers drawing their grain and hay to market, and the woods are equally swarming with gangs of men either lumbering or getting out timber for paper manufacture or for all kinds of railway material for the Canada Pacific Railway, and all the various ramifications of lines intended to be connected with it. There have been considerable purchases of excellent

horses sent northwards for railway purposes, and the large sums of money spent in the work, although doubly paid for by the Dominion in both money and land, have put us all into good spirits, coupled with and principally on account of the favourable results of a generally good harvest and of high prices for all our produce. Wheat has realised from 1 dol. 18 c. to 1 dol. 32 c., and 1 dol. 18 c. again, for the bushel of 60 lb., and Hay 12 to 15 dol. per 2000 lb., and Oats and Peas proportionately high. Potatoes, which began at 40 c. for the bag of 90 lb., are now worth, in consequence of extraordinarily large exportations to the United States, 1 dol. *Mtiness, Ontario, Canada, January 20.*

Florists' Flowers.

CYCLAMENS.—An entire house devoted to the blooming of Cyclamens in a private garden is not a common feature; still less unusual do we see Cyclamens well done in such places. But at Syon Mr. Woodbridge has not only a house full of these plants, but they are also remarkably good; still more, they are useful to an extent that cannot easily be calculated. The Cyclamen is one of the most fertile producers of winter flowers we have; strong plants may be pulled from incessantly, and seem none the worse for the robbery. Then the blooms are so happily fitted for decorative uses; they have long stems that need no wiring, are stout and enduring, and generally give those light pleasing hues of colour that are so acceptable during the winter months. Any gardener who may contemplate the constant culture of the Cyclamen should first ensure the possession of a good even growing strain; one that produces very many flowers and good even heads of bloom is preferable to those leggy large-flowered strains that are not nearly so floriferous. The raising of a batch of seedlings need not be a work of difficulty, as for these a gentle heat will suffice to germinate the seed, and also to promote growth in the seedlings when they are pricked out into small pots. Any shelves, especially those used for the fruiting of Strawberries, and near the light, will suffice for the summer growth, as Cyclamens do not need heat when there is plenty outside. The great necessity in connection with the Cyclamen is a fitting house in which to bloom them, for they never thrive well if mixed up with other plants. They need plenty of light, to be near the glass, and to enjoy an even and fairly dry temperature, as damp brings spot in the flowers, and robs them of their highest charm—purity of colour. There ought to be no more difficulty in growing Cyclamens well in private gardens than is found in market growing establishments. A good deal is made at times of clever growers and secrets of culture, but there is much more in suitable houses and careful attention.

PLANT PORTRAITS.

GOMEZA PLANIFOLIA, Lindl., VAR. **CROCEA**, Regel, *Gartenflora*, t. 1053.—A Brazilian Orchid, chiefly of botanical interest.

GRAPE EARLY MONTREUIL, *Rev. Hort.*—A very early Grape, used for wine-making. Berries small, globose, black; flavour acidulous. Ripens at Paris in September.

LILIU RUBESCENS, Watson, *Garden*, Nov. 12.—The plant sometimes called L. Washingtonianum purpureum but here considered as a separate species by reason of its smaller erect darker coloured flowers.

LILIU WASHINGTONIANUM, *Garden*, Nov. 12. **MALIXILLARIA OCHROLEUCA**, *Belg. Hort.*, t. xviii., 1880.—Pseudobulbs elongate, oblong leaves, strap-shaped flowers in loose racemes, perianth segments narrow, lanceolate, pale yellow, lip three-lobed, orange.

NYMPHEA TUBEROSA, A. Paine, *Bot. Mag.*, t. 6536.—Chiefly distinguishable from *N. odorata* by the small tubers on the sides of the rootstock. *Kew.*

OPHIPOGON JABURAN VOL., *Rev. de l'Hort. Belg.*, December.—Leaves linear, strap-shaped,

green, prettily striped with white; flowers small, lilac, in long dense spikes.

PELAGONUMS. *Floral Mag.*, t. 467.—Show varieties:—1, Chivalrous; 2, Martial. Mr. Charles Turner.

PHILODENDRON BIPINNATIFIDUM, *Gartenflora*, t. 1029, f. 1 and 2.—A noble Aroid, of semi-scandent habit and large, long-stalked, cordate ovate, bipinnatifid leaves, from the axils of which proceed the brownish, boat-shaped spathes, which enclose the thick columnar yellow spadices.

PTICARIA ZEPHYLLA, Koch, *Bot. Mag.*, t. 6535.—A Bromeliad with tufted leaves, in shape like those of the Maize, and with erect spikes of long curved white flowers emerging from scarlet boat-shaped bracts. Central America.

SALVIA COLUMBARIÆ, Benth., *Bot. Mag.*, t. 6595.—Annual, 1—2 feet high, with bullate, pinnatolobed leaves, and close heads of amethystine bracts and flowers. Native of California and Arizona. Introduced by Mr. Thomson, of Ipswich.

SPARAXIS PULCHERRIMA, *Garden*, Dec. 17.—Leaves lanceolate. Flower-stems slender, wiry, peduncles recurved, flowers 6-parted, bell-shaped, lilac. The plate of this beautiful flower was drawn from specimens in the Caledonian Nursery, Ghersey.

STATHYPHYLLUM PATINI, N. E. B., *Illustr. Hort.*, t. 397.—A dwarf tufted Aroid, with elongated stalks supporting lanceolate leaves, and surrounding stalked spadices, with narrow white spathes. See *Gard. Chron.* 1876, p. 199; 1877, p. 139; 1878, p. 662, 783.

Obituary.

THE announcement of the death of Mr. WILLIAM HURST, formerly of 6, Leadenhall Street, and lately of 152, Houndsditch, which occurred on the 11th inst. at his residence, 16, Kensington Gore, at the age of fifty-two, will be received with general regret, especially among the representatives of the seed trade throughout the United Kingdom, among whom he was more generally known than in other branches of horticulture. At the head of what is unquestionably the largest wholesale seed establishment in the United Kingdom, with a high reputation both at home and abroad, his position was one of great importance and responsibility. Unfortunately, during the last two years he was afflicted with loss of sight, which necessitated his entire withdrawal from business at intervals, and this loss of sight seemed to be the precursor of a painful malady, to which he has in the prime of life succumbed. On leaving school at fourteen years of age, Mr. William Hurst was taken into the seed warehouse of Messrs. Hurst & McMullen, of 6, Leadenhall Street, his father being one of the founders, and the head of the business. Here he made himself thoroughly acquainted with the details of the trade, and travelled important business journeys, making himself acquainted with the leading customers in all parts of the country; and about twenty years ago, when Mr. McMullen retired from the firm, he was taken into partnership with his father, and the business was conducted under the designation of Hurst & Son. From this time onwards the business increased very largely both at home and in the colonies; at the present time the firm has extensive transactions with New Zealand and Australia. The late Mr. William Hurst was one of those men of whom it may be said his heart was thoroughly in his business; he gave his whole time to it, and under his generalship the firm consolidated and extended the high reputation it now enjoys.

As one of the trustees of the Gardeners' Royal Benevolent Institution Mr. Hurst was well known; he was a liberal supporter of the charity, and took a great interest in its progress and work. Mr. Hurst was the last surviving son of the Mr. William Hurst who founded the business; and the only remaining member of the family is his sister, the wife of Mr. Sherwood, a partner in the firm, who under the terms of the will of the deceased becomes the sole residuary legatee. The business of the firm will still be continued under the old and familiar designation by Mr. Sherwood, assisted by Mr. J. S. Johnson. It is not too much to state that the feeling of regret to which allusion has been made will be felt throughout the country, as well as Ireland and Scotland, where a visit from Mr. Hurst was looked upon in many cases as a leading event of the year. The business was carried on for forty years in Leadenhall Street, and two or three years ago was transferred to Hounds-

ditch, one of the City improvements requiring the premises hitherto held by the firm.

—Mr. CAREY TYSO, of Wallingford, whose name has been so long associated with the improvement and culture of the Anemone and Ranunculus, died at Wallingford on the 21st inst. at the age of sixty-seven. He was one of the oldest inhabitants of the town, and identified himself closely with many matters of public interest. He went to Wallingford with his father, the Rev. Joseph Tyso, as long ago as the year 1821. The Rev. Joseph Tyso was an enthusiastic cultivator of the flowers above-named, and this regard was shared by his son, the result being that the Rev. Joseph Tyso started in business at Wallingford fifty years ago. It gradually grew from a florist's into a general nursery business, and three years ago it was sold by Mr. Carey Tyso, when he retired, to Messrs. Pounsett & Son, who now carry it on. 1 or many years it was Mr. Tyso's practice to issue a catalogue of Anemones and Ranunculus, and he was the author of treatises on the cultivation of these flowers.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 15, 1882

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR (Highest, Lowest, Range, Mean bar, Daily, from average of 50 years), Hygrometric Deductions (Wet Point, Degree of Sat. in 100, Average Direction), WIND, RAINFALL.

Feb. 9.—A fine day, but overcast and dull. A fine night, with dark sky. 10.—A fine morning, sky overcast; a fine bright afternoon. Fine clear night. 11.—A fine bright day, sun shining brightly. A fine, nearly calm night. 12.—A very spring-like day. Fine clear night. 13.—A fine day, but windy. Windy night. Highest temperature of the day took place at midnight. 14.—A fine bright day. Rain at night; dark sky. 15.—A dull, miserable day; overcast and rainy. A fine clear, cold night.

LONDON: Atmospheric Pressure.—During the week ending February 11, the reading of the barometer at the level of the sea decreased from 30.49 inches at the beginning of the week to 30.37 inches by 3 P.M. on the 5th, increased to 30.53 inches by 9 A.M. on the 6th, decreased to 30.51 inches by 3 P.M. on the 6th, increased to 30.58 inches by midnight of the same day, decreased to 30.42 inches by 3 P.M. on the 8th, increased to 30.55 inches by 9 A.M. on the 9th, and was 29.83 inches by the end of the week.

The mean reading for the week at the level of the sea was 30.35 inches, being 0.11 inch lower than last week, and 0.40 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 50°.5, on the 11th. On the 9th the temperature did not rise above 36°.5. The mean of the seven high day temperatures was 42°.3.

The lowest temperature in the week was 28°.2, on the 5th; on the 7th the lowest temperature was 38°. The mean of the seven lowest temperatures was 33°.3.

The greatest range of temperature in one day was 16°.5, on the 11th; the smallest was 5°, on the 9th. The mean of the seven daily ranges was 9°.

The mean daily temperatures were on February 5, 34°; on the 6th, 37°.2; on the 7th, 40°.7; on the 8th, 37°.5; on the 9th, 34°.4; on the 10th, 38°.3; on the 11th, 41°.0. Of these the 7th and 11th were above their averages by 1°.6 and 2°.0 respectively; all the rest were below their averages by 5°, 4°.6, 1°.6, 4°.7, 0°.7 respectively.

The mean temperature of the air for the week was 37°.8, being 1°.2 higher than last week, and 1°.3 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 160°, on the 11th; the highest, on the 9th, was 39°. The mean of the seven readings was 61°.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 22°, on the 5th. The mean of the seven readings was 28°.4.

Rain.—No rain fell. Fog prevailed on the 6th and 7th.

ENGLAND: Temperature.—During the week ending February 11, the highest temperatures were 54° at Sunderland, 53°.2 at Cambridge, and 53° at Truro. The highest temperature at Wolverhampton was 44°.6, at Brighton 45°.2, and at Nottingham 46°.7. The general mean was 49°.4.

The lowest temperatures in the week were 26° at Truro, 28°.2 at Blackheath, and 28°.7 at Cambridge. The lowest temperature at Leeds was 37°, at Bradford 39°.6, and at Liverpool 36°.2. The general mean was 31°.7.

The greatest ranges of temperature in the week were 27° at Truro, 24°.5 at Cambridge, and 22°.3 at Blackheath. The least ranges were 11° at Leeds, 11°.3 at Liverpool, and 12°.2 at Wolverhampton. The general mean was 17°.7.

The mean of the seven high day temperatures was highest at Sunderland, 49°.7, at Truro 49°.4, and at Plymouth 47°.4; and was lowest at Brighton, 42°. at Blackheath 42°.3, and at Wolverhampton 42°.8. The general mean was 45°.2.

The mean of the seven low night temperatures was highest at Bradford, 30°, at Liverpool 38°.7, and at Truro 38°.6; and was lowest at Cambridge, 32°.8, at Blackheath 33°.3, and at Brighton 35°.4. The general mean was 35°.8.

The mean daily range was greatest at Sunderland, 11°.6, at Cambridge 11°.5, and at Leicester 11°.4; and was smallest at Bradford, 6°.7; at Liverpool, 6°.8; and at Leeds, 7°.9. The general mean was 9°.4.

The mean temperature for the week was highest at Truro, 43°.6, at Sunderland 43°.5, and at Bradford 42°; and was lowest at Brighton, 37°.3, at Blackheath 37°.8, and at Cambridge 38°.2. The general mean was 40°.2.

Rain.—The largest falls were 0.41 inch at Truro, 0.25 inch at Wolverhampton, and 0.24 inch at Liverpool. The least falls were 0.01 inch at Sunderland, and 0.02 inch at Bristol, Bradford, and Leeds; no rain fell at Brighton, Blackheath, Cambridge, or Hull. The general mean fall was 0.08 inch.

SCOTLAND: Temperature.—During the week ending February 11 the highest temperature was 54°.8, at Edinburgh; at Dundee the highest temperature was 49°. The general mean was 51°.1.

The lowest temperature in the week was 31°, at Dundee; at Greenock the lowest temperature was 36°. The general mean was 33°.7.

The mean temperature for the week was highest at Paisley, 44°.3; and lowest at Dundee, 40°.9. The general mean was 33°.7.

Rain.—The largest falls were 1.47 inch, at Greenock, and 1.69 inch at Paisley; the least falls were 0.08 inch at Aberdeen, and 0.11 inch at Leith. The general mean was 0.53 inch.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

CYPRIPEDIUM: B. Fines. We do not recognise the Cypridium, but it is somewhat in the way of C. thalianum. It has small yellow flowers, which will hardly command themselves to dried herbar.

ECHEVERIA JACQUINIELLOEA: J. B. P. If the old plants have done flowering cut them down, and as soon as they break fresh put in open peat and loam, and grow on in a stove. The young wood strikes freely in sandy soil in a good brick bottom-heat. If the flowers are wanted for cutting, a good plan is to strike them later on, and flower them in the cuttings-pots.

INDOOR CLIMBERS: F. Freeman. We recommend the following:—For stove—Allamanda Hendersoni, or A. Schottii, Clerodendron Balfourianum, Passiflora racemosa and P. Buonanotte, Vignona venusta and B. Chamberlayni, Thunbergia Harrisii, Hæxentricus myrsocentris, Combretum purpureum, Stephanotis floribunda, Sigmaphyllon cilium, Desmanthus grandiflorus. To these might be added some of the beautiful Escyanthuses, which will clothe the damp walls, rooting like Ivy. For intermediate Stove—Bougainvillea glabra and B. speciosa, Mimulus saxifolius, Vignona Carrii and B. speciosa, Passiflora luteo-rosea and P. Impatiens Eugenia, Solanum venustum, Hoya carnea, Aristolochia Duchartrei, Dipladenia boliviensis, Bouamara Garden. There are some other fine Escanthes which might be added. For green-house—Lapageria rosea and L. rosea alba, Vignona jasminoides, splendida, Passiflora cinnamata and P.

SEVENTY-FOUR ACRES OF FRUIT TREES.—Apples, Pears, Plums, Cherries, Peaches, Nectarines, Apricots, and other Fruit Trees, as Standards, Dwarf, Pyramids, Bushes, Cordons and Trained Trees in great variety, all full of vigour and warranted true to name. Descriptive Price LIST, containing a sketch of the various forms of Trees, with Directions for Cultivation, Soil, Drainage, Manure, Pruning, Lifting, Cropping, Treatment under Glass; also their synonyms, Quality, Size, Form, Skin, Colour, Flesh, Flavour, Use, Growth, Duration, Season, Price, &c., for 1d. stamp.

TWELVE ACRES OF ROSES.—Standard, Dwarf, and Climbing, all the popular sorts; also 80,000 choice Tea-scented and Non-sette Roses in pots; extra strong Roses in pots for immediate forcing. See Descriptive Price LIST for 1d. stamp.

TWO HUNDRED THOUSAND HERBACEOUS and ALPINE PLANTS for Borders, Rock-work, &c. See Descriptive LIST, giving colour, height, time of flowering, &c., and free by post for 1d. stamp. R. S. & Co.'s selection of 100 good showy varieties for 25s.

GRAPE VINES and ORCHARD-HOUSE TREES in POTS.—GRAPE VINES, extra strong, short-jointed and well-ripened Planting Canes, 2s. 6d. to 3s. each; extra strong Forcing Canes, 7s. 6d. to 10s. 6d. ORCHARD-HOUSE TREES, Fruiting in Pots, consisting of Peaches, Nectarines, Apricots, Plums, Cherries, Pears, Apples, and Figs. Descriptive Price LIST for 1d. stamp.

LIST of all the EVERGREEN FIR TRIBE, suitable for Britain, giving size, price, popular and botanical names, derivations, description, form, colour, foliage, growth, timber, use in arts, native country, and site there, situation, soil, and other information, with copious index of their synonyms. Free by post for six stamps.

LIST of STOVE and GREENHOUSE PLANTS, comprising the best selections of Camellias, Azaleas, Ericas, Epacris, Ferns, &c., free for 1d. stamp.

LIST of EVERGREEN and DECIDUOUS SHRUBS, RHODOENDRONS, STANDARD ORNAMENTAL TREES, CLIMBING and TWINING PLANTS, with their generic, specific, and English names, native country, height, time of flowering, colour, &c., and general remarks, free for a penny stamp.

ALL KINDS of GARDEN SEEDS, of first quality. BULBS, MUSHROOM SPAWN, TOBACCO PAPER, ARCHANGEL MATS, and other GARDEN REQUISITES. See LISTS, which may be had on application.

SEAKALE.—Extra Strong, for Forcing, 2s. 6d. per dozen, 16s. per 100.

Ferns a Speciality.

EXOTIC and BRITISH FERNS, in great number and variety, suitable for Stove and Greenhouse cultivation, for Outdoor Ferneries and other purposes.

Intending Purchasers before buying elsewhere should send for our SPECIAL LIST of CHEAP FERNS, which will be forwarded free on application. W. and J. BIRKENHEAD, Fern Nursery, Sale, near Manchester.

VEGETABLE and FLOWER SEEDS OF SUPERIOR QUALITY.

CARRIAGE PRE-PAID.

DICKSON and ROBINSON,

SEED MERCHANTS,

12, OLD MILLGATE, MANCHESTER

Offer the following extra choice Seed:—

- BROUCCI—D. & R.'s Superb Dwarf Early White, 1 0
CAULIFLOWER—Dickson's Eclipse, 1 6
CELERY—D. & R.'s Manchester Champion Red, 1 0
D. & R.'s Manchester Champion Dwarf White, 1 0
CUCUMBER—D. & R.'s Improved Telegraph, 1 6
Tender and True, 1 6
LITRICE—Early Paris Market, 1 0
MELON—Best of All, flesh whitish, 1 0
" Eastern Casle, Green-flesh, 1 0
ONION—Magnum Bonum, 1 0
" Little Giant Yellow, 1 0
PEA—Culverwell, Telegraph, per quart 2 0
" Marvel, per quart 2 6
" McLean's Best of All, per quart 2 0
TOMATO—Stamfordian, per quart 1 0
" Queen, per quart 1 0

Also COLLECTIONS of VEGETABLE SEEDS for One Year's Supply:— No. 1. No. 2. No. 3. No. 4. No. 5. No. 6. 12s. 6d. 12s. 11d. 14s. 11s. 6d. 17s. 2s. 17s. 3s. 14s. 4s. For contents of these Collections, see Seed Catalogue.

COLLECTIONS of CONTINENTAL and ENGLISH FLOWER SEEDS.— No. 1. No. 2. No. 3. No. 4. No. 5. 10s. 6d. 15s. 12s. 14s. 11s. 6d. 12s. 6d. For contents of these Collections, see Seed Catalogue.

Also SMALLER COLLECTIONS of CHOICE FLOWER SEEDS, 1s. 6d., 2s. 6d., 3s. 6d., 5s., and 7s. 6d., each. For descriptions of the above and other Select and Genuine Seeds, POTATOS for Planting, and GARDEN REQUISITES, see our Illustrated Vegetable and Flower Seed CATALOGUE, which may be had free on application.

DICKSON & ROBINSON, 12, OLD MILLGATE, MANCHESTER.

The Best New Early Market Potato—KERR'S "QUEEN OF THE SOUTH," a new Seedling by the same raiser as "Reading Ash," and "Fillbasket," a cross between "Early Goodrich" and "Myatt's Kidney"—quite a distinct early white variety, somewhat in shape like "Magnum Bonum." Hitherto it has been entirely free from disease, grows a good crop of show, is an immense cropper, and for cooking qualities it cannot be surpassed. As an early market variety for extensive cultivation it can be very strongly recommended. Price 14 lb., 4s. 6d.; 56 lb., 15s.; 112 lb., 25s. Send for our Potato LIST, which contains all the best kinds at moderate prices. KERR and FOTHERINGHAM, The Royal Seed Establishment, Dumfries.

SEED POTATOS ASHLEAF KIDNEY, 4s. 10s. per ton. MYATT'S KIDNEY, 4s. 10s. per ton. REPSIN FLOUZE BALL, 4s. 10s. per ton. CHAMPIONS, 4s. 10s. per ton. DALMAHOY, 4s. 10s. per ton. FORTYFOLDS, 4s. 10s. per ton. EARLY OXFORD, 4s. 10s. per ton. For Nett Cash, and free on rail at Edinburgh. FETER S. ROBERTSON AND CO., Trinity Nurseries, Edinburgh.

GORDON'S NEW VICTORIA POTATO.—This Potato was awarded the Special Prize of the Highland and Agricultural Society's Silver Medal, at the Northern Counties Show at Inverness in December, 1881, and also the First Prize in the Regent Class. It somewhat resembles the Emerson's Victory, being of good shape, moderate size, and a heavy cropper, and has hitherto almost entirely resisted disease or blight. It is of excellent cooking quality, boiling white and mealy, with little waste, is a good keeper, and may be freely cut into sets. Sample Cwt. Bag sent on receipt of Postal Order for 7s. 6d., payable to R. STUART, Dundale Farm, Gravesend. Price per Ton on application.

CEDRUS DEODARA, 4 feet, 18s. per dozen; 5 to 6 feet, 24s. per dozen; 7 feet, 36s. per dozen. PICEA NORDMANNIANA, 3, 4, and 5 feet, 24s., 30s., and 36s. per dozen. NOBILIS, 3 to 4 feet, 48s. per dozen. LASIOCARPA, 1 foot, 72s. per dozen. ABIES ORIENTALIS, 4 feet, 80s. per 100. CRYPTOMERIA JAPONICA, 2 to 3 feet, 18s. per dozen. THUYOPSIS DOLABRATA, 3 to 3 1/2 feet, 40s. per dozen. RETINOSPORA PLUMOSA, 2 1/2 feet, 20s. per dozen. CUPRESSUS MACROCARPA, 3 feet, 72s. per dozen. THUYA LOBBII, 3 feet, 10s. per 100. Finest specimens, and will remove with safety. GAILIES MITCHELL, Nurseryman, Stranraer.

SEED POTATOS.—A quantity of Schoolmaster for sale, guaranteed true, grown on red land from seed purchased of Messrs. Webb & Sons, Price 7s. per Bush of 80 lb. Half a ton and upwards considerably less by special arrangement. R. ROBBINS, The Hollies, Kenilworth.

Genuine Garden Seeds. W. FROMY AND SON'S new Descriptive CATALOGUE of Vegetable and Flower Seeds and Garden Requisites will be forwarded on application. Sutton Court Nursery and Seed Establishment, Turnham Green, London, W.

FOREST TREE SEEDLINGS.—One of the finest and largest Stocks to choose from, including both True Native and Imported Scotch Fir, and 2 1/2 of which we have without doubt the finest lot in Scotland. True Highland Scotch FIR, also Austrian, Laticis, and Montana PINES, Scotch FIR, ASH, BEECH, BIRCH, BROOM, Spanish CHESTNUTS, English and Wych ELM, HAZEL, HORNBEAM, HOLLY, LABURNUM, SYCAMORE, CURRANT, WHIN, &c. Also very large stocks of nearly all kinds of transplanted FOREST TREES, of all sizes, in splendid condition for removal. Special prices on application. FETER S. ROBERTSON AND CO., Trinity Nurseries, Edinburgh.

Buy your Potatos Now, while they are cheap. S. BIDE has to offer a fine Stock of S. MAGNUM BONUM and SNOWFLAKE, a special price for which will be given for large quantities; also READING ABBEY and MYATT'S ASHLEAF. Prices on application to S. BIDE, Alma Nursery, Farnham, Surrey.

Raspberry Canes. FOR SALE, a large quantity of the FAS-TOLF variety, and the leading varieties of STRAWBERRY PLANTS. Prices on application to JOSIAH H. LATH, Manor Farm, North Cray, Kent.

WANTED, One or Two good Customers, to buy 100 Tons of good sound MAGNUM BONUM and 30 Tons of SNOWFLAKE POTATOS. Send for price and state quantity required to S. BIDE, Alma Nursery, Farnham.

Pansies and Violas. DOWNIE and LAIRD, Royal Winter Garden, Edinburgh, are sending out the finest Show and Fancy PANSIES and VIOLAS that money can buy, at from 4s. to 20s. per dozen. The above have taken First Prizes wherever shown last season. Prices on application to FLORESTA'S FLOWERS LIST free on application.

FOR SALE, 30,000 good stout ASH, 2 1/2 to 3 feet, free on rail at 20s. per 1000. S. BIDE, Alma Nursery, Farnham.

PRICKLY COMFREY.—Now is the best time to make plantations of it. Strong crown sets from sandy land can be had at 25s. per 1000. Special quotations to the Trade. Apply to THOMAS S. WARE and SONS, Seed Growers, Leicester.

Choice Perennial Seeds. THOMAS S. WARE has pleasure in announcing that his CATALOGUE of the above, consisting of a selection of CHOICE HARDY PERENNIALS and FLORESTA'S FLOWER SEEDS is now ready, and may be had free on application. Hale Farm Nurseries, Tottenham, London.

To the Trade.
THOMAS IMRIE AND SONS can offer
 SEED POTATOS, in variety. Quotations and sorts to
 offer on application. LIST of Surplus Nursery Stock to offer
 on application also.
 Nursery and Seed Warehouse, Ayr.—February, 1882.

**NEW ONION,
 CRANSTON'S "EXCELSIOR."**

This grand new variety has in every way fully realised our
 expectations. It has already gained a popularity, both for
 general crop and as a prizetaker, which few recent introduc-
 tions can lay claim to. From all parts of the country we con-
 tinue to receive eulogistic testimonials, thus proving it to be a
 decided acquisition. It has a very handsome globe-shaped
 bulb, with exceedingly small neck, and of a beautiful pale
 straw colour, it possesses mild flavour and excellent keeping
 qualities. The "Excelsior" has been grown alongside the
 most popular varieties of Spring and Winter Onions, and proved
 superior in every respect, many specimens weighing over 2 lb.
 For Exhibition purposes it will undoubtedly supersede all
 others.

First class Certificate of Merit, November 16, 1880.

Price per packet, 1s. 6d.

ORCHIDS.

The Largest and Best Stock in Europe of
 good Established Plants.

Tens of Thousands of Plants to select from.

MR. WILLIAM BULL

Pleas to intimate that his Orchid-houses are always
 quite a sight, from the large number of plants in flower,
 and he will be pleased to show them to any one inter-
 ested in this beautiful class.

MR. WILLIAM BULL

Recommends those desirous of having their Houses
 gay with Orchid flowers, to purchase good established
 well-cultivated plants, which bloom well, are far more
 satisfactory, and comparatively cheaper than newly
 imported or semi-established plants.

Establishment for New and Rare Plants,

MAW AND CO., Penthal Works, Broseley, Shropshire.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler with the following improvements—viz. the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Size.	To heat of 4-in. Pipe.	Price.
High. 20 in.	18 in.	15 0
		300 7 0
20 "	20 "	400 8 0
20 "	18 "	300 9 0
24 "	24 "	700 12 0
24 "	22 "	550 14 0
24 "	24 "	1000 16 0
24 "	21 "	480 20 0
28 "	28 "	600 25 0

Larger sizes if required.

From **MR. CHARLES YOUNG, Nurseries, Barkham Hill, S.W.,**
May 20, 1873.
"Having given your Patent Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Lists of sizes and shapes. ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.
J. JONES AND SONS, Iron Merchants, 6, Bankside, South-west, London, S.E.

Illustrated Circulars post-free. **STANDARD MANUFACTURING COMPANY,** St. Alkmund's Churchyard, Derby. Sold by the principal Ironmongers and Seedsmen.

RIPPINGILLE'S PATENT PROPAGATING PLANT FRAME.

Heated by Patent Stove, to Burn Petroleum and other Mineral Oils.

The Simplest and Best Invention ever introduced for RAISING SEEDS, STRIKING CUTTINGS, &c.

The only frame of the kind for Outdoor Use.
The above Illustration represents Rippingille's Patent Outdoor Plant Frame, which is so constructed that it will not blow out during the roughest weather; it is made upon the most scientific principles, but is so simple that it is impossible to get out of order, and an economy is unequalled, the cost of burning being only FROM A FARTHING TO A HALF PENNY PER DAY.
The Stove will burn from thirty-six to forty hours without attention. The product of combustion does not enter the Frame at all, but at the same time all the heat is completely utilised. It is disconnected from the Frame for trimming the wick, lighting, replenishing with oil, &c. The top of frame slides off on other way, and is equally movable; this is very convenient for planting or removing Cuttings; Watering, Ventilation, &c. The heat obtained is from 70° to 100° Fahrenheit, which is considered the best temperature for forcing or propagating purposes.

PRESS OPINIONS.
"The Journal of Horticulture."—"A valuable aid to Amateur Gardeners."
"The Gardener."—"It is a handy Plant Frame, likely to be much used when better known."
"The Gardener's Magazine."—"Rippingille's Propagating Frame is a most valuable invention."
"The Horticultural Record."—"This Frame ought to be in every small Garden, so that its owner could raise his or her flowers from seeds and cuttings, which gives so much greater zest to the pleasures attached to Amateur Gardening."
Sent packed free and carriage paid to any Railway Station in England.

RETIREMENT OF MR. THOMAS MOORE.

On the retirement of Mr. THOMAS MOORE from the joint Editorship of the *Gardeners' Chronicle*, a committee was formed for the purpose of arranging for a suitable recognition of his eminent services to Horticulture and Botany, as well as of his disinterested devotion to social and philanthropic movements in connection therewith.

The step thus taken has met with general approval, and the Committee have obtained many promises of support from horticulturists and florists, so that it is anticipated that a substantial presentation may be the result of this endeavour. It is, however, important that all who sympathise with this proceeding should manifest their sympathy as promptly as possible.

Mr. Moore is so well known, and his labours are so generally appreciated, that to urge the merits of the cause would be a waste of words. But it is pertinent to this appeal to say that the Committee have definite objects in view, and wish to carry them into effect without delay. The Committee are of opinion that the subscriptions of Gardeners—without regard to their respective amounts—would be not only appropriate to the occasion, but peculiarly gratifying to Mr. Moore.

Intending subscribers to the MOORE PRESENTATION FUND are desired to communicate to the Treasurer or Secretary, or any member of the Committee, naming the amounts promised by themselves and their friends.

Cheques may be crossed Union Bank of London, and Post-office Orders may be made payable at the Chief Office in London. Subscribers who cannot conveniently send Cheques or Post-office Orders may remit their amounts in Postage Stamps, in which case it will be advisable to forward them direct to the Secretary.

WILLIAM PAUL, Waltham Cross,
Honorary Treasurer.
SHIRLEY HIBBERD, 15, Brownsdown Park, London, N.,
Honorary Secretary.

 - WILLOW—Bedford or Huntingdon, 6 to 8 feet, 3s. per dozen, 15s. per 100; 8 to 10 feet, 4s. per dozen, 35s. per 100; 10 to 12 feet, 6s. per dozen.
 - " Cereulan, 6 to 8 feet, 3s. per dozen, 15s. per 100; 8 to 10 feet, 4s. per dozen, 25s. per 100; 10 to 12 feet, 6s. per dozen.
 - ASH—(Fraxinus excelsior) atrovirens, 3 to 4 feet, 12s. per dozen, 10s. to 15s. per 100; 4 to 6 feet, 12s. per dozen; 6 to 8 feet, 18s. per dozen; 8 to 10 feet, 24s. per dozen.
 - " spectabilis, an exceedingly fine Ash, which grows with extraordinary vigour, 3 to 4 feet, 6s. per dozen; 4 to 6 feet, 9s. per dozen; 6 to 8 feet, 12s. per dozen; 8 to 10 feet, 24s. per dozen.
 - BEECH—Crested-leaved, a very ornamental tree, 4 to 5 feet, 9s. per dozen; 5 to 6 feet, 12s. per dozen; 6 to 8 feet, 18s. per dozen.
 - " Cut-leaved, very beautiful, 4 to 5 feet, 12s. per dozen; 5 to 6 feet, 18s. per dozen; 6 to 8 feet, 24s. per dozen; 8 to 10 feet, 36s. per dozen.
 - " Fern-leaved, one of the most beautiful small trees grown, 3 to 4 feet, 12s. per dozen; 4 to 5 feet, 18s. per dozen; 5 to 6 feet, 24s. per dozen.
 - " Purple-leaved, the best dark broad-leaved variety, 3 to 4 feet, 9s. per dozen, 60s. per 100; 4 to 5 feet, 12s. per dozen; 5 to 6 feet, 18s. per dozen; 6 to 8 feet, 24s. per dozen; 8 to 10 feet, 36s. per dozen.
 - WEeping, 4 to 5 feet, 12s. per dozen; 5 to 6 feet, 18s. per dozen; 6 to 8 feet, 24s. per dozen.
 - CHERRY PLUM (Prunus Myrtilarum)—Early flowering and very ornamental, fine Standards, 2s. and 2s. 6d. each, 15s. to 24s. per dozen.
 - HOSE-CHESTNUT—Extra transplanted, very fine, well-rooted trees, 8 to 10 feet, 9s. per dozen, 60s. per 100; 10 to 12 feet, 12s. per dozen, 75s. per 100.
 - " Scarlet-flowered, 6 to 8 feet, 18s. per dozen, 8 to 10 feet, 24s. per dozen.
 - ELM—Variegated, Weeping, fine Standards, 5 to 8 feet in stem, 24s. per dozen.
 - " Giant or Huntingdon (macrophylla), 10 to 12 feet, 12s. per dozen, 75s. per 100; 12 to 15 feet, 18s. per dozen.
 - " Silver Variegated, 4 to 5 feet, 12s. per dozen; 5 to 6 feet, 18s. per dozen; 6 to 8 feet, 24s. per dozen.
 - " Scampston's Weeping, the finest Weeping Elm, fine straight stems and good heads, 10 to 12 feet, 24s. per dozen; 12 to 15 feet, 36s. per dozen.
 - MAPLE—Norway (Acer platanoides), 8 to 10 feet, 9s. per dozen, 60s. per 100; 10 to 12 feet, 12s. per dozen.
 - WILLOW—Scarlet Palm, a Willow of extraordinary vigour. The bark of the young wood is of a deep purplish-red in winter, and it bears "lambs tails" in spring of very large size. 4 to 6 feet, 3s. per dozen, 15s. per 100; 6 to 8 feet, 4s. per dozen, 20s. per 100; 8 to 10 feet, 6s. per dozen, 40s. per 100; 10 to 12 feet, 12s. per dozen.
 - EUNONYMUS—radiata, argentea variegata, a very useful plant for edges to winter beds, 3 to 4 ft., 2s. per dozen, 12s. per 100; 4 to 6 ft., 3s. per dozen, 18s. per 100.
 - ELDER—"Sambucus nigra" variegated; a beautifully variegated plant, which fades close up to the sea; 6s. per dozen, 40s. per 100.
 - " cut-leaved—a handsome lacinated form, and like other Elders, extremely useful for planting close to the sea. 6s. per dozen, 40s. per 100.
- A slight extra charge must in some cases be made for packing. Where cash in payment of goods is sent with the order, the amount for postage may be forwarded in stamps after despatch of goods. All the above prices are subject to the discounts named at head.

THE GENERAL AUTUMN LIST

will be forwarded Gratis and Post-free to all applicants.

Trade Terms on application.

THURSDAY NEXT.GREAT CATTLEYA SALE.

SECOND PORTION OF

CATTLEYA LABIATA PERCIVALIANA

(Rehb. f.)

TRUE AUTUMN-FLOWERING LABIATA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. SANDER, on THURSDAY NEXT, March 2,

THE SECOND PORTION OF A WONDERFUL IMPORTATION OF THIS MAGNIFICENT CATTLEYA.

It is well-known there are numerous varieties among the old *Cattleya labiata*, such as *PESCATOREI*, *PICTA*, &c., and the varied Bulbs show that many varieties are among the lots offered. It is true Autumn-flowering. Flowers will be on view of this the finest Brazilian *CATTLEYA*—sepals and petals broad, deep rose or light purple; lip broad, large, splendidly fringed, lower part deep velvety-purple: in some varieties quite one-half of the lip is dark; throat golden-yellow. We have never previously seen imported a *Cattleya* so floriferous: there is hardly a Bulb which has not flowered, and whose spike does not show three and four flower-seats. Mr. Seidl, the lucky discoverer, states that one mass alone had 380 flowers fully expanded when collected, and many others had faded. This piece had to be cut into four, to facilitate its transport to the far-distant coast. We are extremely pleased at being able to offer it to the public, having looked for it without success for many years. The green and red-leaved varieties are among the importation, which altogether is in simply superb condition.

CATTLEYA TRIANÆ, ALBA, DELICATA, &c.,

from Mr. Schmidtchen, and from the same locality whence our last year's importation came, many of which have flowered, and are unsurpassable. The importation consists of grand masses, in extraordinary health.

CATTLEYA DOWIANA
CATTLEYA ELDORADO
CATTLEYA WALKERIANA

CATTLEYA DAYANA
CATTLEYA MOSSIÆ
CATTLEYA SKINNERI ALBA.

ONCIDIUM LANCEANUM—grand lot, with extra large leaves, and consisting of finest varieties.

ONCIDIUM MACRANTHUM HASTIFERUM—from Mr. E. Klaboch.

LÆLIA FLAVA,
very fine lot.

MASDEVALLIA SPECIES,
lovely rose-coloured.

CATTLEYAS from the Brazils, sent home as **AMETHYSTOGLOSSA**.

On view morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

This, the perfection of frame Cucumbers, is a cross between Telegraph and Tender and True; in form it has a resemblance to Telegraph, but is of a darker green and much longer—fruit 31 inches in length having been cut from it. In flavour it is superior to Tender and True, but its chief recommendation is its marvellous productiveness, in which it excels everything that has come under our notice, as many as 300 and 400 fruit having been cut at one time from twelve plants, in a 3-light pit 3-quarter span.

For succession it is unequalled, bearing as abundantly at Christmas as Midsummer; and in addition to its handsome form and lovely colour, it is a variety that seldom produces seeds, not one in a hundred containing a trace. This peculiarity has delayed sending out the stock for a year or two, and at one time it was so nearly lost that only by striking cuttings could it be preserved.

Retail Price per Packet, 3s. 6d.

THE DESIDERATUM IN POTATOS. SHARPE'S DUKE OF ALBANY.

The Editor of the *Gardeners' Chronicle*, in the number for September 24, 1881, makes the following remarks in his report of the International Potato Exhibition, held at Manchester:—

"But we want other improvements; we want more large cropping, earlier kinds, and of the late sorts' considerable disease-resisting powers. First early sorts are rarely affected by the destructive fungus. Their season is short, their haulm growth usually of a medium character, and, as a rule, they ripen ere the disease becomes dangerous. Large cropping kinds, that will give a big bulk of good tubers capable of carrying on the useful supply for the family, or for the nation till Christmas, yet lifted ripe in August, would be an immense boon; and these, it is hoped, may come soon, because well-directed efforts in the shape of cross-fertilisation to secure the desired end are being made. . . . Although no special prizes were offered for these, there can be no doubt but that the special encouragement given to new sorts will tend to promote that desirable object."

Duke of Albany so exactly corresponds to the requirements above indicated, that had it been written for us as a description, it could not have been more exact.

Duke of Albany is a white Kidney—a cross between Beauty of Hebron and Early Goodrich; it has a short haulm with a pale flat leaf, is quite as early as Myatt's Prolific; as large in size, and as heavy a cropper as Magnum Bonum—than which it is ten weeks earlier; it is ripe early in August, and will keep until Spring, being a first-class Potato from the middle of July until the month of March. For flavour, quality of flesh, and good cooking properties, it leaves nothing to be desired.

Retail Price per Pound, 6d.

CHARLES SHARPE & CO., SLEAFORD.

ORCHIDS.

The Largest and Best Stock in Europe of good Established Plants. Tens of Thousands of Plants to select from.

MR. WILLIAM BULL

Begs to intimate that his Orchid-houses are always quite a sight, from the large number of plants in flower, and he will be pleased to show them to any one interested in this beautiful class.

MR. WILLIAM BULL

Recommends those desirous of having their Houses gay with Orchid flowers, to purchase good established well-cultivated plants, which bloom well, are far more satisfactory, and comparatively cheaper than newly imported or semi-established plants.

Establishment for New and Rare Plants, 536, KING'S ROAD, CHELSEA, LONDON, S.W.

Mr. WILLIAM BULL'S Establishment for New and Rare Plants, King's Road, Chelsea, London, S.W. NEW POTATO—PREMIER EARLY WHITE.—This is a Potato of great merit, and proved to be the earliest in culture, 20s. per ton. It is an Excelsior and Snowflake. The tubers are round and handsome, having small eyes not indented, and all but level with the surface. Its skin is rough, and of a deep red colour, and very floury when cooked. The haulm is also very dwarf, as dwarf as Smith's Early, so that the Premier is well adapted for Forcing. Price per pound 3d. Sent out by DOUGLASS AND LAIRD, Edinburgh.

TO MARKET GARDENERS, GENTLEMEN GARDENERS, and others about to commence business.—JAMES FARRAR AND CO. have to announce the publication of their Trade Seed CATALOGUE, which will be forwarded post-free upon application. Seed Warehouse, Furnace Street, Bishopsgate, London, E.C.

QUICKS, extra fine transplanted, at 15s., 20s., 25s., 30s., 35s., 40s., 45s., 50s., 55s., 60s., 65s., 70s., 75s., 80s., 85s., 90s., 95s., 100s. per 100. FINE, fine transplanted Scotch, 1 1/2 to 2 and 2 to 3 feet. ASH, fine Mountain, 2 to 10 feet. FERNETS, fine Black Italian, 12 to 15 feet. ASH, transplanted, 2 to 3 1/2 feet, at reduced price. Price on application. Address WM. WOOD AND SON, The Nurseries, Maresfield, Uckfield, Sussex.

CHEAP OFFER OF SEED POTATOS and WINDSOR BEANS. POTATOS—Myatt's Ashleaf, 2s. 6d. per Cwt.; Magnum Bonum, 3s. 6d. per cwt.; Schoolmaster, 4s. 6d. per cwt.; Reading Ashleaf, 4s. per cwt.; Veitch's Ashleaf, 4s. per cwt.; Veitch's Ashleaf, 4s. per cwt.; Rivers' Ashleaf, 3s. per cwt.; TAYLOR'S BROAD WINDSOR BEANS, 6s. per bushel. Bags extra. Cash with order only. Apply to R. GUST & CO., Nurseryman, Spalding.

CAULIFLOWER PLANTS, Early London, C. Walcheren, and Large Axial, 2s. per 100; Veitch's Autumn King, 4s. per 100; Red Pickling CABBAGE PLANTS, Bath Cos., and Lee's Immense Hardy Green CABBAGE LEAF LETTUCE, 4s. per 100; 20s. per 100; Sugarloaf, English, Rainham, Schilling's Queen, Nonpareil; SAVOY, BRUSSELS SPROUTS, Green Curled KALE, 6s. per 100, 3s. per 100; 2s. per 100; Elitee BROCCOLI, 8d. per 100, 6s. per 100, 4s. per 100, 2s. per 100. Cash with order or Banker's reference. List on application. All above Plants warranted sound, sown and strong, from the open ground (not raised in frames). No charge for Package. EDWARD LEIGH, Wrotham Farm, Dun-fold, Godalming, Surrey.

Gynura aurantiaca. H. MAURER, NURSERYMAN, Jena, Germany. Will be prepared to supply plants of the above splendid species (true) in April, at 5s. each. For beauty of foliage it has perhaps no superior. The entire surface of the stems and leaves are covered with innumerable hairs, soft to the touch, and of a exceedingly rich violet. The flowers are of a brilliant orange, and contrast charmingly with the beautiful velvety foliage of the plant. Orders booked now. They must be accompanied either by stamps or Post-office Order.

SPECIAL OFFER, for one month, to the Trade.—JOHN HAYWARD, The Nurseries, Chadle, near Manchester, offers the following in strong, healthy plants, in quantities not less than 50 of each, at 8s. per 100, 4s. per 50, for cash with order.—PANSIE, Blue King, Mrs. Felton, T.ory Comet, David Smith, David Caven, George Vair, Mrs. Finkney, W. J. Adams, A. A. Allen, America, Acme, Alpha, Holmwood, Piling Park, Sovereign, PHLOX, leading sorts, 20s. per 100. CARNATION, Old Clove, 2s. per 100.

MAGNUM BONUMS.—50 Tons Magnum Bonum Seed POTATOS to offer, good sound hand-picked tubers, free on Rails in lots not less than 3 Tons, at 6s. per Ton. Other varieties sold in 100 lb. bags. Send for CATALOGUE free upon application to C. FIDLER, Potato Grower, Reading, Berks.

Special Offer to the Trade. P O T A T O S. MYATT'S PREMIER EARLY KIDNEY, 2s. 6d. per 100. MAGNUM BONUM 3s. 6d. per 100. SCHOOLMASTER 4s. 6d. per 100. CHAMPION 5s. 6d. per 100. VICTORIA REGENT (Gordon's new Seedling, direct from its raiser) 6s. 6d. per 100. New Stocks at cost price, for nett cash, free on Rails here. W. W. JOHNSON AND SON, Seed Growers and Merchants, Boston, Lincolnshire.

ALL KINDS OF Agricultural, Garden, and Flower SEEDS Of Best Quality.

A FEW OF THE SELECT SEEDS WE ARE NOW NOTED FOR:—

- BROCCOLI, Covent Garden White.
- ... Evesham Giant White (very protecting).
- BRUSSELS SPROUTS, Covent Garden Strain (the best sarsy grow).
- CELERY, Covent Garden Red (large and very solid).
- COLEWORT, Harty Green (hearts like a Cabbage).
- PARSLEY, French or Moss-curled (superior).
- PARSNIP, Hollow Crowned, select stock.
- SAVOY, Covent Garden Drumhead.
- VEGETABLE MARRROW, long white ribbed (the largest and best).

FLOWER SEEDS.

- BEGONIA, choicest tuberous-rooted from splendid collection.
- CANDY TUFT, New Carmine (splendid distinct colour).
- CARNACTION, The Ionic (the best white); choicest mixed.
- CYCLAMEN, Covent Garden strain (fine habit and colour).
- PAHELIA, See list (free from all parasites in cultivation).
- GERANIUM, Ivy-leaved (choicest mixed).
- DOBELIA SPECIOSA, true dark (saved from cuttings).
- MYOSOTIS BISTIFLORA, true.
- ... AZORICA, true.
- POPPY, Dwarf French Ranunculus (all colours and select double).
- ... Carriation-flowered (all colours and select double).
- PYRETHRUM, Single (choicest hybrid).
- SUNFLOWER, tall dark centred.
- ... yellow centred.
- ... Double orange.
- WALLFLOWER, Harbinger, early flowering dark.

THE **Gardeners' Chronicle.**

SATURDAY, FEBRUARY 25, 1882.

THE FORCING SEASON.

WITH the exception of the paucity of sunshine and the prevalence of fogs, the winter so far has been favourable to early forcing. Fortunately, too, these drawbacks are less felt in the earlier than in the later stages of growth. During the former, in fact, growth is more a manifestation of stored up force, the result of the previous season's work, than a building up of new, independent products; hence obscure light and the comparative absence of direct sunshine inflict but little injury on vegetation in its earlier growths. On the contrary, under certain conditions, as recently shown in our pages and abundantly illustrated in practice, tender dormant crowns and semi-dormant buds may be stimulated rather than retarded or injured up to a certain stage by semi-darkness, or the total absence of light; hence, with the exception of very early Peaches, Pines, Cucumbers, and Melons, probably vegetation has suffered but little by the comparative sunlessness and abnormal foginess of the winter.

Be this as it may there can be no question that the mildness of the winter has resulted in an enormous saving of coal. The importance of the saving can hardly be exaggerated in a season like the present, while horticulture in nearly all private places is suffering more or less severely through the general depression of agriculture. Next to labour probably coal is the most expensive item in horticulture. It is, therefore, most fortunate that this far coal bills have been a half or three quarters lower than the average for December and January. In gardens where little or no forcing is indulged in coal bills have been well-nigh abolished. This fact is important in other ways than the mere saving of coal or money. Occurring at a time when many are meditating a reduction of their gardens, or the giving up of gardening for a time altogether, the saving of money in coal may help many to tide over the difficulty and keep up their gardens as heretofore. Already there are signs that the agricultural depression has reached its lowest limits and that things have begun to mend. We hear that the flocks and herds, notwithstanding a few outbreaks of disease, seldom were more thriving. It is certain that the Wheats never looked better.

Rent reductions have also reached their lowest limits, and farmers and others are once more indulging reasonable hopes that as the seed time so far has been so favourable a good harvest may also follow. Neither has the saving of coal through the mild winter been enjoyed only in gardens. The owners, occupiers, and workers on land, as well as the dwellers in towns and cities, and our trade and commerce, have all been assisted through a trying time by the boon of cheap coal. It has been affirmed, with some truth we believe, that commercial horticulture has suffered less than many other industries during the general depression, though the losses during the two

THE QUEEN'S SEEDSMEN,
and by Special Warrant to
H.R.H. THE PRINCE OF WALES,
READING, BERKS.

severe winters must have been serious, as well as the extra cost of maintenance and the diminished trade. We know for a fact that it has suffered, and that the saving of coal bills through the mildness of the winter will prove a most welcome boon to our nurserymen and florists.

What is economised in fuel will be expended in other and more profitable directions, and ultimately part of the benefits will be reaped by the nation at large. In this case there will be a double benefit; for less coal consumed means cheaper coal to purchase, and as coal is one of the most costly items in horticultural productions, such commodities are likely to prove more plentiful and more cheap, owing to the mildness of the season.

A mild winter also saves labour as well as coal; it becomes continuous, and not intermittent, and thus more work is done: the labour of covering and stoking are also reduced or abolished—these are often serious and expensive items in severe seasons. And then, too, time is saved as well as labour. It is immense gain in horticulture to be able to keep quite abreast or slightly ahead of the work to be done. Managed thus, horticulture may be carried on at little more than half the trouble or the cost. There is no work so expensive in its performance, so unprofitable in its results, as that which is done a day, or week, or month in arrear.

Those, however, must indeed be unfortunate or incompetent who are not abreast or ahead of their work at this time. Whatever amount of winter may yet be in store for us, the sun from henceforth works for us with increasing power; the heat of the sun carefully husbanded will render less coal necessary, and his increased energy quickens growth to such an extent that much more may be done in a given time than in December or even January. This suggests a large subject that we may probably return to again soon—whether time, coal, labour might not be saved, and equally good results obtained, by quickening the speed of some of our horticultural practices. Tropical produce races from the start to the finish as contrasted with that of more temperate climes, and in this age of telephones and telegraphs, electric light and motion, and rush and run and struggle of and for life, it may be wise and well to see whether weeks and days might not be saved in the production of many of our crops under glass. The idea that the pace kills—that is, weakens overmuch—has been accepted on insufficient evidence, much of which has been collected from conditions widely different to those within reach of the horticulturists of the present day, or, if it is not so, at least increased supplies at a cheap rate can readily be made to compensate for speedy exhaustion of worn-out material.

Thus, even where individual plants are killed in the race of rapid production the killing proves profitable. It does so virtually in regard to Lilies of the Valley, Spiras, bulbs, and other plants by millions annually, and might yield a similar profitable result in regard to other plants. As our material grows the modes of propagation and the means of increase multiply almost to infinity, and as the demands for horticultural products become more urgent, the importance of individual plants sinks into comparative insignificance beside the one great problem of how to reap the largest profits at the least cost in the shortest space of time. A great step would be taken towards the profitable solution of this problem could the orthodox time between the start and the finish be shortened. For example, if Grapes can be finished in four and a-half or five months from the start instead of six, less coal and labour would be needed for their production—and so of other crops. To this end the electric light

may ultimately aid, though the cost of its production at the present time would of course be out of proportion to the results.

By deferring the start for a month, sometimes almost half the coal expended on the entire crop might be saved. The subject of thus economising the cost of production, important at all times, is vitally so in these seasons of severe rural depression, and we shall be very glad to hear what our practical readers have to say on the subject, and especially to chronicle facts relating to the actual periods within which ripe Grapes, Peaches, Cherries, Plums, Apricots, Melons, Cucumbers, Pines, have been cut or gathered from the starting of the buds, seeds, or suckers.

New Garden Plants.

DENDROBIUM LEECHANUM, *n. sp.* (fig. 35.)

A hybrid between *Dendrobium aureum*, Lindl., and *D. nobile*, Lindl., the last being the seed parent. It is well compared by Mr. Swan, who succeeded in raising it, with *Dendrobium splendissimum*, but it deserves a name of its own, as Mr. Swan also

FIG. 35.—DENDROBIUM LEECHANUM.

thinks. The petals are narrower, more acute, very wavy. The lip is lobed, and this reminds one of *Dendrobium aureum*, Lindl. The flower bears the finest white of the best varieties of *Dendrobium nobile*, Lindl., the tips of the sepals, petals, and lip are of a rich rose-purple, and this appeared to me most striking when I opened the box, though it contained but a single flower of the novelty, which is always a very great embarrassment, in this case the less explicable, as it flowers in such profusion, as stated by Mr. Swan. Both sepals and petals are nearly totally rose-coloured outside. The anterior disk of the lip is occupied by a very large-toothed, dark purple blotch. Towards the base runs a broad callous line with fine purple stripes, and there are on each side radiating purple lines running outside. The column is quite green with purple longitudinal stripes, not with an ochre foot as is seen in *Dendrobium splendissimum*. Mr. Swan is very eloquent in pointing out the numerous good qualities of this novel hybrid, the best one being that bulbs of but 4 inches in height produce flowers. I entertain no doubt that Mr. Swan understands keeping the resting stems rather dry, not too wet, as Continental growers the Orchid growers often do. Mr. Swan expressed a strong desire that the new citizen in the State of Orchids might bear the name of Mr. W. Leech, Fallowfield, which we certainly agree to with pleasure. As to the names *Dendrobium aureum* and heterocarpum, we should finally adopt Dr. Lindley's name of *D. aureum*, and sink (as Professor Oliver is accustomed to say) Dr. Wallich's, which was only given to an Oriental drawing, most probably not representing *D. aureum*

at all, but *aureum* B. rhombicum, Lindl. (*rhombeum*, Lindl.), and though published in the same sheet with *D. aureum* yet enumerated after it, and with an unsatisfactory description from want of sufficient documents. *H. G. Rehb. f.* [The chief points in the crossing, sowing, and raising of this and other hybrids was given in our vol. xv., p. 302. Ed.]

LONGICERA ALBERTI, *Rehb. f.*

We have frequently of late had occasion to refer to the flora of Central Asia, especially in connection with the discoveries of Mr. Albert Regel. Of the numerous plants introduced into the Petersburg Botanic Garden by that gentleman, *Loniceria Alberti*, lately figured and described in the *Gartenflora*, is said by Dr. Regel to be the most valuable shrub. It is a very distinct and pretty species of the *Nyctostemum* section, having quite narrow leaves, usually less than an inch long, and rosy, fragrant flowers, about the size of those of *L. Nyctostemum* itself. Seeds of this hardy new Honeysuckle were collected in the alps of Eastern Tarkestan, and plants were raised therefrom in the Petersburg garden, where they have proved perfectly hardy and where they flowered for the first time last June. Here is a translation of Dr. Regel's description:—A dwarf, glabrous, branching shrub, with diffuse, slender, dependent branches. Leaves opposite, glaucous, linear-oblong, rather obtuse, shortly petiolate, entire or furnished with two teeth on each side near the base. Peduncles axillary, shorter than the flowers. Outer bracts similar to the leaves, inner connate, forming a two-toothed involucre half as long as the calyx. Flowers fragrant, in pairs, but the ovaries not united. Corolla rosy-lilac, with a cylindrical tube and an almost regular 5-parted limb. In foliage this is not unlike a *Lycium*, but it grows only 2 or 3 feet high. It has proved perfectly hardy at St. Petersburg.

DENDROBIUM ARACHNITES, *n. sp.**

A curious botanical species with bulbs much like little *Cheerkins*, ultimately furrowed, and exceeding an inch in length. The flowering-stem has no perfect bulb, this swelling later as in many plants of the *Catolopogon* group. The single leaf is cuneate-oblong acute midulate, about 3 inches long by 1 inch in width over the most distinctly stalked base, of this parchment-like texture. The peduncle slightly exceeds the leaf and bears a loose raceme of light greenish flowers having both sepals and petals tailed. The bracts are very narrow, almost linear, apparently persistent, exceeding the stalked ovaries. Lip cuneate-ligulate acute, with three keels from the base to the centre, which are confluent. Column with a membranous toothletted margin around the anther and lower side laminae of rather falcate outline. It was introduced by Mr. Stuart Low from the Philippine Islands. I have a nice living plant at hand, but I am afraid the novelty will create no sensation in the horticultural world. *H. G. Rehb. f.*

ODONTOGLOSSUM ACUMINATISSIMUM, *n. sp.*†
(fig. 34)†

Whether this is a hybrid or a species I cannot say. Its hybrid nature might be inferred from the fact that it came amidst a great lot of *Odontoglossum crispum*, but this proves nothing. If I were to guess, I might conjecture its descent from *Odontoglossum Lindleyanum* and *cristatum*. Be this as it may the plant is remarkably distinct. The great pear-shaped acniphous bulb has three ribs each side, and some of those flat impressions which are so distinct in *Odontoglossum nevium*, Lindl. The leaves are linear-ligulate, acute. The peduncle at hand is a few-flowered raceme, but it may well turn out a panicle, when the plant is more at home in Europe. The stellate flowers are nearly orange, with few large crimson bars. The lanceolate, acuminate, dark yellow lip has a broad cinnamon bar.

*Pseudobulbus aggregatus cylindricus demum laevis, impressis; caule supra basin monophyllis. Folia brevia petiolato cuneato-oblongo acuto uncinato, involucre petalisque longis in apicem versus racemosis. Bractea linearilanceolata ovata pedicellata superstitibus; sepalis petalisque linearilanceolatis, lobello cuneato-oblongo ligulato acuto, apice reflexo, linea callosa confluentibus tenuis a basi in discum; columnae bifidae laciniis lateralibus lideatis, circolo circa andrincium denticulato; filibus viridibus.—Es. Ins. Philippin., imp. cl. Low. *H. G. Rehb. f.**

† *Odontoglossum a subrotundatum*, *n. sp.* (c. hybrid. c. = *Odontoglossum pseudobulbus pyramicum* ancipiti; utrinque cristato, planis, pubulsum impressis. Filis linearilanceolatis racemose (nunc paniculo) panceolatis sepalis petalisque linearilanceolatis acuminatis, lobello subaequali acuto basin flexo, lamella elongata pluridenticulata arcuata; lobis in medium, demum subulatis; columna trigona medio angulata, alis falcatosubulatis denticulatis adveniens in margine inferiori. *H. G. Rehb. f.*

There is a double lamellar keel from the base towards the middle with six to seven teeth on each side. The trigonous column has an angle in the centre, and a fine falcate-semilunar wing each side. This very curious novelty was sent by Dr. Wallace, New Plant and Herb Company, Lion Walk, Colchester. *H. G. Rob. f.*

DIOSCOREA MULTICOLOR. *Lind. et And., Ill. Hort.* 1871, vol. xviii., p. 52, t. 53.

This member of the Yam family was figured in the *Illustration Horticole* from barren specimens, nothing being known at the time of either male or female flowers. A plant has lately produced male flowers at Kew, enabling us to extend the description of an ornamental climber which should in the future occupy a place amongst our fine-foliage stove plants. It appears to be a free grower, the stems twining round their supports, and producing cordate leaves 3 to 5 inches long and 2½ to 3 inches wide, of a rich green, beautifully spotted and variegated with pale spots and blotches, most numerous near the principal veins; the under surface is uniformly pale lurid purple. In the young state a metallic blue pervades the leaves, vanishing with age. The panicle is gracefully branched, the branches (in our plant) numbering twelve to eighteen and measuring from 1½ to 2½ inches, on which the tiny flowers, scarcely a line long, are thickly arranged about eighteen to the inch. The bracts are minute, broadly ovate, lengthened into an acuminate point and closely adpressed to the flowers (in the dried state a slight space intervenes, owing to the shrinking of the perianth tube). The perianth is narrowly campanulate, the dark purple oblong segments equalling only half the tube, which is yellowish-green. The three perfect stamens equal the perianth tube in length, the minute anthers are oblong, and the pollen bright yellow. The female flowers are unknown. It is a native of Northern Brazil, and was introduced from Rio Negro by M. Barazin, in 1868.

The figure cited represents leaves of six varieties—1, *chrysophylla*; 2, *sagittaria*; 3, *melanoleuca*; 4, *metallica*; 5, (sp?) *Eldorado*; and 6, (sp?) *prismatica*: of these our plant most nearly resembles *melanoleuca*. There seems no apparent reason why the first five may not be a variable forms of one species, probably not permanent and unworthy of varietal names.

The sixth appears different, the veins only being partly white and the rest purple; the shape of the leaf also differs somewhat. *R. A. Rolfe, Kew.*

NEPENTHES KENNEDYANA * (fig. 36).

The genus *Nepenthes*, as we have seen, is one that has headquarters in the Malay Archipelago and the large islands of the Indian Ocean, especially Borneo. The species occur also at the extreme end of the Malay peninsula, in Ceylon, and in Cochin China. It is, therefore, quite in accordance with what might have been anticipated, to find the genus represented in North Tropical Australia. The present species, *N. Kennedyana*, comes from Cape York, in North Australia, and is abundantly distinct as a species. Our notes on the living plant were made in Messrs. Veitch's nursery, and have been checked by reference to dried specimens in the herbarium, and descriptions in the works of von Mueller, Bentham, and Hooker. The leaves in Messrs. Veitch's specimens taper at the base into a broadish stem-clasping stalk. In form they are oblong lanceolate, very acute, the parallel veins being nearly equidistant, though this is not so in the dried specimen, wherein, as is usually the case, the veins nearest the margin are much closer together than those near the midrib. The pitchers, which measure over 5 inches in length by 1½ inch in width [less in the dried specimens], are reddish, elongate cylindrical, slightly dilated below the middle, tapering at the base, and with deep, sharply fringed wings; the mouth is oblique, surrounded by a narrow finely-ribbed rim; the throat is glaucous violet; the lid suborbicular, as large as the mouth of the pitcher, glandular on the lower surface, and with a simple spur at the base. *M. T. M.*

A RAILWAY IN THE TREE
TOPS.

The following paragraph, from a recent issue of the *Argos* of Petaluma, California, has lately been communicated to *Notes and Queries*:—"It may not be known outside of the neighbourhood where it is situated, but it is nevertheless a fact that in Sonoma County (Cal.) we have an original and successful piece of railroad engineering and building that is not to be found in the books. In the upper part of this county, near the coast, may be seen an actual roadbed in the tree tops. Between the Clipper Mills and Stewart's Point,

where the road crosses a deep ravine, the trees are sawed off on a level, and the timber and trees laid on the stumps. In the centre of the ravine mentioned two huge Redwood trees standing side by side form a substantial support, and they are cut off 75 feet above the ground, and cars loaded with heavy saw logs pass over them with as much security as if it were framed in the most scientific manner. All roads lead to Rome except this one. The builders never contemplated a terminus at San Francisco, Petaluma, or Chicago, but merely to convey heavy timber from the woods to their mill. There are many places in our Redwood forests where this example might be followed profitably, as it would be cheaper to grade

THE AMARYLLIS.

ADMIRERS of the *Amaryllis* cannot have forgotten the large collections of these plants exhibited in London from the Chelsea nurseries of Messrs. James Veitch & Sons during the early months of the past year. Since that time a new house of considerable dimensions has been built specially for *Amaryllis*, and seems to be very well adapted for their culture. It is a span-roofed structure, in two divisions, and furnished with beds in the centre, as well as along the sides. Besides being efficiently heated with 4-inch pipes, there are also two rows of inch pipes fixed near the base of the rafters; and these two pipes, heated on one side of the house only, will keep the temperature up to 55° when it has fallen to 35° outside—an interesting fact when it is stated that the house is 70 feet long and 20 feet wide. All the beds are heated with pipes sufficient to do without fermenting material, the pots containing the plants being plunged in spent tan. Referring to the extensive groups of plants exhibited last year, it will be well understood by those accustomed to prepare plants for exhibition that in order to have from 200 to 400 in flower at one time it is necessary to retard some and push others on too fast; the plants have then to be taken out into a temperature near the freezing-point sometimes to get them to the show, which has seriously crippled very valuable plants.

Mr. Harry Veitch, who takes a great personal interest in the *Amaryllis*, has determined not to publicly exhibit them—at least, not to a large extent—this year, but has prepared a large show-house for them in the Chelsea nurseries. There is at present a very brilliant display, which will be kept up during the next two months. There are at present 600 in flower or showing their spikes, and the two houses contain altogether about 6000 bulbs. It is a most interesting and instructive study to trace the lineage of the newest seedlings from the original types and varieties to the present well-formed flowers with broad massive petals like the variety *John Neal*, and a new form with broad petals of considerable substance of a rich crimson colour flushed with lake, named *James Douglas*. *A. ulica* and *A. Leopoldi* gave the size and form to *John Neal*; crossing again with *A. Ackermannii pulcherrima* gave the colour. Both these fine varieties are in flower. Other new varieties are *Coningsby*, purplish-crimson, the centre of the petals marked with lake. The petals are not so broad as some, but it is distinct in character. *Madame Antoinette Sterling* is a fine variety, producing four flowers on a spike; it is from *Thalia* crossed with pollen from *Leopoldi*; and the colour is crimson-purple with whitish margins, and more white in the centre than usual. *Chelsoni* and *Brilliant* are two very fine varieties raised by crossing *Ackermannii pulcherrima* with *pardina*. They are both rich brilliant crimson in colour, the latter having much of the spotting of *pardina*. These two are also remarkable for the small size of the flowering bulbs.

Empress of India is again flowering very freely. This fine variety produces six of its very large brightly-coloured flowers in an umbel. Duke of Connaught is another flower of the type that produces six flowers on one stem, but it is still very scarce. Amongst lighter-coloured flowers *Sybil* is a distinct novelty. The flowers are 9 inches across, petals broad, tipped creamy-white, being curiously flaked and spotted with crimson. The *Syren* is a very fine form of the marginata type, also producing six flowers on a stem. The colour is light scarlet, the edges of the petals broadly marked with white. *Thomas Speed* is another six-flowered form, and one of the best for decorative purposes, as it is so free in growth. *Lucretia* of Connaught produces four flowers on a stem, which are pure white, and very pleasing. Amongst the edged flowers *Cecilia* is a remarkably pretty flower of the *Leopoldi* type. The white is very pure, and the broad well-formed petals are of a rich crimson. *Lady Musgrave* is an older flower, but a fine showy variety of a crimson-scarlet colour. *Boscawen* of Cornwall, a seedling of the *Hon.* and *Rev. T. Boscawen's*, is very fine, and of free growth. The colour is dark purplish-crimson. This variety has been crossed with the Chelsea seedlings, and some very fine richly-coloured varieties are the result. *Sir Garnet Wolseley* is the best of the true scarlet varieties in flower. It is quite a rich bright scarlet.

Of the true *pardina* type *Orsini* is a beautiful flower; it is densely spotted with reddish-

FIG. 36.—*NEPENTHES KENNEDYANA*.

through with a cross-cut saw and lay the ties on the stumps then to remove the trees. We can boast of a broad gauge, a narrow gauge, and a road in the tree tops—yet we are not all happy."

NEWFOUNDLAND TIMBER.—The most valuable timber grown in Newfoundland is the white variety of Pine (*Pinus Strobus*). It is especially prized for the manufacture of lumber. In the Gander country alone Mr. Howley estimates there are 850 square miles covered with this growth easily accessible by means of small boats on the Gander River. The yellow or red Pine (*Pinus resinosa*) is another well-known variety. Neither Beech, Elm, Oak, nor Cedar are found. Around St. George's Bay, and in the valley of the Plumber also, are fine forests of timber. The colony derives no revenue from its forests, which are cut at will by all comers. *Journal of the Society of Arts.*

* *Nepenthes Kennedyana*, F. v. Muell. *Fruchtg.* v. 134; *Benth. Flor. Austral.* vi, 1873, p. 41; Hook. I. in DC. *Prod.* xvii, 102.

scarlet. There is also a goodly number of plants of Autumn Beauty, recently certified. This has many of the characteristics of *A. reticulata*, with the larger better-formed flowers of the ordinary type, and flowers in winter or late in autumn. There are many new seedlings opening their flowers every day, besides a collection of all the best named varieties. Some novel forms have also been introduced from the Continent, and the collection altogether is the most representative one that has yet been formed.

ALPINE RHODODENDRONS.

If *Pinus Cembra*, of which I spoke in a previous article, is the most beautiful tree of our Alps, the Rhododendron is their most brilliant decoration. It bears among our peasants the name *Rose des Alpes*, and is the alpine plant *par excellence*. It occurs indeed in the Pyrenees, but it may be supposed that it migrated there from the Alps. M. Boissier did not meet with it on the Sierra Nevada, nor does it occur in the Apennines. Dr. Christ, of Bâle, believes that this plant is of Asiatic origin, but modified by our climate. Its introduction goes back to the first glacial period, at which time immense glaciers covered the central plains of Europe, and the moraines of these glaciers that rose above their sides were covered with alpine vegetation such as we now see it.

There are in Switzerland two species of Rhododendron and a hybrid variety between the two. The range in altitude of the Rhododendrons averages from 1000 to 2500 metres. They generally form the transition between the forest vegetation and that of the alpine pastures. Dushes of them occur in vast masses, with which nothing else grows. Often they cover abrupt and rocky slopes, and prove of great assistance to travellers in scaling the rocks. It often happens also that isolated masses of Rhododendrons are met with on the great blocks of stone thrown down from above. These blocks in falling have carried with them a little humus filled with seeds of Rhododendrons, so that they retain the covering which characterised them at a higher elevation. It has been said that Rhododendrons grow on the slopes and in the meadows in a northern aspect and avoid a southern exposure. This is a complete error, as I may remind all those who have climbed the Alps and who have observed these delicious plants. The Rhododendrons have no marked preference, except that they love a damp and cool soil. In certain parts of the Ormonts or the Vaudois Alps they adorn the northern slopes it is because they alone are sufficiently moist; but I have seen clumps of Rhododendrons exposed to the full south.

R. hirsutum is so little affected by the sun that it descends into the plain in certain localities. It is likewise found in abundance on the rocks which border the lakes of Thun and Lowerr. At Vira, on the borders of the Lago Maggiore, it is met with at a height of 2400 metres braving the rays of the Italian sun. My friend Dr. Silvio Calloni saw, at the end of last October, on the borders of the Lago Maggiore, a group of Rhododendrons the flowers of which were completely open, and as beautiful as in July. In this delightful country of the lower Ticino, where the flora of the glacial countries mixes with that of sunny Italy, where the *Anemone* of the high Alps, the Edelweiss, the *Primula viscosa*, and many other alpine plants, mingle with the Fig and the Pomegranate—where the *Aroële* (*Pinus Cembra*) is associated with the Chestnut, and the Larch with the Olive—we find the alpine Rhododendron nearly everywhere. This is explained by the fact that in these countries water is very abundant, and descends from the Alps during the great heats. Evaporation goes on much more freely under a high degree of heat, and the atmosphere is never dry, as it is in the Canton of Valais, where the flora is well-delimited.

R. ferrugineum, L., is the most beautiful species as far as regards the leaves and habit. The leaves are large, of oblong form, rusty-brown underneath (hence the name *ferrugineum*), and of a dark shining green above. The foliage recals on a small scale that of the Laurel, and on a large scale that of the Myrtle. From this point of view alone this species is worth cultivating. But what gives it its charm and constitutes its greatest attraction are its flowers. Grouped in little terminal clusters of a bright rose colour, and of a very graceful shape, these charming flowers are the admiration of all travellers. It is a species for the most part peculiar to granitic soils, but it is occa-

sionally met with on limestone mountains. It is certain that the summits of the Jura which surround Geneva contain it in great abundance.

Rhododendron ferrugineum often ascends to higher elevations than *R. hirsutum*, but it never descends into the plain. It is also more difficult to cultivate.

In *R. hirsutum*, L., the foliage is bright green, and covered with hairs, the leaves are smaller and less beautiful than those of the preceding species, but the flowers are even more beautiful. The colour is much brighter than in *R. ferrugineum*, and it seems to flower more freely. This species grows on limestone rocks, and descends into the plains, and flowers on the borders of some of our lakes.

R. intermedium is rarely met with in Switzerland. It is a hybrid between the two preceding species, of which it combines the characteristics. M. Paris, a nurseryman of Geneva, cultivates some fine examples of it.

R. chamæcistus, L., is a charming Tyrolean species, the flowers of which are quite different to those of the other species, *Cistus*-like in shape and of a beautiful rose-colour. This species is very free-flowering but its foliage is small and not ornamental.

The white flowered Rhododendron is a very beautiful variety that is rarely met with in our Alps. M. De Candolle has from time to time distributed seeds to the directors of various gardens, but unhappily these gentlemen have not informed him if the seeds have germinated. If any of your readers can supply information on these points I should be gratified if they would do so, as it will be interesting to know if the peculiar characters of this extraordinary plant are reproduced by seed.

The Curé of Salvan, in the Valais, has in his garden a magnificent specimen of white Rhododendrons (of a very pure white), which flowers abundantly every spring.

Rhododendrons are exceedingly capricious and difficult to cultivate. Nevertheless they may be acclimated if care be taken to study the conditions under which they grow naturally and to imitate them. Generally they like a light, porous, and damp soil. *R. ferrugineum* grows generally on the granite and the other generally on the limestone soil, though there are sometimes exceptions to the rule. Whoever has a rock-work can have Rhododendrons upon it. In the rock garden at Valleyes (Vaud), M. Edmond Boissier possesses a fine collection of Rhododendrons which flower abundantly every year and are very thriving. The botanic garden at Geneva possesses a very beautiful specimen, 0.75 m. in height, which is covered with flowers every year. We have also nursery clumps covered with buds. M. J. Paris, nurseryman, has a large quantity growing in pots, and which sometimes flower when thus grown. To succeed well a mixture of leaf-mould, peat and sphagnum, moss and sawdust must be used, with a little sand, granitic or calcareous according to the species. Young plants are potted in this soil, raised in pots, until they are strong enough to flower in the open ground. Then they are placed on the rockery in a position well exposed to the light, well drained and frequently watered. In winter they may be covered with branches of Pine, but this would not be necessary in England. It is a long tedious process to secure them from seed. But it is not always easy to raise young specimens of Rhododendrons in the Alps. It is useless to look for young plants among the great masses of Rhododendrons on the stones, or the rocks covered with these shrubs. They must be sought in the sandy wastes that border the torrents on the edge of the moraines and in the pasturages bordered by the masses of Rhododendrons. But it is especially in the sands that the seedling plants are met with in abundance. On the Pennine Alps in the Valais there are great tracts of micaceous sand brought down by the torrents. In this sand there are hundreds and thousands of young plants of Rhododendron ferrugineum. These sands cannot supply the necessary nourishment for the plants, hence they never become covered with masses of Rhododendrons. The little plants, when at the age of five or six years, perish and get burnt up; thus it is a positive advantage to transplant the plants to a better soil, where they will not fail to succeed. Such sands are also met with near the Lake of Thun, and in these *R. hirsutum* as well as *R. ferrugineum* grows. I have never attempted to multiply these plants by grafting, but I am told that this plan is not without good results. *Henry Correvon, Inspector of the Botanic Garden of Geneva.*

PLANT LABELS.

HAVING occasion to use some thousands of labels in my field and wood garden, and not having found one which answered all requirements, I suggested to the secretary of the Society of Arts to offer a prize to be provided by me. The Council agreed last year to offer a medal and a prize of £5. The reason why the Council of the Royal Horticultural Society was not applied to in preference is that horticulturists had already tried their hands on the subject, while to the large body of members of the Society of Arts, many of them with mechanical and inventive power, it was new ground. A number of labels were sent on competition, some quite new—to me, at least—others of different degrees of merit, others showing great ingenuity, but equal ignorance of what hardy plant labels are exposed to when in use. The medal and prize have been again offered for labels sent in before May, 1882. The labels sent in last year have most of them been exhibited in the arcade of the Royal Horticultural Society.

We have some zinc labels, made by Yates, I believe, on Rose trees, which are perfectly legible after fifteen years' exposure, while some in the cool Orchard-house have become indistinct in less than two years. We have tried heating the labels after writing, the better to fix the ink, and have varnished them afterwards; but the writing still is not as clear as could be wished. One of the most serviceable upright zinc labels I have seen at Mr. P. Neill Fraser's, near Edinburgh; he uses them extensively. They are made of stout zinc, 9 inches long, and $\frac{3}{4}$ inch wide; they stand well up from the ground, and are not pushed out by frost; they were not exhibited. Among the best which were shown were ordinary zinc labels hung on galvanised iron stout wire.

Mr. Wolley Dod gave me an ingenious label which I have tried with success, and which is useful when you have a Hazel in the hedges; a stick is cut into about 1 foot lengths, and a slice at the top taken off sufficiently long for the writing. Mr. Ewbank has improved on Mr. Wilson Saunders' good old label; he uses a small wooden label with two galvanised iron supporters; the label is painted white, and when used a thin coating of black paint is put on; the writing is done with a painted stick—this, by removing the black, shows the letters in white. Col. Trevor Clarke has a small wooden label stuck into an Elder stick to raise it up, the point of the label sticking in the pithy centre of the Elder.

There appears to be a number of serviceable labels for permanent use: but what is required in addition is a cheap rough-and-ready label, to be used when putting in a number of plants with little time to do it in, and this, I think, to be sought in some modification of the present wood labels. Among the wooden labels exhibited which were new to me were Teak wood labels, from Mr. Johnston, of Renfrew, and Holly and Boxwood labels from Messrs. Wolstenholme & Son, of Manchester; these two last were cheap, and found favour with the committee as far as appearance went; Mr. Joad, whose death we have lately had to deplore, was much taken with them, and I know that many orders have been sent to the manufacturers. I have been trying these labels carefully in frames, and have exposed them to the severest test in a cool damp Orchard-house. The Holly wood is more affected by damp than the Box, soon becoming mouldy; the Box is discoloured after a longer time. Remembering that the committee in their report had suggested that some preparation should be used to make labels waterproof the words of the report were these—"Wood is probably the cheapest and best material for cheap labels. It is at present liable to the objection that the part in the ground rots, and the writing on the label becomes illegible. If by some process, such as perfect kyanizing, or treatment with paraffin, these objections could be removed, an excellent label would be the result.

In accordance with this suggestion I got some friends to dip for me in their laboratory some of the Holly and Boxwood labels in hot paraffin (I should say, as it has been confused with paraffin oil, that paraffin is a hard white substance, which, as its name denotes, does not change, and can have no injurious action on plants); the result was promising, but the small quantity of paraffin absorbed showed that the labels could not have been dry. Some thoroughly dried Boxwood labels have since been soaked for forty-eight hours in hot paraffin, of which they absorb

about 12 per cent.; these have so far stood the severest tests in the cool Orchid-house, and have the merit of not requiring any paint, the writing both in ink and in gardeners' pencil being easy, and showing clearly. Having plenty of gardening work I cannot undertake the label experiments, but strongly recommend label manufacturers to take them up. Paraffin is not now an expensive material. As it is not always easily procurable I have ascertained that Price's Patent Candle Company will supply it to label makers of sufficiently hard quality at 5d. per pound. I send specimens of labels—Hollywood and Box, as supplied by the makers; Hollywood exposed in damp Orchid-house unprepared; Boxwood exposed after being paraffined. The subject excites interest abroad as well as at home. I have received a paper from M. C. Joly, of Paris, on *Les Etiquettes Horticoles*, which carefully sums up the merits and demerits of the labels now in use. *George F. Wilson.*

THE TONGA PLANT.

In consequence of the statement made by me in my note upon the Tonga plant on p. 180 of this volume of the *Gardeners' Chronicle*, that *Rhaphidophora pinnata* was the same plant as *Epipremnum mirabile*, I have received from Mr. Lynch, the curator of the Botanic Garden at Cambridge, a fine flowering specimen of an Aroid that is grown there under the name of *R. pinnata*, but which is in fact the Indian *R. decursiva*, and is quite distinct from the Tonga plant. As I have no doubt that *R. decursiva* is also grown at other places under the wrong name of *R. pinnata* (it was so named at Kew a few years back), and cultivators having it so named may fancy they have the Tonga plant, a few words upon the most striking distinctions between the two plants may not be out of place.

The Tonga plant, *Epipremnum mirabile*, Schott (synonyms, *Rhaphidophora lacera*, Hassk., *R. pinnata* and *R. vitensis*, Schott), is distinguished by having its adult pinnatifid leaves cut down to within about $\frac{1}{2}$ — $\frac{3}{4}$ inch of the midrib; the segments are of nearly equal breadth throughout, and have one nerve up the centre of each, which runs out to the apex without branching, merely giving off slender veins, or in the case of two or more segments being united into one, there are two or more nerves in it, as many in fact as there are segments united, but the nerves are quite separate, and run from the midrib to the margin without branching; the leaf is also well characterised by the presence of numerous small perforations and pellucid spots, chiefly scattered along the region of the midrib, which are well seen if the leaf be held up to the light. But in *Rhaphidophora decursiva* the adult leaves are cut into segments right down to the midrib, the segments are broader at their middle than at their base or apex, and the rib of each segment divides into three near its base; there are no perforations or pellucid spots in the leaf.

When in flower the two plants may be readily distinguished by the structure of the ovary and number of ovules; in *R. decursiva* the ovary is incompletely 2-celled, with numerous ovules, whilst in the Tonga plant it is 1-celled, with only two basal ovules. *R. decursiva* was described and figured some years back in Regel's *Gartenflora*, vol. xiii., p. 5, t. 423, as *R. dilacerata*, C. Koch. On what authority Regel quotes it as *R. dilacerata*, Koch, I do not know, as I cannot find that Koch has anywhere described it under that name; but I presume that Regel thought it to be the same as *Monstera dilacerata*, Koch, and changed the genus without changing the authority for the specific name. As to *Monstera dilacerata* if any readers of this should possess that plant I should deem it a favour if they would send me a specimen, as the only specimen I have seen is the type specimen in Koch's herbarium, which consists of a bit of a juvenile stem and a few leaves only, but they are quite different from those of *R. decursiva*, and more like the juvenile form of leaf of the Tonga plant. *M. E. Brown, Herbarium, Kew.*

BOTANIC GARDENS, CAPE TOWN.—Mr. Robert Templeman, who has managed the seed and plant sales for several years, has now retired to establish a business of his own; and this department of the botanic gardens will henceforth be under the charge of Mr. Stephen Solly, son of Mr. S. Solly, of Akeley, S.E.

The Nursery.

MULCHING THE ROOTS OF ROSE STOCKS.—Not many Rose growers take the trouble to mulch the surface of the ground between the rows of Rose-stocks, as is done by Mr. D. S. Thomson, of the Wimbledon Nursery. Mr. Thomson finds it pays better to grow strong healthy Roses at a trifle more expense than to grow cheaper ones, which in the end are less satisfactory. When the stocks are planted the ground is covered with half-rotted litter to a depth of about 3 inches, and there remains during the whole season. It is a warmth and protection to the roots of the stocks, is conducive to the formation of healthy fibrous roots in greater number than would otherwise be obtained, and prevents evaporation in summer, by which the roots of the plants are kept in a medium moist state, and their leaves clean and healthy. It must not be supposed that this system is confined to the cultivation of a limited stock of extra fine plants, all the breaks of Rose-stocks in the nursery are so treated; and, after all, the labour is little compared with the excellent results obtained from the system.

ROSES FROM THE GENOÈSE RIVIERA.—We have received from Dr. Bennett some lovely cut blooms of three of the Roses mentioned by him in our last issue (p. 220) as flowering in the open air in his garden at Mentone. Of Safrano and Madame Falcot we need say nothing as to their qualities, but the flesh or light salmon-coloured *Mlle. Nabonnard* is not so well known, and we would add as to this that the blooms are large, very pleasing, and deliciously but not strongly scented.

THE SHEEN NURSERY.

This interesting nursery establishment, the property of Mr. F. R. Kinghorn, is situated in the centre of one of the most populous and fashionable districts in the vicinity of the metropolis, and is but a few minutes' walk from Richmond Station. The main walk of the nursery runs north and south from the Richmond Road to the South-Western Railway. Within the nursery gates a semicircle is described which is planted with ornamental and flowering shrubs, which gives the entrance an appearance so attractive that the show-houses, containing so many choice Palms and foliage plants, are closely rivalled by the unusual display of flowering shrubs in front of them. Notable among the latter are two extra large bushes of *Tyrus japonica* and *P. japonica alba*, in full flower at the end of January. The two varieties, planted in juxtaposition as Mr. Kinghorn has them, give a very cheerful effect. Why should we not plant alternate lines of them for early spring effects, or group them in large shrubbery beds, as we do Ghent Azaleas and Rhododendrons? This is a very interesting plot indeed. A row of golden-topped Yews is planted by the margin of the rail fence bordering the main road, which is much admired by visitors and others interested in plants, and gives evidence of skill in treatment and cultivation. Then follows a selection of more graceful habited plants, including a very fine specimen of *Berberis stenoophylla*, which, when adorned with its rich orange flowers, which droop and overlap each other, is a pretty sight indeed. During the summer months single Dahlias, Hollyhocks, Marguerites, and other flowers are planted among the shrubs, in order to have a seasonable display at all times, by which a visit to the nursery is removed above the dull sphere of business to that of pleasure.

The first of two span-houses is crammed with plants in or coming into flower, and a sprinkling of other plants grown for the beauty of their leaves, and, therefore, useful and valuable for the approaching busy season of decorating and furnishing. But although the plants are now arranged "show fashion" it is evident they have had plenty of house-room during their season of growth, for they are as perfect in form and as healthy as plants need be. The centre row,

elevated above the rest, consists of *Aralia Sieboldii*, with large glossy leaves, indicating both substance and vigour—the remainder of the plants on the centre stage being very fine samples of *Cytisus racemosus*, from one to three years old, just coming into flower: these plants are numbered by the thousand in this house alone, and in addition the side stages are bright with Cyclamens, Primulas, Hyacinths, Tulips, and *Erica persolata alba*. There are some grand spikes of Hyacinths, including Charles Dickens (blue), and Grande Vidette (white), popular kinds of the first order. The next house, by the side of the one just noticed, is the conspicuous house of the nursery. It not only contains the finest and most valuable plants, but it is also the largest, in fact the central figure of attraction in the whole establishment. Mr. Kinghorn is his own architect and builder, and he evidently intended, when designing the house, to be able to sleep soundly during the equinoctial or other gales, for the substantial construction of the house renders it proof against all weathers. It is, however, while simple and substantial in design, also ornamental in appearance. The house is over 90 feet long and 20 feet wide, with a brick pit in the centre, and a flag path all round. The pit is low, in order to provide head-room for tall specimen plants. The house is supported by upright iron columns and horizontal cross stays fastened to both sides of the roof. Oblique bars of the same size are also used to tie the sides of the house with the roof, so that it is secured at all points against the violence of the weather, from whatever quarter it may proceed. All the ironwork is painted blue as a contrast to the woodwork, which is a clear white, and where the ironwork is not heavy the two contrasting colours have a very lively appearance. The hot-water piping is arranged in single rows above each other, by the sides of the paths, where the heat directly ascending from them does not come into immediate contact with the roots or leaves of plants.

Large Palms occupy the centre of the house, well raised up, and intermixed with *Pandanus Veitchii*, fine plants of which are splendidly coloured. The specimens in the centre consist of *Lantana borbonica*, *Scapharbia elegans*, *Arca lutescens* and *Verschoffii*, *Chamaedorea glaucitola*, *Phoenix reclinata*, *Chamaerops Fortunei*, and many other popular kinds suitable for general purposes of furnishing. These plants are not grown by the score or hundred, but by the thousand. Of *Lantana borbonica* 10,000 plants are grown, and others in proportion. Nor must it be understood that small quantities of anything mentioned are grown—all are cultivated by the hundred or thousand, according to their popularity, and in sizes varying from the young seedling to the specimen ready for exhibition. There is another point in the cultivation of these plants which is deserving of mention, and that is, that such a thing as insect-pest of any kind is not tolerated, owing to the strict supervision under which the plants are cultivated. Indeed, the health and cleanliness of the whole collection cannot be excelled.

But to proceed with a notice of the plants that seem to be the most largely grown, the two *Dracaenas*, *rufra* and *congesta*, so commonly used for furnishing, are here grown in immense numbers, clearly proving the popularity of these well-known varieties for decorative purposes. Mr. Kinghorn has a large stock of the "true variety of *rufra*" which is not so common as people think. There are several varieties which are easily distinguished in a large collection, when seen growing side by side with the true variety, which have no claim to the title of *rufra*, although in other respects they are not so unlike in appearance. There is a green variety of pendent habit after the style of Cooperi, which requires cooler treatment than the true *rufra* to keep the leaves in their normal rigid state, which makes an excellent table plant, and of which large quantities are grown by Mr. Kinghorn. The same characteristic is noticeable in the stock of *Dracaena congesta*. Some of the plants have much broader leaves than others, while many more have the leaves more thickly produced on the stems, and are gems of their kind for decorating rooms in "pairs to match," or indeed for any modern purpose of decoration.

It is a great advantage to be able to compare notes, or rather to take notes, of the different varieties of certain species of plants, all of which are erroneously supposed to require the same treatment and temperature, whereas, upon becoming better acquainted with their habits and characteristics, we find how accom-

modulating many of them are, and how well they stand a moderately low temperature, which enables amateurs and others to enjoy the possession of plants which under other circumstances would be useless to them. Arent the existence of so many varieties, they are of course obtained from seed, but Mr. Kinghorn takes care that choice kinds are perpetuated from cuttings only, so that the stock of plants may be kept perfectly true to name.

Next to the plants already mentioned the stocks of Ferns are the most interesting and useful. It is a rare sight indeed to see *Pteris tremula* with such fronds and the plants grown in 6-inch pots; also young *Dicksonias*, *Asplenium Delangeri*, *Pteris serrulata cristata* (the common variety), and many other kinds for cutting and furnishing, including *Laetrea opaca*, quite handy. Thousands of *Erica gracilis* are in this which is housed on shelves near the glass; sturdy little plants of their kind, looking thoroughly prosperous and healthy. The main block of houses upon the north side of these, although not so showy to look at, is equally useful for plant growing—most of them could not indeed be much better for the different purposes for which they are required. The collection of stove *Draenas* occupies the greater part of a house by themselves, and comprise well grown plants of Mrs. Willis, D. Kossi, anerylensis, Frederici, Salmonia, Mrs. C. J. Freake (very finely coloured), and many others; also *Crotons* and *Aralias* in variety. Another house contains a healthy and numerous stock of *Corypha australis*, *Ficus elastica*, and *Azaleas*. The collection of *Camellias* (also occupying the greater part of a house to themselves) consists of several choice specimens, of which a large bush of elegans is a show in itself, its pretty pink flowers being very conspicuous among scarlet and white and colours of various other tints. In this house also there is a good stock of the red and of the white *Lapageria*, and some beautifully grown specimens of *Todea superba* in a glass case, where they are specially attended to.

From the *Camellia*-house the visitor proceeds through extensive ranges of houses filled with soft-wooded plants, chiefly *Pelargoniums* and other useful subjects, such as *Rapala corcovadensis*, *Eurya latifolia*, golden *Euonymus*, and *Azaleas*. Other houses are stocked with *Ophiopogon spicatus*, *Aralias* of sorts, Maidenhair Ferns, *Abutilons* of all kinds in cultivation, *Epacris*, *Ficus elastica*, *Aspidistra lurida variegata*, and many others. The stock of show and fancy *Pelargoniums* consist of all the leading kinds, such as Digby Grand, Triomphe de St. Mandé, Duchess of Edinburgh, and La Patrie, which are grown under exceptionally favourable conditions in light-span-roofed houses, where they enjoy abundance of light and air, and are therefore stocky and hardy in addition to being handsome in shape, with leaves covering the rim of each pot. *Primulas* are equally well grown, the old double white still being a great favourite in this nursery. Stock plants of *Fuchsias*, *Solanums*, *Bouvardias*, &c., are counted by thousands, most of them indeed showing signs of active growth, and producing healthy cuttings at every joint, which will soon be ready for the propagator to commence operation for another season.

The next house, or rather pit, is filled with small *Palms*, 2000 *Cocos Weddelliana*, and equal numbers of *Latanias*, *Scaevolarias*, *Phœnix reclinata*, *Areca lutescens*, and others. From this interesting department, the visitor is taken to a north house filled with *Camellias*, *Azaleas*, greenhouse *Rhododendrons*, golden *Euonymus*, *Clematis*, and small plants of *Acaëa Ricana*, which makes the finest of conservatory bushes when planted out. Upon the south side of this house, a lean-to structure is filled with *Pelargoniums*, *Crasulias*, and Ivy-leaved *Pelargoniums*; the latter in grand trim and in great variety. A span-roofed Heath-house, running north and south, contains over 2000 plants, of one single variety—*Erica gracilis*; and the propagating-house already shows signs of briskness and preparation for the spring season. Pits and frames are filled with thousands of *Ericas*, *hymcalis*, *gracilis*, and *Caëra ventricosa*, also *Chrysanthemums*, young *Conifers*, and over 5000 Golden *Euonymus*. *Epacris* of sorts occupy a considerable area of pit-room, as also *Ceanothus*, *Gloire de Versailles*, *Veitchii*, and *divaricatus*. I noticed a very superior stock of Grape Vines in fine condition for planting, and an endless variety of herbaceous and alpine plants.

Talk about *Hellebores*: they are here by the thousand—white, or brown, or green, as the cultivator may choose to purchase them. For the writer's

part he still gives preference to the white varieties, and he would advise inexperienced purchasers to do the same, or at least not to purchase largely of the many varieties recommended without a trial. Large beds of *Euonymus* and other plants requiring partial protection in a young state are in a very satisfactory condition after the mild winter, and promise to shoot ahead vigorously during the coming season of growth. The outdoor nursery stock consists of the usual variety of ornamental trees and shrubs, *Conifers*, fruit trees, and *Koses*. A choice selection of all the finest plants are well arranged in borders on either side the principal walk before referred to. The walk itself is ornamented with two fine Weeping Elms, one planted about its centre, and the other at its extremity bordering upon the South-Western Railway. The weeping trees forming the back row are both choice and numerous, as also the great body of other plants, including *Juniperus chinensis*, *Cryptomeria elegans*, *Keteleporas*—all the leading kinds, *Cupressus* of sorts, *Thuysas*—all the finest kinds, and a sprinkling of spring and summer flowering shrubs. The great features, however, of the borders in summer are the pillar *Roses* and *Clematis*, which have an exceedingly graceful effect, and which are far too sparsely used in private gardens.

The specialties in outdoor stock consist largely of *Limes*, *Poplars*, *Chestnuts*, over 15,000 *Aucubas*, *Clematis*, a fine stock of *Deutzia scabra*, thousands of *Fives*, dwarf *Roses*, *Euonymus radicans variegatus*, *Rhododendrons* in bud in all the best hybrid kinds, brakes of *Conifers*, quarters of fruit trees, and young stocks of *Caucasian* and other *Laurels*, flowering shrubs, &c. Before concluding this notice I may mention two fine samples of plants that are very uncommon which are within the gates of this nursery, and which would make elegant specimens planted singly in pleasure-grounds, if, indeed, they are to be readily obtained. One is the Chinese Lace-bark Pine (*Pinus Dungeana*), and the other *Torreya grandis*, a plant well named, but if appearances go for anything it bears a close affinity to the genus *Taxus*. W. H.

The Arboretum.

NOTES ON WESTERN CONIFERS.—In another publication I intend to give a full account of the observations on *Conifers* made in the Pacific States, when with Professor Sargent and Dr. Parry I explored their forests, but it seems proper that I should not withhold any longer the principal results arrived at.

Abies amabilis (Douglas), Forbes, is not a variety of *A. grandis*, as I had assumed; but a very distinct species peculiar to the higher mountains of the Cascade Range from Oregon to British Columbia. It is easily recognised by its dense, dark green, glossy leaves, very white underneath, usually emarginate, but on the fertile branchlets acute; by its large very thick purple cones, and oblanceolate acuminate bracts. [See *Gard. Chron.* 1880, vol. xiv., pp. 720, 725.]

Abies nobilis (Douglas), Lindley, is peculiar to the higher mountains of Oregon, and has not yet been found in California, nor, as far as I can learn, in Washington Territory. Its grooved leaves crowded on the branchlets, and its large purple cones with long exsert recurved bracts, well characterise it. The tree on Mount Shasta, which has gone by this name (also in the Flora of California), is distinguished by its quadrangular leaves, keeled on the upper side; its large cones considerably resemble those of *nobilis*, and have often, not always, exsert and recurved bracts; it is a form of *A. magnifica*, Murr., the common Red Fir of the Californian Sierras, which has bracts normally enclosed.

Pinus reflexa, n. sp. (*P. flexilis* var. *reflexa*, Eng. in Rothrock's *Rep. Bot. Exp.*, Wheeler), proves to be quite distinct from *flexilis*, not only by the reflexed scales of the cone, but also and principally by the long peduncled cylindrical female anthers, erect in the first, recurved in the second year, which associate it with the true *Strobbi*, while the large wingless seeds distinguish it from the other species of that section.

P. albicaulis, Eng., is specifically distinguished from *P. flexilis* by its subglobose purple cones with short, thick scales and its thin white at last scaly bark.

P. chihuahuana, Eng., observed by us in the Arizona Mountains, proves to be of peculiar interest as maturing its cones in the third year, the only American species with this character, which I have found only once more in the Mediterranean *P. Pinæa*.

P. Jeffreyi, Murr., holds its characters well wherever we have seen it from the mountains west of Mount Shasta, where it was first discovered, down to the San Bernardino Mountains, affecting more particularly the eastern slopes. The glaucous branchlets, with pleasantly aromatic fragrance, thinner glaucous foliage, the great size of the cones, with thin, spiny recurved mucro on the scales, large seeds and more numerous cotyledons, distinguish it from *P. ponderosa*, which has brownish-green branchlets, with a turpentine odour, and dark green coarser foliage.

Pinus arizonica, Eng., has also been repeatedly collected by us as well as by subsequent explorers, and the question has been agitated whether it may not be also a form of *P. ponderosa*. The fact is that five-leaved forms of this species do occur on the Californian Sierras (Lemmon) and on the Arizona Mountains (Lemmon, Pringle), but the larger number of leaves is here a casual occurrence; the branchlets show the brown-green colour noticed above, the leaves are dark green, and have the structure described by me in Wheeler's report. *P. arizonica* has glaucous branchlets, thinner leaves, constantly in fives, and of different structure; its cones are thicker and shorter, with much more prominent umbos, but with so much weight can be put on this last character. G. Engelmann, in the "*Botanical Gazette*."

DRACÆNA ELLIPTICA.

NOT long ago we had an opportunity of figuring *D. Goldieana*, and now, as a contrast to it, we lay before our readers the portrait of another *Dracæna* which flowered in Mr. Bull's establishment about the same time as the *Goldieana* (fig. 37). The plant has long been known, and was figured in the *Botanical Magazine*, t. 4787. The species is mentioned by Mr. Baker as occurring in North-East India and in the Malayan Islands. The variety figured has the leaves spotted with white, hence the name *maculata* given to the variety in question. The real nature of the inflorescence is the same as in *Goldieana*; but in this one the main stem is elongated in place of being contracted. The greenish flowers were observed by Mr. Smith to be protogynous, that is, the stigmas were ripe before the anthers, and protruded beyond the flower even in the bud stage, as shown in the figure, so that access of the flowers' own pollen was impossible. The flowers, therefore, though structurally hermaphrodite, are, as in so many similar cases, functionally unisexual at any given time. This separation of the sexes is carried a step further, as Mr. Smith figures some of the flowers with imperfect stamens only, others with perfect stamens and no ovary. The pollen is stated by Mr. Smith to be precisely like that of *D. Goldieana*. In the figure the plant is shown of natural size, and the floral details magnified.

NEW ZEALAND GRASSES.

TRIODIA ENIGMA, T. Kirk, sp. nov. (*Danthonia pauciflora*, Buchanan, *Grasses of New Zealand*, t. xxxvi. n. 1; not of K. Brown.—A small grass, forming a compact sward, root creeping, leaves tufted, 1 inch long, filiform, rigid, involute, pungent, glabrous, mouth of sheath clothed with a minute pencil of hairs, ligule o. Culms 1—2 inches high, slender, naked above; panicle reduced to a single spikelet, or rarely two, when the lower spikelet is pedicellate. Spikelets 2—3 flowered, empty glumes larger than the flowering, obtuse, flowering glume three-toothed at the apex, ciliate, nerved palea notched at apex. Caryopsis free.

Habitat: South Island, Canterbury, Broken River basin, 2500—3000 feet. Terraces of the Upper Waimakiriiri, 1600—2500 feet (J. D. Enys and T. Kirk); Otago, Mount St. Bathans, and many places in the interior of the district (D. Petrie).

Mr. Enys and myself collected a few specimens of this grass several years ago, but as the season was so far advanced that little more than the outer glume remained, it was not possible to make out its affinities. Last year Mr. Enys visited the locality, and kindly sent me a supply of good specimens; I am also

indebted to Mr. Petrie for good specimens from Otago. In his *Indigenous Grasses of New Zealand* Mr. Buchanan has wrongly referred Mr. Petrie's plant to *Danthonia pauciflora*, Brown; but it is clearly a *Triodia*.

Triodia exigua occurs in great abundance in the

informs me that horses are especially fond of it, notwithstanding its dwarf habit.

Danthonia pauciflora, of Brown, is a more robust grass, with keeled leaves and culms, with sub-erect or drooping panicles, which are usually more or less branched, while the flowering glume is never three-

linear oblong, strict, rarely exceeding 1 inch in length, simple or with one or two short branchlets at the base. Spikelets minute on short capillary pedicels, 2-3 flowered, outer glumes unequal, obtuse; flowering glumes convex obtuse with five faint nerves; palea ciliate at the apex. Caryopsis oblong, free.

FIG. 37.—DRACENA ELLIPTICA MACULATA. (SEE P. 260.)

Broken River basin and in the Waimakiriri terraces, often forming a close sward, to the exclusion of all other grasses. Its red anthers, as I learn from Mr. Enys, give a perceptible tinge to the pasturage, which catches the eye when riding. Nearly all the specimens in this locality have the panicle reduced to a single spikelet. Some of Mr. Petrie's specimens are more robust, and exhibit two spikelets, the second, however, being often imperfect. Mr. Enys

toothed, and the lodicules are never ciliated, as in our plant. It has not been observed in New Zealand.

ATROPIS PUMILA, *T. Kirk, sp. nov.*—A slender tufted grass, 2-8 inches high, leaves 1-2 inches long, spreading, filiform, involute, with a minute pencil of hairs at the mouth of the sheath, and a few loose hairs at its base. Culms erect, extremely slender, leafy for over one half their length, panicle

Habitat: South Island. Common in the Otago district at an elevation of from 2000-3000 feet. D. Petrie.

This is one of many interesting plants added to our flora by Mr. D. Petrie, to whom I am indebted for all the specimens I have seen at present. It slightly resembles some forms of *Danthonia nuda*, but its nearest ally amongst New Zealand grasses is *Glyceria stricta*, Sm. *T. Kirk, F.L.S., Canterbury, New Zealand.*

Orchid Notes and gleanings.

WORK IN THE HOUSES.—With the view of bringing the plants into a little more active growth with the lengthening of the days, a slight rise of temperature in all the houses will prove to be beneficial. The 1st Indian-house should now stand at 65° by night and 70° by day; the Mexican-house 60° by night and 65° by day; cool-house about 53° at night, and from 55° to 60° during the day; but should much fire-heat be needed to maintain these temperatures in the cool-house, it will be safer to lower them about 3° day and night. Any plants of *Odontoglossum* or *Masdevallias* in this house that need re-potting, or fresh surfacing, should now be done. All our plants of *O. crispum* that have recently flowered will be gone through during next week. The compost we use for this and most of the *Odontoglossum* is equal parts of selected peat and good sphagnum moss. The peat is first partially dried, and then rubbed through an inch mesh sieve; this process disintegrates it thoroughly; when we put a small quantity at a time into a sieve, the bottom of which is made of perforated zinc, and through this all the earthy matter is got rid of, and the fibry matter only retained. The sphagnum moss is chopped a little, and the two are thoroughly blended together. This, with a dash of silver-sand and a moderate quantity of charcoal pounded pretty fine, forms our favourite compost. In a soil prepared as above described there is very little cohesion, and the sand is only added to fill up the interstices of the soil, and as a root-preserve also. The effect of the charcoal is that it tends to keep the foliage of the plants a good colour. Too great cohesiveness in the soil would round the roots of most Orchids has long been the bane of Orchid growing. When we see cool Orchids retain their old foliage for four or five years, and the plants continually gaining strength, flowering profusely, and often making double breaks, we may rest assured that this condition—the standard of excellence—has not been brought about by using pasty soils, as it is impossible to retain the roots more than a season or two in such soils, and as fast as the roots go off on the back bulbs the foliage is not slow in following suit. Many of the cool-house plants will now be in flower or showing their spikes, and any that may be in a weakly state or poorly rooted should be relieved of their flowers as soon as they open. The earliest plants of *Dendrobium Warlianum*, *D. nobile*, *D. crassinode*, *D. Pierardi*, and others that may now have finished flowering, should be taken in hand at once and receive a shift or resurfacing according to their requirements. Others, such as *D. clavatum*, *D. moschatum*, *D. Farmeri*, *D. thysiflorum*, and *D. densiflorum*, should be kept dry for the present, and if it is desired to retard them for early summer blooming they should be placed in a steady temperature of about 50° in a position free from cold draughts, with scarcely any water applied to their roots while in this temperature. In the East Indian-house the plants should now be beginning to root freely, and as these young roots are a favourite dish to the cockroach no effort should be spared to try and diminish the number of the latter, for it seems impossible to exterminate them. For their destruction we find nothing better than Chase's beetle poison, laying it in their haunts about twice a week for a short time, when we are generally free from them for two or three months. *J. Roberts, Gimmershury.*

ODONTOGLOSSUM EDWARDI.—This species, which was introduced two or three years ago by the brothers Klaboch, and named in compliment to the late Mr. E. Klaboch, is now in flower in the collection of Walter Cobb, Esq., at Sydenham. It is not only distinct from any other *Odontoglossum*, but distinct in colour from any other Orchid. Mr. Cobb's plant produced a large branched spike on which were 120 flowers. These are about 1/4 inch across, and of a deep violet-purple colour, except the crest of the lip, which is orange. The two colours remind one of a flower of *Iris reticulata*. Mr. Sander, by whom it was distributed, told me he had dried spikes with stems as thick as a man's finger, and the collector had counted nearly 1000 flowers on one spike.

If it can be grown like that in England, it will be indispensable in every collection. Mr. Cobb says it requires very cool treatment. *J. D.*

ODONTOGLOSSUM LONGIBEROUGHIANUM.—The largest plant, or rather moss, of *Odontoglossum Longiberoughianum* in Sir Trevor Lawrence's collection, has furnished a number of long-branched spikes. Mr. Sayers thinks highly of this species, and probably it has not had full justice done to it in some gardens. The flowers are distinct in character, their best feature being the clear golden-yellow lip; the sepals and petals of the same colour are barred with brownish-crimson.

CYPRIPEDIUM SPICERIANUM.—This remarkable and beautiful species has now been imported in considerable quantities, and we may expect to see it much cheaper than heretofore. Mr. Sander, by whom the consignment was distributed through Mr. Stevens, says that the collector found it growing on the face of almost perpendicular rocks which were very moist; indeed the leaves themselves showed the state in which they were found, as they were covered with mud. As a hint to cultivators, Mr. Sander says that the plants were found growing in loam, so that they will succeed in cultivation under the same conditions as *C. incanum*. The plants must also be placed in the warmest house. *J. D.*

BLOCKS FOR CULTIVATED ORCHIDS.—Some time ago Sir Joseph Hooker, in discussing the cultivation of tropical Orchids, suggested to me the advisability of growing such species as were suitable for the purpose on blocks made from the stems of Tree Ferns. I thought the suggestion a remarkably happy one, and proceeded immediately to carry it into execution. It will be remembered that at the base of nearly all the large Tree Ferns there is a large compacted mass of root-fibres (no doubt induced by the moist surroundings of moss, grasses, and vegetable debris usually accumulated there), measuring 3 or 4 feet in diameter, which admits of being sawn or cut, without breaking, into any shape desired. When carefully trimmed, blocks of this black mass, almost like charcoal, may be hung up in the Orchid-house by a hook or piece of wire; and they form, with the aid of some fibrous peat or sphagnum, a most congenial home for a large number of our smaller Orchids. Such blocks are superior to the coco-nut husks and blocks of wool ordinarily in use, as they keep sound for many years; and, moreover, are always sweet and clean, and never infested with rot or fungus. Those of your readers, placed within easy reach of districts where Tree Ferns abound, as in the mountain slopes of Jamaica, may have already tried the plan; if they have not the inevitable clearing of land for Coffee and Cinchona and the cutting down of these beautiful ornaments of our forests may, at least, be thus utilised. For the cultivation of such plants as *Compertia falcata*, the smaller *Epiphyllums* and *Oncidium*, *Ionopsis*, *Brassavola*, *Stellis*, *Pleurothallis*, *Octalemia*, &c., nothing could be better than these Tree Fern blocks. *D. Mori & Co., Jamaica, Jan. 29.*

ORCHIDS IN FLOWER AT BRENTHAM PARK, STIRLING.—The following Orchids are now in bloom in Mr. Smith's collection here:—

- Agaveum cirratum*
- Brassavola nodosa*
- „ *glauca*
- Burlingtonia candida*
- Cattleya choisyana*
- „ *Titum* (several)
- „ „
- „ *Vesta*
- „ *Venus*
- „ *Wardianum*
- „ *Wardianum* alba
- „ *amethystoglossa*
- Cymbidium Lowianum*
- Cypripedium magnum* (several)
- „ *Sedeni*
- „ *Eschallii*
- „ *Hookeri*
- „ *Argus*
- Collegiole cristata*
- Leontium*
- Dendrobium Pierardi*
- „ *latifolium*
- „ *Domaui*
- „ *aggregatum majus*
- „ *Wardianum* (several)
- „ *montanum*
- „ *primulinum giganteum*
- „ *notule* (several)
- „ *limbatum*
- „ *leucolatum*
- „ *leucolatum*
- „ *Furmei*
- „ *Somneri*
- Dendrobium glaucum*
- Epiphyllum evictum*
- „ *Wilckii*
- „ *latifolium*
- Lycia thalictroides*
- Lycia skauensis* (several)
- „ *alba*
- Masdevallia Estradae*
- „ *tovaraisis*
- „ *lignea*

John MacLeod.

The Flower Garden.

PLANTING.—The weather has been and is so favourable for the purpose that the planting of Roses, deciduous trees, and evergreen shrubs, &c., may still be carried on, but it is imperative that it should be brought to a close as soon as possible. So many things are now pressing for attention in the regular routine of operations, that unless there is an unlimited command of labour the gardener's hands ought not to be hampered with extra work at this season. It would be well for all concerned to remember that there are recognised times, the result of long experience, for the performance of certain operations, and that if this is not attended to at the proper time it will not be apparent at once, but the result will be certainly entail disappointment four, or five, or even six, months hence, when the cause has been entirely forgotten.

SHRUBBERIES.—In such a season as this has been, the digging of the borders of the shrubberies and re-arrangement of the shrubs should be well forward; the soil need only be turned over sufficiently deep to insure neatness of appearance, and to put fallen leaves and weeds out of sight. I do not agree with those who argue that this operation is superfluous, and ought not to be practised for the benefit of the shrubs, as I have observed that strong rooting sorts get possession of the ground, and gradually exterminate the weaker and often more valuable plants; but by annual, or in some cases half-yearly, diggings over, we ensure a neat appearance, a more certain destruction of weeds, and, by checking the strong surface-rooters, give the weaker a better chance. As this operation proceeds, the knife should be freely used upon such plants as Laurels, Portugal Laurels, Aucubas, Golden Yews, and other evergreens, to keep them in shape, and prevent crowding. Even such evergreen trees as *Thuja*, *Cupressus*, *Thuyopsis*, and other Conifers, may be greatly encouraged to grow thick and shapely by being shortened back freely, and notably so the *Deodar*.

BEDDING PLANTS, &c.—Plants of these in store-pots and boxes should be potted off at once, and immediate means be taken for the propagation of any sorts which may be deficient, particularly such as are usually required in large numbers, as, for instance, *Alternanthera*, *Mesembryanthemum cordifolium* variegatum, zonal *Pelargoniums*, of which the store plants potted up in the autumn, and forwarded in heat as before recommended, ought now to furnish plenty of cuttings for present propagation. Remember that they must have very little water until they are on the move; but the medium on which the pots are stood or plunged should be kept constantly moist.

HERBACEOUS BORDERS.—As the renovation and digging of these should now be in full progress, it may be as well to observe, that in rearranging the disposition of the plants a good effect may often be obtained by repetition of some conspicuous plants at equal distances throughout the mass, and a plant well adapted to illustrate the subject is the very common tall double white Rocket; *Agrostemma atrorubra* is another; it is the *Fritonia avaria* and *grandis*, and several others are conspicuous by their colour and habit for the production of good effect; but the principle must not be carried too far, or it will degenerate into formality. The entire interest of these borders consists in their variety, and they will generally present a mixed and sometimes muddled appearance, but the lover of plants will always appreciate their merits and beauty individually, and would not look for effect in a mass like bedding-plants, at the same time a determination of design may be admitted without detriment (if not carried too far; and whilst on the subject I would particularly recommend the *Hydrangea paniculata* *grandiflora* as a plant well adapted for the purpose in the autumn. It is impossible to speak too highly of the usefulness of this very fine flowering plant, and where cut flowers are in much request it is invaluable; it should be well cut back every year. *John Cox, Redleaf.*

- Masdevallia ignea superba*

Grapes and Vineries.

THE Grapes in the earliest vinery will be swelling fast, the mild weather being very favourable for forcing. Still keep the night temperature at 65°, and raise the temperature to 75° early in the day if the weather is bright, and admit air on the back ventilators early in the morning. Close early in the afternoon so that the thermometer may run up to 85°, and keep the evaporating pans filled with weak manure-water. Damp the paths and borders down several times daily with tepid water, but use much less atmospheric moisture on dull days. As a general rule, when the Grapes are swelling, no stopping is required; but sometimes a few laterals will require taking out if the Vines are very strong. Water the border thoroughly when dry with tepid manure or guano-water at 85°. Attend to the fermenting material on outside borders, and add fresh manure and leaves as the heat declines. Succession Hamburghs started in the early part of the year will soon be coming into bloom, and must be kept at 65° at night, with a rise of 10° by day. Tie the young growths down to the trellis, and stop them just before they come into bloom, and then let them go until they are set. It is a good plan to water the inside border a few days before they come into bloom, so that no more water will be required until they are set and thinned. If many bunches show cut off the surplus before they come into bloom, as the others will set better. When in bloom keep them as advised in previous Calendars. Muscats started on January 1 will be showing bunches, and can be kept at a night temperature of 67°, raising it to 70° when they are in bloom. Stop them at about four joints beyond the bunch, according to the room there is on the trellis, leaving sufficient to cover it without crowding. Water when necessary with clear tepid water, for if the borders are well drained they will take liberal supplies. Admit air early in the day on all favourable occasions, taking care to avoid cold draughts, and close the house early in the afternoon. The latest house of Muscats can be started now or left a few days longer, say till March 1. Before starting water the border thoroughly with clear tepid water at a temperature of 85°. If any borders of late houses require top-dressing do it at once, so that it can be completed and the houses be thoroughly watered before it is time to start them, for all late Grapes ought to be started gently by March 1. When starting such late varieties of Grapes, as Lady Downe's, Alicante, and Gros Colmar, keep them at a night temperature of 50°, with a rise of 10° by day. Keep the rods well syringed several times daily, and the paths and borders well damped down with tepid water. Late houses of Hamburghs must have the ventilators open night and day, for if this mild weather lasts there will be great difficulty in keeping them back. Early pot Vines must now have liberal supplies of tepid manure-water at the roots, and if wanted very early they will now stand a few degrees more heat in the day time, but 65° is sufficient for the lowest night temperature. Vine eyes in pots or on turves can be kept at 55° to 60° at night, with a rise of 10° by day. Late Grapes hanging in the fruit-room will not require any fire-heat if the temperature does not fall below 45° and the atmosphere is dry. Fill up the bottles with soft water as they require it. *Toshua Atkins, Lockinge Gardens, Wantage.*

The Pine Stove.

FRUITING plants in various stages should have every facility afforded them to make a sound growth, and all due precautions should be taken that no check occurs to diminish the size of the fruits. Attend assiduously to the ventilation and temperatures for the next six weeks, as any inattention during that time will affect them the whole season. Keep all fruiting plants about 70° at night, with a rise of 10° by day, and close the houses up early, so that the temperature may rise as high as 85° for a short time. Do not keep to a rigid line, but rather be guided by the state of the weather. The bottom-heat for fruiting plants should be kept steady at about 60°. Carefully examine all newly made up beds, and if they are too hot lift the pots, which will make an opening for the rank heat to escape. Let the atmospheric conditions be equable and genial, but if too much moisture should accumulate in the axis of the leaves change the conditions by decreasing the moisture until the water has

evaporated. Keep the newly potted plants about 65° at night, with a rise of 10° by day, and in mild weather, with the aid of sunshine, it may rise to 80°. Give them a little air on every favourable opportunity, but ventilate cautiously. The plants should be plunged near the glass, with a south aspect, and the glass should be kept clean both inside and out, so that all the light possible may be diffused over and among the plants. These plants at this stage require careful watering for the next two months, and the soil should only be kept moist; if too much water is given the young roots will rot. The making up of hotbeds should be completed without delay, so that time is allowed for the heat to subside; make them of a good size, and build up the sides firmly, using the longest litter for this purpose, and let the inner layers bind the sides together, which will prevent them giving way. Use about two-thirds oak leaves and one-third long litter. Place the frames over them as soon as the beds have settled down; this keeps out the rain and prevents a too rapid decomposition of the materials—a point of importance in Pine beds. Those rooted suckers that were not large enough for putting into fruiting pots this month should have a small shift into 8 and 10-inch pots; these will form a second batch for transferring into fruiting pots during May. This, with the early lot, will form the principal succession for next year's fruiting. Those who only grow a few or a medium number should pot at either of these times, as they are not only more easily managed but the fruiting is more dependable and results alike satisfactory. *D. Wilson, Castle Hill, Devon.*

The Hardy Fruit Garden.

THE slightly lower temperature we are experiencing with the lengthening days will prove advantageous in retarding the already too advanced buds of fruit trees, which were certain to be more rudely checked later, had they continued to advance as rapidly as they were doing. Those who leave the pruning of their Peaches and Nectarines until the spring will do well to proceed with such work without any undue delay, in order to have the work executed before the buds become so far developed as to be easily broken off in the performance of the operation. Where the whole of the available space on walls has not been covered, branches required for extension may be left entire, or of such length as the ripeness of the wood justifies. Growths in the interior of the tree that have borne fruit can be cut out and replaced by the shoot arising from the lowest break of last season. Prune such shoots of a suitable length to reach nearly to the next above, and do not risk crowding the tree by retaining more than are really necessary for the furnishing of the wall with growths at such distances as will allow of full development of the foliage without that of one branch overhanging that of another.

The growths being generally well ripened this season, and very full of bloom-buds, more than a sufficiency of bloom, if protected from frost, may be expected to set on trees with even sparsely arranged shoots. Should any gross growths that destroy the balance of the tree have been suffered to remain unchecked last season they should be entirely removed to prevent the emission of others of a like nature, which would result from cutting back such shoots at this season. If it be necessary in order to furnish thin portions of old trees with blooming wood to retain some of the weaker growths, see that a wood-bud be retained by putting in the shoot at full length if no triple buds exist. In nailing-in use no more fastenings than are absolutely necessary to straighten the shoot and support the probable weight of the crop, and avoid ugly bends at the base of shoots by fastening into a sufficiently acute angle with neat matting ties. If the trees are entirely retained, as Peaches ought to be, there will be no need for noting the necessity of looking carefully after the removal of all tight ties, which work especial injury on all fruit trees liable to form gum when the bark is broken. Young trees can have all weak growths cut

well back where required to form branches, or removed entirely where not wanted in the formation of the tree; and well ripened strong shoots can be nailed in at full length, trusting to after-attention in restricting the summer growth where necessary to improve the balance of the tree. The leader can be well cut back, in order to furnish a sufficiency of shoots for the centre of fan-trained trees, or for modified forms of the same. Strawberry plantations may now have all old leaves cleared away, also weeds where such exist. The decayed manure may then be lightly pointed in with digging forks, carefully avoiding injury to the roots in executing the work, and if convenient a good dressing of long stable litter may be at once applied, which if thickly used will last in good condition until the fruit is ripe, and will have more time to be washed thoroughly clean than when applied late in the season. Where it is intended to make spring plantations of Strawberries from stone beds the work may be proceeded with at once on well prepared ground which has been thoroughly enriched.

Raspberry plants for autumn bearing must now be cut over close to the ground, and new or extended plantations may be made at the present time, choosing an open situation well exposed to the sun, which is so necessary to the proper ripening of the fruit maturing in October, and which helps to arrest its speedy decay in damp weather. Where the tops of other Raspberries are left at full length until the spring, they may now be cut back to a little above the stakes or wires, and the surface-dressing applied in the autumn can be worked over, and the rougher portion removed for the sake of appearances. Now that the pruning of fruit quarters is all completed, and the faking over of fruit borders done, the department ought to present a neat and dressed appearance throughout, and if any arrears of work of any description, yet remain they ought to be seen to at once, before it is too late and a season lost. *Ralph Crossing, St. Façan's Castle.*

The Orangery.

THOSE trees from which all the fruits have been gathered may now be re-potted, and any that do not require it should be surface-dressed. Sometimes the drainage becomes imperfect, and does not allow the water to pass through freely. When the trees are turned out of the pots, and it is found that the ball of earth is packed full of healthy roots, a pot one or two sizes larger will be required; put in plenty of drainage, and some tough fibrous loam over it. The potting material should be good moderately clayey loam, with a fourth part of rotten manure and some crushed bones added to it; some broken bits of charcoal will also help to keep the soil open. The compost must be packed in firmly round the sides of the ball. When the roots are not in good condition it may be necessary to pick out a considerable portion of the compost from amongst them, and in that case the trees may be transferred to the same sized pots. When surface or top-dressing only is required, the surface soil should be removed as deep as possible, so that the roots are not materially injured. The compost used to replace this should be rich, and contain a double quantity of manure and loam to that used for potting. The position of the trees in the house is another important element in their culture. We have always grown them on the back stages of the Pine-stove or Cucumber-house, as they require the same treatment. I find, however, that the trees keep in better health, when the pots can be plunged to half their depth in a bark bed, with a bottom-heat of about 55°. It will be a good opportunity when working amongst the trees to wash the leaves and stems with strong soapy water. Treat the trees that may have fruit ripening on them to a temperature of 65° at night. Those that have ripe fruit on them should be in a cooler drier atmosphere and be kept rather dry at the roots. *J. Doolittle.*

TOBACCO IN KAFFRARIA.—Our contemporary, the *Colonist and India*, says Tobacco has long been grown successfully in Kaffaria, and its cultivation is rapidly extending. On a farm about 15 miles from the mouth of the Kl. Mr. Keightley is planting out about 9000 plants. In virgin soil the weed grows most luxuriantly, quite rivaling anything produced in America or elsewhere.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Feb 27	Sale of Imported Orchids, at Stevens' Rooms.
WEDNESDAY,	Mar 1	Sale of Imported Orchids, Lilies, Hardy Plants, Bulbs, &c., at Stevens' Rooms.
THURSDAY,	Mar 2	Linnæus Society's Meeting at R.F.M. Rooms.
FRIDAY,	Mar 3	Sale of Imported Orchids, at Stevens' Rooms.
SATURDAY,	Mar 4	Sale of Hardy Plants, and Bulbs, at Stevens' Rooms.

THE annual PRUNING OF THE SHRUBBERY is one of those things that is too often pushed aside through stress of other matters, or wholly ignored or neglected; and yet, perhaps, there is not a more important matter within the entire range of gardening. We do not mean by this that all shrubs are to be cut back or beheaded as Gooseberry and Currant bushes mostly are, but rather that they should be looked over and moulded into form or kept within bounds, as the case may be. The common practice of planting shrubberies in mixtures renders this the more imperative, for, with the different species and varieties found in most shrubberies, the predominance and final prevalence of the strongest speedily ensues, unless the more robust are repressed, and the weaker are encouraged by wise and judicious pruning.

In other cases, too, where shrubs, such as Laurels, Yew, Box, &c., are planted in groups to form masses of verdure at given elevations, it is needful to prune them in a more formal and regular manner; otherwise what was designed for a green carpet often grows up into anything rather than green blinds. Good illustrations of this style of planting may be met with at Dalkeith, and many other places in Scotland, Sandringham, Eastwell Park, and many more in England. Such verdant carpets need cutting almost smooth once or twice a year, as otherwise they soon get out of condition. The question now before us is, not the policy of planting such masses in situations where grass might be more telling, effective, or enjoyable, but the necessity of care in pruning such masses where they exist, so as to keep them even as a bowling-green, and green as the best velvet lawn. This used to be attempted by clipping the surface even; but it was found that the shears cut so many leaves in halves and mutilated so many more, as to ruin the appearance as well as impair the health of the shrubs; so that now the knife is generally used, and with such skill, that not a mutilated leaf is seen, and hardly a twig seems out of place. But the pruning, or rather beheading of such shrub masses is simplicity itself compared with the pruning of mixed shrubberies in such a skilful manner as to bring out all the most telling features of each specimen and group in due prominence, without totally or partially hiding the effects of others. In such prunings, a good many plants may have to be cut right down to the ground, in order that they may form, as it were, a green base for others.

Inequality of height and distances are also among the most charming characteristics of the well managed mixed shrubbery. Originally planted at well-nigh equal distances, as most of them have been, to grow up rapidly into a thicket or screen, the greatest danger before them is that of growing up into dense monotonous masses, as like the masses of Laurel we have described as may be. But these are the very opposite of what a good shrubbery should be. The skilful pruner breaks up its uniformity by the process of keeping much of his material near to the ground by severe pruning. This not only fosters the rapid growth of the shrubs left intact, but adds by contrast to their apparent height. In this way it is possible, by pruning with skill, to create bold swelling projections and deep dark recesses, though the base line may be level. Of course, where these are varied, less pruning

may be needful, and what is given has far more effect. Laurels, Box, Rhododendrons, make admirable base lines for Hollies, Yews, &c.; and even where the shrubbery is mostly of one uniform character, such as Laurels, Hollies, Rhododendrons, &c., the effect may be very much heightened by encouraging the growth of many perfect specimens and groups among and above the others. Some of the finer and stronger growing Rhododendrons reach to the stature of trees thus encouraged to rise above the others, and indeed there is no single shrub that so much can be done with in the hands of skilful planters and pruners as the Rhododendron. Some of the species are very dwarf, others of them rise to considerable elevations, and their natural qualities and diversities of stature may be intensified by culture and treatment. Hence we often see Rhododendrons so dwarf and prostrate as to lie upon the turf, and others reaching up to the dignity of dwarf trees.

Hollies also form capital base lines as well as being among the richest furniture of shrubberies. Single plants or groups of these allowed to run up and out into full-sized specimens, are simply magnificent. With sufficient space to enjoy light and air all round, no plant needs less pruning than the Holly. But to maintain a good close base for cover or shelter, an annual pruning will probably be found the cheapest and easiest in the end. For nothing works more mischief among shrubs than the occasional slaughterings which some dignify with the name of pruning. Drawn up into a smothering thicket by overcrowding, the shrubs have become abnormally tender as well as weakly. Severe thinnings under such circumstances invite disease, arrest growth, and not seldom totally ruin shrubberies. Hence it is often better to stub up neglected shrubberies root and branch than to attempt to prune or cultivate them back to symmetry and beauty. The evil is in the neglect. Nothing takes a more severe revenge for neglect than the shrubbery. An annual examination or pruning is one of the surest antidotes to neglect. It lightens the work so very much to do it often, if possible annually; not that there may be very much to do every year, and so much the better. The mere examination will prove an antidote against neglect, and even neglected shrubberies may be resuscitated with skill, care, and patience. The pruner needs not only to know when and where and how to act, but also when to stop, the latter being the more important of them all.

As to the time to prune shrubberies no hard and fast lines are observed. Writing broadly, from October to March, inclusive, is the best time to prune deciduous shrubs, and from April to July evergreens. Though little has been said about the pruning of the former, it is as necessary to prune deciduous shrubs as evergreens, though it is seldom needful to prune them so often.

How many beautiful Lilacs have been helplessly ruined for lack of pruning? Fine bushes have run up out of sight for lack of timely and judicious cutting back. Bushy specimens full of bloom have grown into something akin to Willow stools for lack of the timely removal of suckers and the thinning of their heads; and the same remarks are almost equally applicable to Spiræas, Loniceras, &c. An occasional overhaul, an annual pruning, would keep each shrub in its place, and also enable it to fill its own niche to the best advantage; while it would also preserve and heighten the general effect of the entire shrubbery, and prevent it degenerating into seediness and weediness, which it too often does.

— FICUS ELASTICA.—We owe to Dr. TRIMEN the opportunity of figuring the remarkable group of indiarubber trees which bound one of the entrances to the Royal Botanic Garden at Peradenya, Ceylon (fig. 38).

The curious aerial roots, descending Banyan-fashion from the branches, and the bold, undulating buttresses which run along the ground, are very striking features, and must tend to prevent the trees from being overthrown by hurricanes. We cannot hope, even with the resources of a Kew, to produce such growth in this country, but as the means of travelling increase the numbers of those privileged to witness such marvels increase likewise. The mode of formation of these buttresses and the reason are not generally understood, and would form a good subject for further investigation. They are not confined to Figs, but occur on many other tropical trees, as may be seen in several fine sections in the Wood Museum at Kew. A figure of these buttresses, taken from an isolated tree, was given at p. 681 of our volume for 1873, after a sketch by Captain OLIVER.

— THE INTERNATIONAL POTATO EXHIBITION will be held in the Crystal Palace on the same dates as last year, viz., September 20 and 21. The schedule and general arrangements will be much the same as on former occasions. The Lord Mayor and Sheriffs have generously promised to open the exhibition with some amount of ceremony. We hear with satisfaction that a new and severe rule will be adopted to prevent the introduction of old varieties under new names.

— PARIS HYACINTHS.—Inquiries are being made with reference to a very early and hardy double-flowered Hyacinth known under this name. We have before us spikes of the pink form from Messrs. CANNELL, and there are also double blue and double white varieties. They are simply varieties of *H. orientalis*, and have not, in our opinion (we are speaking from the gardener's point of view), anything to do with the ordinary Roman Hyacinth (*Hyacinthus precox*), the history of which was given in the *Gardeners' Chronicle*, Feb. 1, 1879, p. 145. The Roman Hyacinth has nothing to do with *Hyacinthus Romanus*—one more proof of the inconvenience of using vague popular names instead of those which are subject to rule, and can be verified by those who care enough about the matter to take the necessary trouble.

— PIERIS SERRULATA CRISTATA.—Wherever there is much ferning to be done the "Chiswick variety" of this Fern should be cultivated as special ornaments for sitting-rooms or in suitable sizes for the dinner-table. The plant is somewhat expensive, owing to the fact that the stock cannot be raised from spores but by division, which of course renders it more valuable. It is, however, well worth its price; the points of the fronds are beautifully crested, and a pair of plants well grown and a good match would bear favourable comparison with anything else that could be mentioned as decorative subjects for a library or sitting-room. From experience we can also add that it stands gas well.

— BOTANIC GARDENS, TOMSK.—It has not fallen to the lot of many of our readers hitherto to have to address their letters to the Director of a Siberian botanic garden; nevertheless we hope that it may not be long before communications are opened up between the remote Siberian town and the rest of the horticultural world. A University has lately been founded there, and now M. SCHESTAKOFF is about to found a botanic garden there for the purpose of supplying the students with means of study, and of collecting together all the plants likely to resist the severe winters. Seeds can be sent by post to Tomsk, so that it is to be hoped that some of our amateurs and nurserymen will supply seeds to the Director, in return for which he will forward other seeds of shrubs, hardy perennials, and the like, from this region of North Central Asia. Funds are not forthcoming yet for the garden, so that M. SCHESTAKOFF will have an uphill task, but may rely, we hope, on the sympathy of his European confrères.

— PROLIFEROUS CONES.—Adverting to the cones alluded to and figured in a recent number (p. 112), Professor EICHLEN, the Director of the Imperial Botanic Garden at Berlin, writes that in his opinion the seed-scale is only an excrescence from the outer scale or bract, so that the two really constitute one leaf, and the bud or branch in the axil of the bracts in proliiferous cones are not to be considered as transformed seed-scales, but as axillary buds to the

composite leaf just mentioned. The *Sciadopitys* offers no exception to this explanation. M. VAN VOLKEM's remark as to the frequency of the occurrence of proliferation in this plant in Japan is interesting in relation to the great frequency with which *Cryptomeria* is similarly affected here. If some of our Japanese friends would kindly send profliferous cones of *Sciadopitys* in various stages they would be rendering a service.

— PRESENTATION TO MR. SAGE. — The *employés* in the gardens of the Earl of BROWNLOW at Ashridge presented MR. SAGE, on the 13th inst., with an illuminated address and a writing desk of Spanish Walnut, as a slight acknowledgment of the kindly interest he has shown in their welfare during the twenty-four years he has been Head Gardener at Ashridge. As we have before mentioned, MR. SAGE is about to take charge of Lord BROWNLOW's other garden establishment at Belton, Grantham, and it must be very gratifying to him to know that among the forty men and boys employed at Ashridge there is but one feeling—that of regret at his leaving—their loss being that of a good master and a true friend.

— "FLORA EUROPEA." — Prof. KANTZ, of Kolosvar, has published, under the title of *Klitzky's Griechische Flora*, the small fragment of a *Flora Europæica* drawn up by the late Prof. GRIESEBACH. Unfortunately it comprises but five orders—Ranunculaceæ to Crucifera, and is only interesting as showing what had been the author's intention.

— ESSEX FIELD CLUB. — We understand that at a meeting of this society to be held at Buckhurst Hill this (Saturday) evening, the desirability of directing public attention to the pressing necessity which exists that some means should be adopted for the protection of our native animals and birds from wanton destruction by gamekeepers and others will be brought before the Club by Sir FOWELL BUNTON, Bart., Verderer of Epping Forest. Zoologists, and lovers of Nature generally, whether members of the society or not, are earnestly requested to attend and take part in the discussion.

— THE SEASON. — "In the open air," Mr. BURBIDGE writes from Dublin, "we have *Chionodoxa Lucillie*, *Scilla bifolia*, *S. sibirica*, *Leucoium vernum*, *Narcissus Tazetta* var. *floribundus* (from St. Michael's Mount, Penzance), and one or two others of same race; *N. minor*, *N. pseudo-Narcissus*, *N. major*, *N. maximum*, all opening their first flowers. *Chionodoxa* is very variable; some small narrow-rayed stars very pale, nearly white in fact; others stout and broad-rayed flowers, nearly 1½ inch across, and dense blue, with clear white centre. *Anemone fulgens* and seedling *A. coronaria* bear their company. In the houses: our *Ouvirandra* has a leaf-blade 1½ by 5½ inches, petiole 4½ inches. *Corylogyne Lemoniana* is blooming nicely; so also *Cypripedium Dominicanum*, *Cattleya Warscewiczii* var. *dehata*, *Phalenopsis Schilleriana*, *Odontoglossum pulchellum majus*, *O. Rossii majus*, *Oncidium cucullatum* var. *atropurpureum* has been in bloom ten weeks, equal seven days, and is yet fresh and sweet-scented. *Jasminum gracillimum* opened its first flowers with an Irish sun to-day, Feb. 21."

— KOLOSVAR. — We have received the exchange list of the Botanic Garden of Claudiopolis, better known as Kolosvar (Hungary). Dr. KANTZ's zeal and courtesy are well known.

— ST. PAUL'S CATHEDRAL. — A "Lover of Trees" writes to *Land* to propose that a handsome tree should take the place of the statue of Queen ANNE, in front of St. Paul's. We have heard doubts as to the desecration of this Royal lady, and we cannot help doubting the confident assertion of the writer aforesaid, that "A Cedar of Lebanon or a Deodar Cedar would look majestic in this position, and would probably last for centuries as a memorial of the Victorian era. I have before suggested," says the writer, "that the QUEEN should plant a City tree. What better opportunity than this could offer?" What a valuable suggestion—a majestic Cedar of Lebanon or a Deodar in such a situation! Can the gentleman have meant an "Arbor-vitæ," but even that would not last for centuries in such a place. A "Lover of Trees" may love well, but he certainly does not love wisely, or he would laugh at the absurdity of his own suggestion; but perhaps he is anticipating the results of the Smoke Abatement

Exhibition, and the purification of the soil from gas contamination consequent upon the general use of the electric light; but it is impossible to account for the imaginings of one who would plant a Cedar of Lebanon or a Deodar in front of St. Paul's.

— ROYAL FLORA SOCIETY, BRUSSELS. — We have received the programme of the important exhibition to be opened in Brussels on April 30. The schedule comprises 132 classes, and is so drawn up as to include several features of interest. English exhibitors should put themselves into communication with M. LUBBERS, 26, Rue de Berger, Ixelle.

— INDIARUBBER IMPORTS FOR 1881. — From Messrs. DECHT, LEVIS & KAHN's caoutchouc report for 1881 we learn that the consumptive demand for all kinds of indiarubber was good throughout the year. Fine Para rubber realised the highest price of any in the market, commencing in January at 35 per pound, and advancing almost without interruption to 37.7½d. in May, declining in August to 36.3½d., and rising gradually again till it reached 35.9d. per pound in December. The total exports from Para to all ports are estimated at 930 tons, against 8450 tons in 1880—an increase of 550 tons against 1880. The imports into London and Liverpool have been 3855 tons in 1881, against 3765 tons in 1880, showing an increase of 87 tons. Of the total exports from Para, estimated at 930 tons, the United States have taken 5175 tons direct from Para, being again an increase of about 500 tons as compared with 1880. This, combined with the very heavy quantity taken from this country, shows a largely increased consumption in the United States.

— CORBULARIA MONOPHYLLA. — This lovely little *Narcissus*—one of the most charming of all hardy bulbous plants—is now in bloom in the herbaricæ department at Kew. It is planted out under a handlight in the open bed, the protection afforded it being directed more against superfluous moisture than mere cold. Mr. BAKER regards it as a white-flowered variety of the well-known *Hump-petticoat*, *Narcissus bulbocodium*, the *Medusa's Troop* of the French. The late Mr. GILES MUNBY placed on record in these columns for 1869 (p. 335) some most interesting particulars about this little gem. He says:—"Having had occasion to-day to consult my herbarium concerning the genus *Narcissus*, I was surprised on finding two bulbs of *Corbularia monophylla* with living leaves about an inch long. One of these bulbs I gathered at Oran (Algeria) in January, 1848, and the other at Tlemcen, on the frontiers of Morocco, on March 23, 1857. I immediately planted the bulbs and put them in my greenhouse, where I have no doubt they will flourish, and in all probability flower next spring after (for one of them) a rest of twenty-two years." These bulbs did produce flowers, as Mr. MUNBY expected. Somewhat similar instances of prolonged vitality under similar conditions are on record; for example, *Lewisia rediviva*, the figure of which in the *Botanical Magazine* was prepared from a plant which had undergone treatment calculated to destroy every vestige of life even in the most tenacious subjects.

— NOTTINGHAMSHIRE HORTICULTURAL AND BOTANICAL SOCIETY. — The first monthly meeting of this newly organised Society was held in the Society's rooms, Morley House, Nottingham, on Thursday, Feb. 16, under the presidency of Mr. S. THACKER. The Society has been inaugurated with the object of advancing the horticultural interest, and holding monthly meetings at which members are invited to read papers on any subject connected with gardening. At the first meeting Mr. FOWNALL, of Lenton Hall, read an interesting and instructive essay on "The Gardener and his Position," which was afterwards fully discussed by the members present. Mr. SWANWICK, of Sherwood Lodge, showed a fine specimen of *Dracæna Goldiana*, which was much admired; and from Mr. EDINGTON, of Woodthorpe Grove, came a very fine spike of *Lælia albida*, some flowers of which had been sent to Messrs. VEITCH, who expressed a very high opinion of the variety. The same exhibitor showed a fine collection of blooms of *Primula sinensis* remarkable for their size and colour. A vote of thanks was awarded the essayist and both exhibitors. We understand that the Society has every prospect of success, and is being taken up by the principal gardeners and amateurs in the neighbourhood. Although only a month in existence,

it already numbers upwards of fifty members and subscribers. The Honorary Secretary is Mr. JAMES DON, manager for Messrs. BARRON & SON, Nottingham.

— PLANTS OF ROMANIA. — Dr. KANTZ has now completed his enumeration of the plants of this region (Moldavia, Wallachia), originally published in the Hungarian *Journal of Botany*. The flowering plants amount to 1802 in number, 1573 of the number being *Tricetyledonous*.
